His doctrine fared just as badly with the politicians whom he offended, without exception, the conservatives by his revolutionary views, and the socialists by his conservatism. He arraigned no less all the religious sects and classes. Jew and gentile, man and woman, patriot and pacifist, were all criticized; for the roller of equality had levelled everything and everybody, and property constituted the only distinction—not, however, in Nietzsche's eyes; for he saw and asked: "Mob above, mob below! what to-day means poor or rich?" Thus, for the first 50 years after it was expounded, the teaching, despite the recognition of individuals, fell, as it were, between all stools; while its messenger by his countless opponents in every country, including Germany, was branded as misanthropist, madman, promotor of wars, infidel, dysangelist and corruptor of morals.

Nietzsche's Contribution.—A further and more dispassionate study of his philosophy must, however, lead to a different conclusion, particularly on the charge of irreligion, although it must be admitted that the firm rejection of Nietzsche's teaching by those who clung to the old beliefs is quite comprehensible. Nietzsche was a destructive genius of the first order, and his revolutionary movement could not but arouse suspicion and misunderstanding at the time. Men felt, if only unconsciously, the unprecedented acuteness and the novelty of his attack; for Nietzsche's vigilant eye descried all his opponents' weak points, and his psychological ruthlessness tore veil after veil from ideals cherished for centuries. Where his predecessors had seen vices, he saw virtues, or the possibility of virtues; and where they had

seen virtues, he saw vices, or the possibility of vices. His attack on Christianity was much more thorough than that of Voltaire, whose *"écrasez l'infâme!"* had really done no more than assail the outworks of the Christian stronghold, its dogmas and ceremonies, without however aiming at the inner core of the faith, the Christian ideal itself.

Thus Nietzsche's rejection of all the values which had been held most sacred for centuries inevitably made him the great solitary that he was. Such daring and scornful condemnation, such glacial negation, could not be understood at once or greeted with applause, especially as at first his very motives remained obscure. Nobody understood in the early days that his teaching against pity sprang from his love of healthy life; against morality, from his love of a higher ethic; and against patriotism from his desire for a united Europe.

Late and slowly the world began to change its mind about "the anti-antichrist" and to perceive that he was not merely "anti" but that the destroyer of the old tables of values was also a creator of new values. For in Nietzsche, destruction was accompanied by creation, wrath by blessing and his vehement "nay" by an equally emphatic "yea." His "nay" was directed at sickness, weakness and decadence, while his "yea" was for all those healthy instincts slandered and suppressed by the religion and morality up to his day. Nietzsche became the redeemer of these honest and virile instincts and endeavoured to make their corresponding lordly virtues contribute to a great vision which he had had of the future. This vision, conceived in ecstasy, he depicted with the versatile talent of a scholar, a musician and a poet and left to posterity a series of works which bear witness to his profound morality and are to be regarded in the highest sense of the word as religious.

BIBLIOGRAPHY.—*Translations: Complete Works,* trans. by Oscar Levy, 18 vol. (New York, 1925); a selection from the 5-vol. German edition of Nietzsche's letters, published under the title of *Selected Letters of Friedrich Nietzsche* (1921); Elizabeth Förster-Nietzsche, *The Young Nietzsche,* Eng. trans, by A. M. Ludovici (1912), and *The Lonely Nietzsche,* Eng. trans. by Paul V. Cohn (1915); Daniel Halévy, *La Vie de Nietzsche* (1909), trans. by J. M. Hone as *The Life of Nietzsche* (1911).

Books About Nietzsche: The number of books written about Nietzsche in various languages is so vast that it is possible only to select a few, some of which will be found to take up a critical attitude toward the philosopher: H. Lichtenberger, *La Philosophie de Nietzsche* (1898), trans. by J. M. Kennedy as *The Gospel of Superman* (New York, 1926); O. Levy, *The Revival of Aristocracy* (1906); J. M. Kennedy, *The Quintessence of Nietzsche* (1909); M. Mügge, *Nietzsche, His Life and Work* (1909); A. M. Ludovici, *Who Is To Be Master of the World?* (1909) and *Nietzsche, His Life and Works* (1910); G. Chatterton-Hill, *The Philosophy of Nietzsche* (1912); Georg Brandes, *Friedrich Nietzsche,* trans. by A. G. Chater (New York, 1914); A. Wolf, *The Philosophy of Nietzsche* (New York, 1925); J. N. Figgis, *The Will to Freedom, or the Gospel of Nietzsche and the Gospel of Christ* (New York, 1917); W. M. Salter, *Nietzsche, the Thinker* (New York, 1917); Charles Andler, *Nietzsche, sa vie et sa pensée,* 6 vol. (1920–28); J. Lavrin, *Nietzsche and Modern Consciousness* (1922); M. (O. L.)

NIEUPORT (Flem. NIEUWPOORT), a town of Belgium in the province of West Flanders. Pop. (1947) 5,062. It was the port of Ypres, and is situated on the Yser about 10 mi. S. of Ostend. At one time Lombartzyde was the port of the Yser, but in the course of the 12th century mud was silted up, and ships went further south to Sandeshove, where it was more navigable. This place became the *novus portus,* or Nieuport. It was strongly fortified in the middle ages and its siege by the French in 1488–89 is an episode of its heroic period. Under its walls in 1600 Maurice of Nassau defeated the archduke Albert and the Spaniards. It contains an ancient cloth market, a fine town hall and an old church, and outside is a lighthouse dating from 1289. More than once in the course of its history, the town has been completely rebuilt, hence its draftsboard plan, preserved even after the wholesale destruction of 1914–18.

Nieuport has one of the main artificial drainage outlets of the low country, the locks of Palingbrug. After World War I they were rebuilt in the form of six locks debouching on the canal of the Yser. They played an important part in the war, being the instrument of the famous flooding of the front on the Yser on Oct. 29, 1914; all that was necessary to submerge a large part of the district, under the enemy's fire, was to reverse the normal process; *i.e.,* to close the locks to the lower and open them to the higher water, so as to allow the tide to flow inland.

Nieuwpoort Bad, 2 mi. from the town, is a fashionable seaside resort dating from 1869.

NIÈVRE, a department of France, formed from the old province of Nivernais with a small part of the Orléanais. It is bounded northwest by Loiret, north by Yonne, east by Côte d'Or, east and southeast by Saône-et-Loire, south by Allier and west by Cher. Pop. (1946) 248,559. Area 2,660 sq.mi. Nièvre falls into three regions. In the east are the granitic mountains of the Morvan, one of the most picturesque parts of France, containing Mont Prénelay (2,789 ft.) and several lesser heights. The north and centre are occupied by plateaus of Jurassic limestone with a maximum elevation of 1,400 ft. The west and southwestern part of the department is a district of plains, composed mainly of Tertiary formations with alluvial deposits, and comprising the valleys of the Loire and the Allier. The lowest level of the department is 446 ft., at the exit of the Loire. Eastern Nièvre belongs to the upper basin of the Yonne, a tributary of the Seine, followed by the southern part of the Nivernais canal; western Nièvre drains toward the Loire, which crosses its southwestern corner and then forms its western boundary.

The principal cereals are oats and wheat; potatoes and various kinds of forage are also largely grown. On the extensive pastures much cattle is fattened. The Nivernais and Charolais are the chief breeds. The rearing of sheep and draught horses is also important. Vines are grown in the Loire valley and near Clamecy. The white wines of Pouilly are widely known. Nièvre abounds in forests, the chief trees being the oak, beech, hornbeam, elm and chestnut. Coal is mined at Decize, and gypsum, building stone and kaolin are quarried. The best-known mineral springs are those of Pougues and St. Honoré. Nièvre is famous for ironworks, the most important being those of Fourchambault. At Imphy there are large steelworks. The government works of La Chaussade at Guérigny make chain cables, anchors, armour plates, etc. There are also manufactories of agricultural implements and hardware, potteries, manufactories of porcelain and faïence (at Nevers) and glassworks, tileworks, chemical works, paper mills and sawmills, as well as tanneries, boot and shoe factories, cask manufactories and oil works (colza, poppy and hemp). In the Morvan district the timber industry is important.

Much of the traffic is by water; the canal along the Loire runs through the department for 38 mi., and the Nivernais canal for 78 mi. The chief railway is that of the P.L.M. company, whose main line to Nîmes follows the valley of the Loire and Allier. Nièvre is divided into 4 *arrondissements* (Nevers, Cosne, Château-Chinon and Clamecy being their capitals), 25 cantons and 313 communes. It forms the diocese of Nevers under the archbishop of Sens and part of the *académie* (educational district) of Dijon and of the region of the 8th army corps. The chief towns are Nevers, the capital, Clamecy, Fourchambault, Cosne, La Charité and Decize. The appeal court is at Bourges.

NIFO, AGOSTINO (AUGUSTINUS NIPHUS) (1473?–1538 or 1545), Italian philosopher and commentator, was born at Japoli, Calabria. He lectured at Padua, Naples, Rome and Pisa, and was deputed by Leo X to defend the Catholic doctrine of immortality against the attack of Pomponazzi and the Alexandrists. In return for this he was made count palatine, with the right to call himself by the name Medici. He edited (1495) the works of Averroes, with a commentary compatible with his lately acquired orthodoxy. In the great controversy with the Alexandrists he opposed Pomponazzi's theory that the death of the body means the death of the soul. He insisted that the individual soul, as part of absolute intellect, is indestructible, and on the death of the body is merged in the eternal unity.

His principal philosophical works are *De immortalitate animi* (1518 and 1524); *De intellectu et daemonibus; De infinitate primi motoris quaestio* and *Opuscula moralia et politica.* His numerous commentaries on Aristotle were frequently reprinted, the best-known edition being printed at Paris in 1654 in 14 vol.

NIĞDE (Arab. *Nakidah*), the chief town of a vilayet in Turkey, situated on the Kaisarieh-Cilician Gates road. It is remarkable for the beauty of its buildings, dating from almost all ages of the Seljuk period. After the fall of the sultanate of Rum (of which it had been one of the principal cities), Niğde became independent, and, according to Ibu Batuta, ruinous, and did not pass into Ottoman hands till the time of Mohammed II. It represents no classical town, but, with Bor, has inherited the importance of Tyana, whose site lies about 10 mi. S.W. A Hittite-inscribed monument, brought perhaps from Tyana, has been found at Niğde. Pop. (1950) 12,423; of the vilayet, 331,061.

NIGEL (d. 1169), bishop of Ely, head of the exchequer in the reigns of Henry I. and Henry II., was brought into the exchequer in early life (1130). Soon after his uncle Roger of Salisbury secured him the bishopric of Ely, much to the disgust of the monks. Nigel incurred the suspicion of leaning towards the Angevin interest, when Roger of Salisbury and Alexander of Lincoln were arrested by Stephen (Jan. 1139). He attempted to maintain himself in his see by force of arms, but he was forced to fly to the empress at Gloucester. He was reconciled to Stephen in 1142 and restored to his see; but he now quarrelled with Henry of Winchester and was forced to go to Rome. Fortunately, he secured the strong and uniform support of the Roman Curia. At the accession of Henry II. (1154) Nigel was summoned to reorganize the exchequer. He was the only surviving minister of Henry I., and his knowledge of the exchequer business was unrivalled. This was the great work of his life. To the work of his son Richard, the *Dialogus de Scaccario*, we owe our knowledge of exchequer procedure as it was left by Nigel. The bishop took little part in politics, except as an administrator. In 1166 his health was broken by a paralytic seizure.

See F. Liebermann, *Einleitung in den Dialogus de Scaccario* (1875); J. H. Round, *Geoffrey de Mandeville* (1892).

NIGER, a great river of West Africa, inferior only to the Congo and Nile among the rivers of the continent. Rising within 150 m. of the sea in the mountainous zone which marks the north-east frontiers of Sierra Leone and French Guinea, it traverses the interior plateaux in a vast curve, flowing north-east, east and south-east, until it finally enters the Gulf of Guinea through an immense delta. Its total length is about 2,600 miles. About 250 m. from its mouth it is joined by the Benue, coming from the east from the mountainous region of Adamawa. From its mouth to the limit of navigability from the sea the Niger is in British territory; above that point it flows through French territory. The area of the Niger basin is calculated at 580,000 sq.m. at least.

The source of the Niger lies in 9° 5′ N. and 10° 47′ W.; the most northerly point of the great bend is about 17° N. and the mouth is in 4° 30′ N. 6° E. The river is known locally under various names, the most common being Joliba (a Mandigo word meaning great river) and Kworra or Quorra. By the last name the Niger was known in its lower reaches before its identity with the upper river was established. The Tembi, the stream considered the chief source of the Niger, issues from a deep ravine 2,800 ft. above sea-level where, from a moss-covered rock a spring issues and has made a pool below. The overflow forms the Tembi, which within a short distance is joined by two other rivulets, the Tamincono and Falico, which have their origin in the same mountainous district. After flowing north for about 100 m., the river turns eastward and at its confluence with the Tankisso (a northern tributary), 210 m. from its source, has attained dimensions sufficient to earn for itself the title Joliba. Taking at this point a decided trend northward, the Niger, 100 m. lower down, at Bamako has a depth of 6 ft. with a breadth of 1,300 feet. Seven or eight miles below Bamako the Sotuba rocks mark the end of what may be considered the upper river. Thirty miles below Sotuba are the rapids of Tulimandio; a little lower down is Kulikoro, from which point the bed of the stream for over 1,000 m. is fairly free from impediments.

Middle Niger and Lake Region.—The Niger here turns more directly to the east and increases in volume and depth. Below Sansandig the banks of the river become low, and the Niger is split up into a number of channels. Mopti is at the junction of the main stream with a large right-hand backwater or tributary, the Bani or Mahel Balevel, on which is situated the important town of Jenné. Below Mopti is a swampy and treeless region and the first of a series of lakes (Debo) is reached. These lakes are chiefly on the left of the main stream, with which they are connected by channels conveying the water in one direction or the other according to the season. At high water most of these are united into one general inundation. The largest lake, Faguibini, is nearly 70 m. long by 12 m. broad, has high shores and reaches a depth exceeding, in parts, 160 feet. It is not until Kabara, the port of Timbuktu, is reached, a distance of 450 m. from Sansandig, that the labyrinth of lakes, creeks and backwaters ceases. Below Kabara the river reaches its most northerly point. Here, and for some 500 m. down stream the river is bordered on the north by the Sahara; in places it is desert on both sides, with long lines of sand dunes. At Bamba it is shut in by steep banks, and narrows to from 600 to 700 yd., again spreading out some distance down. At Tosaye (about 250 m. from Timbuktu) the stream turns distinctly south-east and preserves that direction throughout the remainder of its course. Here, just before the bend becomes pronounced, the Baror and Chabar rocks reduce the width of the river to less than 500 ft., and at low water the strength of the current is a serious danger to navigation.

At Ansongo, 430 m. below Timbuktu, the navigable reach of the middle Niger, in all 1,057 m., ends. Four huge flint rocks bar the river at Ansongo and effectually prevent further navigation except in very shallow draught vessels. From Ansongo to Say, some 250 m., the river presents a labyrinth of rocks, islands, reefs and rapids. From Say, where the stream is about 700 yd. in breadth, to Bussa, there is another navigable stretch extending 300 miles. After the desert region is past the Niger receives the waters of the river Sokoto, a considerable stream flowing from the north-east. Some distance below this confluence are the Bussa rapids. These rapids are of a more dangerous character than any encountered between Ansongo and Say. "In one pass, some 54 yd. wide, shut in between two large reefs, a good half of the waters of the Niger flings itself over with a tremendous roar" (Hourst). The rapids extend for 50 m. or more; in a less obstructive form they continue to Rabba.

Lower River and Delta.—A little above Rabba the river makes a loop south-west, at the head of the loop being (right bank) Jebba. Here there is an island in midstream, taken advantage of in the bridging of the river by the railway from Lagos. Sixty miles lower down is the mouth of the (left hand) tributary the Kaduna, a river of some magnitude whose head waters are not far from Kano. In 7° 50′ N. 6° 45′ E. the Niger is joined by its great tributary the Benue. At their confluence the Niger is about ¾ m. broad and the Benue rather more than a mile. The united stream forms a lake-like expansion about 2 m. in width, dotted with islands and sandbanks; the peninsula at the junction is low, swampy and intersected by numerous channels. The stream, as far south as Iddah (Ida), a town on the east bank, rushes through a valley cut between the hills, the sandstone cliffs at some places rising 150 ft. high. Between Iddah and Onitsha, 80 m., the banks are lower and the country flatter, and to the south of Onitsha the whole land is laid under water during the annual floods. Here may be said to begin the great delta of the Niger, which, extending along the coast for about 120 m., and 140 or 150 m. inland, forms one of the most remarkable of all the swampy regions of Africa. The river breaks up into an intricate network of channels, dividing and subdividing, and intercrossing not only with each other but with the branches of other streams, so that it is exceedingly difficult to say where the Niger delta ends and another river system begins. The Rio Nun is a direct continuation of the line of the undivided river, and is thus the main mouth of the Niger. From the sea the only indication of a river mouth is a break in the dark green mangroves which here universally fringe the coast. The crossing of the bar—where the depth of water is but 12 or 13 ft.—requires considerable care, and as other branches of the Niger afford better access the Nun mouth is now little used. East of the

Nun the estuaries known as the Brass, Sombrero, New Calabar, Bonny, Opobo (or Imo), etc. (with the exception, perhaps, of the first-named), seem to derive most of their water from independent streams. West of the Nun all the estuaries up to the Forcados seem to be true mouths of the great river. The Forcados has supplanted the Nun river as the chief channel of communication by water with the interior. The mouth of the Forcados is 2 m. wide, the bar, formerly but ¾ m. across, had by 1927 grown to 2¼ m. across, but the depth of water allowed vessels of 18 ft. draught to enter the river; within the bar is a deep water natural harbour of 3 to 4 square miles. Five miles up stream is the port of Burutu. From the mouth of the Forcados to the main stream is 105 m., with a minimum depth in the dry season of seven feet. The other western mouths of the Niger have as a rule shallow and difficult bars. The delta is the largest in Africa and covers 14,000 square miles, a larger area than the more famous Nile delta.

The Benue.—The Benue is by far the most important of the affluents of the Niger. The name signifies in the Batta tongue "Mother of Waters." The river rises in Adamawa in about 7° 40′ N. and 13° 15′ E., at a height of over 3,000 ft., being separated by a narrow water parting from one of the head-streams of the Logone, whose waters flow to Lake Chad. In its upper course the Benue is a mountain torrent falling over 2,000 ft. in some 150 miles. With the Chad system it is connected by the Kebbi or Mayo Kebbi, a river which issues from the south-west end of the Tuburi marshes, and eventually joins the Benue. The Tuburi marshes occupy an extensive depression in the plateau east of the Mandara hills, and are cut by 10° N., 15° E. The central part of the marshes forms a deep lake, whence there is a channel going northward to the Logone.

Below the Kebbi confluence the Benue, now a considerable river, turns from a northerly to a westerly direction and is navigable all the year round by boats drawing not more than 2½ feet. At Yola, a town some 850 m. by river from the sea and at an altitude of 600 ft., the width of the stream at flood time reaches to 1,000 or 1,500 yd., and though it narrows at the somewhat dangerous rapids of Runde Gilla to 150 or 180 yd., it soon expands again. About 50 m. above Yola the Benue is joined by the Faro, a river rising in the Adamawa hills, and some 50 m. below Yola the Benue receives, on the right bank, the Gongola, which rises in the Bauchi highlands and after a great curve north-east turns southward. It is over 300 m. long, and at flood time is navigable for about half of its course. In its lower course the Benue is joined by several other streams; its valley is bordered by ranges of hills.

As the Niger and the Benue have different gathering grounds, they are not in flood at the same time. The upper Niger rises in June and decreases in December. The middle Niger, however, reaches its maximum near Timbuktu only in January and April–July is the low water season. The Benue reaches its greatest height in August or September, begins to fall in October, falls rapidly in November and slowly in the next three months, and reaches its lowest in March and April. The flood rises with great rapidity, and reaches 50, 60 or even 75 ft. above the low-water mark.

Below the Benue confluence the Niger is at its lowest in April and May; in June it is subject to great fluctuations; about the middle of August it usually begins to rise; and its maximum is reached in September. In October it sinks, often rapidly. A slight rise in January, known as the *yangbe,* is occasioned by water from the upper Niger. Between high and low-water mark the difference is as much as 35 ft.

History and Exploration.—Vague ideas of the existence of the river were possessed by the ancients. The great river flowing eastward reached by the Nasamonians as reported by Herodotus can be no other than the Niger. Pliny mentions a river Nigris, of the same nature with the Nile, separating Africa and Ethiopia, and forming the boundary of Gaetulia; and it is not improbable that this is the modern Niger. In Ptolemy, too, appears along with Gir (possibly the Shari) a certain Nigir (Νίγειρ) as one of the largest rivers of the interior; but so vague is his description that it is impossible definitely to identify it with the Niger. Arabian geographers, such as Ibn Batuta, who were acquainted with the middle course of the river, called it the Nile of the Negroes. At the same time contradictory opinions were held as to the course of the stream. It was supposed by some geographers to run west, an opinion probably first stated by Idrisi in the 12th century. Idrisi gave the Nile of Egypt and the Nile of the Negroes a common source in the Mountain of the Moon. Fountains from the mountain formed two lakes, whence issued streams which united in a very large lake. From this third lake issued two rivers—the Nile of Egypt flowing north, and that of the Negroes flowing west (*see* R. Dozy and M. J. de Goeje's *Edrisi,* Leiden, 1866: Premier Climat, 1st four sections). From Idrisi's description it would appear that he regarded the Shari, Lake Chad, the Benue, Niger and Senegal as one great river which emptied into the Atlantic. From 1405 to 1413 a Frenchman, Anselme d'Isalguier, lived at Gao, a city on the Niger 400 m. below Timbuktu; the account of his travels was never printed and is lost. Knowledge of his adventures, never widely known, was completely forgotten until brought to light by Ch. de la Roncière (*see* his *Découverte de l'Afrique au Moyen Âge,* vol. iii., Cairo, 1927). Leo Africanus visited the Niger regions in 1513–15 without settling the question as to the direction of the river. The belief that a western branch of the Nile emptied itself into the Atlantic was held by Prince Henry of Portugal, who instructed the navigators he despatched to Guinea to look for the mouth of the river, and when in 1445 they entered the estuary of the Senegal, the Portuguese were convinced that they had discovered the Nile of the Negroes (*see* Azurara's *Discovery and Conquest of Guinea,* Beazley and Prestage's translation, vol. ii., London, 1899, chap. lx. and lxi., and introduction and notes). The Senegal being proved an independent river and the eastward flow of the Niger assumed, the theory that it ran into the Nile was revived.

That the vast network of rivers on the Guinea coast, of which the Nun was the chief, known as the Oil rivers, formed the delta of the Niger does not appear to have been suspected before the beginning of the 19th century. Consequently it was from the direction of its source that the river was first explored in modern times. In 1795 Mungo Park (*q.v.*), sent out by the African Association, landed at the Gambia, and struck the Niger near Segu on July 20, 1796, where he beheld it "glittering in the morning sun as broad as the Thames at Westminster and flowing slowly to the eastward" (*Travels,* 1st ed., p. 194). He descended the river some distance, and on his return journey went up stream as far as Bamako. In 1805 Park returned to Africa for the purpose of descending the Niger to its mouth. From Bamako he sailed down the river for over 2,000 miles and on the eve of the successful accomplishment of his undertaking lost his life during an attack on his boat by the natives at Bussa (Nov. or Dec. 1805). Park held to the opinion that the Niger and Congo were one river, though in 1802 C. G. Reichard, a German geographer, had suggested that the Rio Nun was the mouth of the Niger. Owing to Park's death the results of his second journey were lost, and the work had to be begun afresh. In 1822 Maj. A. G. Laing (who had reached Timbuktu by way of Tripoli) obtained some accurate information concerning the sources of the river, and in 1828 the French explorer René Caillié went by boat from Jenné to the port of Timbuktu. In 1826 Bussa was reached from Benin by Hugh Clapperton, and his servant Richard Lander. On Clapperton's death Richard Lander and his brother John led in 1830 an expedition which went overland from Badagry to the Niger. Canoeing down the river from Yauri—60 m. above Bussa—to the mouth of the Rio Nun they finally settled the doubt as to the lower course of the stream.

Heinrich Barth (1851–54) made known to Europe the course of the river from Timbuktu to Say. Later, the extension of French influence throughout the western Sudan led to an accurate knowledge of the river above Timbuktu. From 1880 onwards Col. (afterward General) Gallieni took a leading part in the operations on the upper river, where in 1883 a small gunboat, the "Niger," was launched for the protection of the newly

established French posts. In 1885 a voyage was made by Capt. Delanneau past the ruins of Sansandig, as far as Diafarabe. In 1887 the "Niger" made a more extended voyage, reaching the port of Timbuktu. A more important expedition was that of Lieut. Hourst, who, starting from Timbuktu in Jan. 1896, navigated the Niger from that point to its mouth.

In addition to the main stream, the Niger basin was made known during the last quarter of the 19th century and the early years of the 20th. The journeys of the German traveller G. A. Krause (north from the Gold Coast, 1886–87) and the French Capt. Binger (Senegal to Ivory Coast, 1887–89) first defined its southern limits by revealing the unexpected northward extension of the basins of the Guinea coast streams, especially the Volta and Komoe, a fact which explained the absence of important tributaries within the Niger bend. The exploration of the Benue dates from the middle of the 19th century. In 1851 Barth crossed the Benue at its junction with the Faro, but the region of its sources was first explored by the German E. R. Flegel (1882–84), who traversed the whole southern basin of the river and reached Ngaundere. The Benue itself had been ascended 400 mi. by the "Pleiad" expedition in 1854 and in 1889 the river was traced to 13½° E., and Kebbi to Bifara by Maj. (afterward Sir Claude) Macdonald, further progress toward the Tuburi marsh being prevented by the shallowness of the water. In 1903, a French officer, Capt. E. Lenfant (who had in 1901 succeeded in navigating the Bussa rapids on the Niger) ascended the Kebbi and discovered the Lata fall, continuing up the river to its point of issue from Tuburi. Crossing the marshes he found and navigated the narrow river leading to the Logone.

From Kulikoro (which is connected by railway with the port of Dakar) downward, the French have undertaken works on the Niger with a view to deepening the channel, and they maintain a regular steamer service to the port of Timbuktu. In 1910 the British began dredging with the object of obtaining in the lower river a minimum depth of 6 ft. of water; however, while there is still a large river traffic the building of railways in Nigeria has deprived the lower Niger and the Benue of their importance as highways of commerce to the far interior.

NIGERIA, a British colony and protectorate in West Africa, occupying the basin of the lower Niger and adjacent regions. Area 338,593 sq.mi.; pop. (1931 census) 19,928,171. Administratively attached to Nigeria is that part of the Cameroons under British mandate, which has an area of some 34,081 sq.mi. and a population of (1939 est.) 868,637. Nigeria is bounded south by the Gulf of Guinea; west by Dahomey; north by the French Niger Colony; and east by the French sphere of the Cameroons. It includes the former British colony and protectorate of Lagos (*q.v.*), and is nearly seven times the size of England. The following particulars do not include the British sphere of the Cameroons (*q.v.*).

Physical Features.—Nigeria is divisible, broadly, into zones parallel with the coast: (1) the delta, (2) forest region, (3) a zone of comparatively open country giving place to (4) the plateau region. The coast-line, some 500 m. in length, extends along the Gulf of Guinea from 2° 46′ 55″ E. to 8° 45′ E., ending at the Rio del Rey, where the great bend eastwards of the continent ceases and the land turns south. The Niger (*q.v.*), which enters the country at its north-west corner and flows thence south-east to the Atlantic, receives, 250 m. from the sea, the Benue, which, rising in the mountains of Adamawa south of Lake Chad, flows west across the plateau. Into the huge delta of the Niger several other rivers (the "Oil Rivers") empty themselves; the chief being, on the west, the Benin (*q.v.*), and, on the east, the Brass. East of the Niger delta is that formed by the Imo or Opobo, Bonny and other streams, and still farther east is the Calabar estuary, mainly formed by the Cross river (*q.v.*).

The delta region is swampy, and forms, for a distance of from 20 to 60 m. inland, a network of interlacing creeks and broad sluggish channels fringed with monotonous mangrove forests. Beyond the delta firm ground takes the place of mud and the mangroves disappear. The land rises gradually at first, becoming, however, in many districts very hilly, with heights of 3,000 ft., and is covered with dense evergreen or rain forests which give place to deciduous forest as the rainfall decreases. The evergreen and deciduous forests form part of the great West African forest belt; the trees are straight, tall and cylindrical and there is little undergrowth, though often bound together by creepers. The forest belt extends 50 to 100 m. and is succeeded by park-like land, the savannah and orchard forests much more extensive than the dense forest, with strips of deciduous forest going through it along the river banks.

North of the Niger-Benue confluence, which is but 250 ft. above sea-level, are hills forming the walls of the plateau which extends over the major part of the country and is part of the great plateau of North Africa. This plateau, broken only by the valleys of the rivers, does not attain an elevation approaching that of the plateaux of South Africa, the culminating point (apart from particular mountain districts), situated in about 10° N., reaching a height of 3,000 ft. only. The valleys of the Niger and Benue, especially the latter, are much lower, the town of Yola on the Benue, some 400 m. inland, lying at an altitude of little over 600 feet. The surface is generally undulating, with isolated "table mountains" of granite and sandstone often rising abruptly from the plain. It is clothed largely with thin forest, but becomes more open to the north until, towards the French frontier, the arid steppes bordering the Sahara are reached. Much of the country north of Zaria (11° N.) is covered with heavy, loose sand. The most mountainous districts are northern Bauchi (a little N. of 10°), where there are heights rather above 4,000 ft.; parts of Muri, along the north bank of the Benue; and the southern border of the Benue basin, where the hills consist of ironstone, quartz and granite. On the east the plateau sinks to the plains of Bornu (*q.v.*), which extend to Lake Chad. Tributaries of the Niger traverse the western portion of the country, the most noteworthy being the Gublin Kebbi, or Sokoto, river and the Kaduna, which flows through a valley not more than 500 ft. above the sea. The north-eastern part of the country drains to Lake Chad by the Waube or Yo, an intermittent stream, which in its lower course forms the Anglo-French boundary. The western portions of Lake Chad (*q.v.*) belong to the protectorate, which contains no other large lake. The water parting between the Chad and Niger systems runs north-west and south-east from about Katsina in 13° N. to the Bauchi hills.

Geology.—Except in the coast belt, which is composed of superficial deposits, crystalline rocks are the fundamental formation. From the edge of the coast belt to near the Niger-Benue confluence, these rocks are overlain by unfossiliferous sandstones, lying undisturbed, and possibly of the age of the sandstone of the

Congo basin. Much of the plateau—with its flat-topped hills and red earths—consists of what is called the fluvio-volcanic series. The alluvial deposits here are often unconnected with the present drainage lines. On the Bauchi plateau are large deposits of cassiterite (tin) mostly found in the detrital deposits resulting from the great denudation over the plateau. Limestones, with fossils indicating a Tertiary age, have been found near Sokoto. Recent alluvium and a thick deposit of black earth border the upper reaches of the Benue and cover wide areas around Lake Chad. Coal measures are found in the Enugu district east of the Niger and south of the Benue, and in the Bende district near the Cross river; there are large deposits of lignite in the younger Tertiary group in the Niger valley and in the neighbourhood of the Benue, where they are interstratified with white clays; rock phosphates are found north of Lagos and there is a belt of auriferous country north of Minna (towards the Kaduna river).

Climate.—Though Nigeria lies wholly within the tropics, there is a distinct difference in the climate of the northern and southern regions. In the south the climate is typical of the tropics; in northern Nigeria it resembles that of Egypt and may be described as sub-tropical. In the south the temperature varies comparatively little, from 70° to 100° F, and averages over 80° F. The air is both hot and humid; the rainy season is sometimes prolonged to ten months or more, the rainfall in the delta being from 100 to 140 or more inches a year. (At Bonny in 1923 the fall was 150·59 in., rain occurring on 151 days.) The prevailing wet season wind is from the south-west. From November to March the *harmattan*, a dry, dust-laden north-east wind, coming from the Sahara, blows intermittently, and this is the dry season, when at Lagos humidity has been known to fall to 26% against a mean of 90%. At Lagos the usual rainfall is 77 in. a year. Tornados occur at the beginning and end of the *harmattan*. Malaria is still a scourge in these southern districts and the country is unhealthy for Europeans. In the north the temperature is still high, but for nine months of the year the air is dry, "the dry air of the desert, the intense parching dryness of which is almost inconceivable by anyone who has not experienced it" (O. T. Faulkner, director of agriculture, Nigeria). July–September are the rainy months in the north, the fall being usually 25 to 30 in. a year, though in places it is as much as 60 inches. The *harmattan* begins in the north in October and lasts till April. In this season variations in temperature are great. At Hadeija, in 1922, a minimum of 35° F and a maximum of 115° F were recorded. In some parts of the plateau Europeans can live in comparative comfort, the climate resembling that of an unusually fine English summer, often with cool nights. Between the southern and northern regions there is an intermediate zone with a normal rainfall of from 40 to 50 in. a year and still considerable humidity.

Fauna and Flora.—There are many large and small mammals. They include the elephant, lion, leopard, giraffe, West-African buffalo, many kinds of antelope and gazelle and smaller game. The chimpanzee, the drill ape, the baboon and many kinds of monkeys are found in the forests and snakes are common. They are many varieties of squirrel, some finely coloured. The camel is found in the northern regions. In the rivers are rhinoceros, hippopotamus and crocodile. The manatus is also found. The birds include the ostrich, marabout, vultures, kites, hawks, ground hornbill, great bustard, guinea fowl, partridge, lesser bustard, quail, snipe, duck widgeon, teal, geese of various kinds, paraquets, doves, blue, bronze and green pigeons and many others. Domestic animals include the horse and donkey in the plateaux, but baggage animals are rare in the coast-lands, where the tsetse fly is found. Mosquitoes are abundant throughout the delta. There are the remarkable hammer-headed fruit-bat and other varieties of bats and a curious kind of dormouse. Many species of butterfly and spiders are recorded.

The mangrove is the characteristic tree of the swamps. North of the swamps the oil palm (*Elaeis guineensis*) flourishes abundantly. It is common as far as about 7° N. The evergreen and deciduous forests contain a great wealth of timber. Among the trees are mahogany, cedars and scented cedars, walnut, rosewood, satinwood, ebony, African teak and other valuable species. There are also African maple, shingle-wood, cork-wood, cotton-wood and other general utility woods, including the *abura* whose timber is acid resisting. Rubber vines are also found in these forests. Other trees found, chiefly on the plateaux, are the baobab, the shea-butter tree, the locust tree, gambier, palms, including the date and dum palm (Hyphaene), the tamarind, and, in the arid regions, the acacia and mimosa.

Inhabitants.—The vast majority of the inhabitants are typical negroes. In the south-west the Yorubas (*q.v.*) are the chief race. They occupy the country behind the coast-lands, from Dahomey to Benin, and have a considerable degree of civilization. In the delta district and the forest zone, besides the people of Benin, are the Jekri, living on the lower part of the Benin river and akin to the Yorubas, the Ijos, living in the delta east of the main mouth of the Niger, and the Ibos, occupying a wide tract of country just above the delta and extending east from the Niger to the Cross river. South of the Ibos live the Aros, a tribe of relatively great intelligence, who dominated many of the surrounding tribes and possessed an oracle or *ju-ju* of reputed great power. On the middle Cross river live the Akuna-kunas, an agricultural race, and in the Calabar region are the Efiks, Ibibios and Kwas. All these tribes are fetish worshippers, though Christian and Muslim missionaries have made numerous converts. The Efiks, a coast tribe which early came into contact with white men, have adopted several European customs, and educated Efiks are employed in Government service. The great secret society called Egbo is an Efik institution.

In the northern parts of Nigeria the inhabitants are of more mixed blood, owing to the invasion of Fula, Berber and Arab or Arabized people. But the bulk of the people are negroes. The most important of these negro peoples are the Hausa (*q.v.*), among whom the superior classes adopted Mohammedanism in the 13th and 14th centuries. The Hausa are keen traders and make excellent soldiers. The Fula tribe, besides providing the ruling families in many of the Hausa States, form a separate caste of cattle-rearers. Arab merchants live in some of the larger Hausa towns.

In general, the people living in the river valleys have been little or not at all affected by Muslim propaganda, either in blood or religion. Thus along the banks of the Niger, Benue and other streams, the inhabitants are negro and pagans, and generally of a primitive though often rather fine type. Of these the Munshi, who inhabit the district nearest the junction of the Benue with the Niger, were long noted for their intractability and hostility to strangers, whom they attacked with poisoned arrows. The Yorag-

FROM E. D. MOREL, "NIGERIA"

A GROUP OF HAUSAS CARRYING THE SHORT-HANDLED HOES IN THE ANCIENT HOE DANCE

hums, their neighbours, were cannibals. Nearer Yola live the Battas, who also had a bad reputation. In the central hilly region of Kachia are other pagan tribes. When first met by Europeans they wore no clothes, and their bodies are covered with hair. South of the Benue, near the Niger confluence, dwell the Okpotos, Bassas and other tribes, which had a reputation for savagery and war-lust. In the districts of Illorin and Borgu, west of the Niger, the inhabitants are also negroes and pagan, but of a more advanced type than the tribes of the river valleys. According to some native traditions, the people of Borgu claim to have a Coptic

origin. In Bornu (*q.v.*) the population consists of (1) Berberi or Kanuri, the ruling race, containing a mixture of Berber and negro blood, with many lesser indigenous tribes; (2) so-called Arabs, and (3) Fula.

A complete list of the tribes in Nigeria would run into many scores, and each has its separate language. In the old province of Bauchi alone as many as 60 different languages are spoken. The most widely diffused languages are Hausa and Yoruba. Arabic is the court and official language in the Fula emirates. In the ports many natives speak English.

The European inhabitants number (1929) some 5,000. They are chiefly officials, traders and missionaries. On the tin-fields are some 700 whites including over 100 women.

Chief Towns.—A large proportion of the people are town-dwellers. The ports, with the exception of Lagos, are all on the rivers. From west to east the ports reached by ocean steamers are Lagos (*q.v.*), the capital of Nigeria; Forcados, at the mouth of the Forcados branch of the Niger and the main port of entry for the river, having 18 ft. of water over the bar; Burutu, 5 m. above Forcados and the port of the Niger Co.; Warri 30 m. above Forcados; Koko and Sapele, on the Benin river, but reached by way of Forcados. All these ports are west of the Nun mouth of the Niger, where on the west bank is Akassa (14 ft. of water). East of the Nun mouth are Brass town (on the Brass river) and Bonny, at the mouth of the Bonny river. The three last-named ports, once flourishing, are now little used. Some 40 m. up the Bonny river is Port Harcourt (*q.v.*), second in importance of the ports of Nigeria. Farther east are Opobo (13 ft. of water), on the Imo river, richest of the oil-rivers of Nigeria, Degema (18 ft.), and Calabar (*q.v.*). On the river Niger, at the head of the delta, are Asaba (west bank) and Onitsha (east bank); farther north is Idah (east bank) in the palm-oil zone; Lokoja (*q.v.*) is at the Niger-Benue confluence; Baro, 70 m. above Lokoja, is on the railway system; and still farther north, on the river, are Egga, Jebba and Bassa (*q.v.*).

The largest cities are found in Yorubaland. Of these Ibadan (pop., 1953, 416,174), the largest native city in Africa, Ilorin and Abeokuta are separately noticed. Other Yoruba cities are Ogbomosho (pop. 86,744), Oshogbo (pop. 49,599), Iwo (57,191), Ede (52,392) and Ogo (48,733). Other towns in the south are Benin (*q.v.*), west of the Niger and Bende, and Enugu, east of the river. Enugu (pop. 40,878) is the centre of the Udi coalfield.

In northern Nigeria, where the larger towns have generally a population of from 40,000 to 50,000, the chief city is Kano (*q.v.*), the commercial capital, situated in 12° N., 8° 32′ E. Sokoto, the religious and political centre of the Fula, is some 220 m. W.N.W. of Kano. Katsina (*q.v.*), near the frontier and 84 m. N.W. of Kano, has a reputation as an educational centre; other chief Hausa towns are Zaria (*q.v.*), Bauchi (or Yakoba); Beda; and Yola (*q.v.*) The chief towns of Bornu are Kukawa or Kuka (*q.v.*), near Lake Chad, Maidugari and Dikwa (Dikoa). The administrative capital of northern Nigeria is Kaduna; Jos, a modern town with European amenities, is the centre for the Bauchi tin-fields.

Communications.—Railways are now the chief means of transport, the shallowness of the Niger and Benue for a large part of the year rendering them an uncertain means of communication. There is still, however, a considerable river traffic, and in the delta the rivers remain the great highways. There is a regular steamer service between Forcados and Lagos, and between Lagos and Dahomey by the lagoons. From Forcados two steamers ascend the main Niger to Jebba, a distance of 530 miles. On the Benue there is steamer traffic as far as Yola. But between May and October navigation is only possible to vessels drawing not more than 3 ft. of water. There are navigable stretches of several other rivers—the Cross river can be ascended for 240 miles. For the main part the river services are (except in the delta) auxiliary to the railways.

Railway building began in 1896, with a line from Lagos to Ibadan, a distance by rail of 123 miles. This line was finished in 1900. In 1906 a forward policy was adopted, and since then progress has been rapid. The railways have been built and are owned and worked by the Nigerian Government and are of the standard African 3 ft. 6 in. gauge, unless otherwise stated. In 1929 some 1,900 m. of railway were open, the system consisting of:—(1) A western line running from Lagos to Kano (705 m.), via Abeokuta, Ibadan, Ilorin, Kaduna and Zaria. The Niger is crossed at Jebba—where there is an island—by two bridges, together 1,795 ft. long. The bridges, the last part of the line to be built, were completed in 1914. A branch line (111 m.) runs from Minna to Baro, on the Niger. Another branch line runs from Zaria, by Guasu to Kaura Namoda (142 m.), and in 1928–29 the main line was extended from Kano to Hadejia (102 miles). (2) An eastern line (built 1913–26) from Port Harcourt to Enegu, for the Udi coalfields, and Kaduna (569 m.), where it joins the western railway. The Benue is crossed at Makurdi, pending the completion of a bridge, by train ferry. A short branch line running to Jos, for the tin-fields, was opened in April 1927, and since then all the tin is sent to Port Harcourt. Jos was formerly served by a light line (2 ft. 6 in. gauge) from Zaria, on the western railway. This light line now carries cotton. In 1928 the building of a trunk railway to Lake Chad, at an estimated cost of some £5,000,000, was sanctioned. The capital cost of the railways, up to March 1928, had been £18,104,000 of which sum £15,245,000 had been raised by loan on the London market, at an average rate of interest under 5%. The railways are worked as a business concern, but the ultimate profits go to the colonial treasury. Motor traffic has to a large extent superseded other methods of road travel. Some 3,000 m. of all-the-year-round motor roads were being maintained in 1928 by the Public Works Department alone. There are, additionally, many miles of dry-season motor roads in the north.

There is regular steamship communication by several lines between Europe and Lagos and other Nigerian ports; direct cable communication with Europe and South Africa, an extensive system of inland telegraphs, and a wireless station at Lagos. The principal passenger and mail service is by the Elder Dempster line from Liverpool to Lagos, the voyage taking 15 days. A regular service between British ports and Nigeria has been maintained since 1852.

Administration.—The country is divided into three parts; the colony of Nigeria (the old Lagos colony) with an area of 1,400 sq.m. only; and the northern and southern provinces (78,600 sq.m. and 255,700 sq.m. respectively) which form the Protectorate of Nigeria. At the head of the administration is a governor; there is a lieut.-governor for the northern and for the southern provinces, and, since Oct. 1927, a separate administrator for the colony. Certain important services, *e.g.*, the railways, function throughout Nigeria. The governor, whose headquarters are in Lagos, is aided by an executive council of officials, and for the colony and the southern provinces there is a legislative council on which, since 1923, elected members have sat to represent the towns of Lagos and Calabar. (The franchise is conferred on adult males with an income of £100 a year or more.) On the council are also members nominated by various commercial bodies and others nominated to represent African interests. The legislative council is given control of expenditure in the northern provinces derived from the revenues of the central Government. The number of provinces has varied from time to time. As far as possible the system of indirect rule is observed; that is, the native governments existing before the British occupation are retained, each with its own treasury and judiciary, the rulers being guided by the advice of a British resident, under whom are district officers. This indirect rule prevails in almost all the northern provinces and also in Yorubaland. In these native states direct taxation and a fixed income for the emirs and other paramount chiefs has led to the abolition of many abuses. Fifty to 70% of the direct tax goes to the native treasuries.

Education and health are departments of primary value. There are Government elementary and technical schools, and King's college, Lagos, founded 1909, provides secondary education. At Katsina is a training college for native teachers, opened 1922, and there are training colleges in southern Nigeria, including two for women teachers. Education remained, however, chiefly in the hands of Christian missions; the Hope Waddell institute at Calabar, a Scottish missionary enterprise, has a high reputation for

industrial training. Both the missions and State schools now pay special attention to practical agricultural training. Some of the native administrations have their own schools. The Yoruba have for long shown an eagerness for education; after the World War the demand for education among the natives generally greatly increased. The health department has done a great and successful work in fighting malaria, dysentery, yellow fever and plague, and in insisting upon better housing and better food for Europeans. As one result the death rates of whites fell between 1903 and 1926 from over 20 per 1,000 to under 9 per 1,000.

Before amalgamation the administration of northern Nigeria required grants-in-aid to meet expenses, which were partly furnished by her richer neighbour, southern Nigeria. Since amalgamation, Nigeria has been self-supporting, though revenue in some years falls short of expenditure. In 1914 revenue was £3,048,000 and expenditure £2,967,000; in 1923–24 revenue had risen to £6,260,000 and expenditure to £5,501,000. The figures for 1926–27 were, revenue £7,734,000, expenditure £7,584,000. Revenue is derived from customs duties on imports fixed at 15% *ad valorem* in 1922; on the chief exports (this duty was first imposed in 1916); by direct taxation; and, in the colony only, and since 1927, income tax. It may be noted that a special West African currency is in circulation and that for purposes of trade between natives it has been necessary to mint a coin valued at one-tenth of a penny. The Bank of British West Africa and the Colonial Bank have agencies in the chief towns. British weights and measures are in use.

Economic Conditions.—There is a very large internal trade, as to which no statistics are available, but it is believed to exceed in value the external trade. The great majority of the people are agriculturists, including, in the north, cattle-rearing. Native manufactures are of minor importance—they include in the Hausa States the making of "Morocco" leather; mining (tin and coal) owes its development to the British. Fishing is largely followed in the delta. In a broad generalization the products of southern Nigeria are sylvan, palm oil and palm kernels taking the leading place. Cocoa and cotton are other products. From the middle belt come benniseed and shea-butter—both adding to the oil output. From northern Nigeria come groundnuts (a basis for margarine), hides and skins, cattle, and, in increasing quantities, cotton. (Cotton and maize are the only crops common to the northern and southern provinces.) Add to the products named coal and tin and timber, and the leading exports have been stated.

The coast peoples, since the 15th century, had traded directly with the European merchants who came to their ports, but the dense forest belt cut off intercourse with the interior—though the Niger and Benue might have afforded means of penetration. But up to the middle of the 19th century the trade of Hausaland and Bornu (that is northern Nigeria) was either with the Mediterranean by caravan across the Sahara, or east and west to other parts of the Sudan. Direct, but, at first, very limited, trade with the interior followed the efforts of the British government and merchants to open up the country by sending expeditions up the Niger and Benue. Modern developments date from the founding of the Royal Niger company by Sir George Goldie and the conquest of the Fula emirates by Sir F. D. (Lord) Lugard. (*See* p. 442, *History.*) The trade of Lagos and the oil rivers, the last the eastern part of southern Nigeria, partly through having been long established, was, up to 1928 at least, more valuable than that of northern Nigeria, which contains large areas sparsely peopled and little cultivated, and was not fully opened to trade with the south until the beginning of the 20th century. (This trade via the Gulf of Guinea, together with minor causes, almost killed the trade via the Sahara.) In 1901 when the total external trade of the southern regions was valued at over £4,000,000 that of northern Nigeria was probably (statistics are lacking) not £250,000. With the completion of the railway to Kano in 1911, there was a great increase in trade in the north. Since the amalgamation of southern Nigeria (including Lagos) with northern Nigeria in 1914 statistics are given for the country as a unit. In that year the imports were valued at £6,276,000 and the exports at £6,420,000. In 1924, when normal conditions following the World War were considered to be restored, the figures were:—imports £10,948,000; exports £14,460,000. In 1927 the external trade was nearly £30,000,000—imports being £14,146,000 and exports £15,654,000. These figures exclude specie.

Almost all sylvan and agricultural work in Nigeria is done by native owners, peasant farmers with small holdings, usually about 3 acres. The main concern of the farmer is to produce food crops—guinea corn and millet, yams and bananas, and maize—for himself and his family; he works for sale only in his spare time and to get luxuries. The great occupation in the delta is the production of palm oil and palm kernels. The yearly export is about 100,000 tons of oil and double that weight of kernels. Native methods of treating the fruit waste about half of the oil; up to 1928 only one factory had been started to deal with the fruit. Cocoa plantations were started in south Nigeria about 1905; the production of cocoa grew by 1928 to 40,000 tons in the year. Cotton growing for export dates from the early years of the 20th century; in 1912 an American variety of cotton was introduced and found suitable. In the centre and south a native cotton is also grown for export. By 1925 the export had reached 35,000 bales; two or three poor seasons followed; the 1925 output was nearly reached again in 1928, and the acreage under cotton increased. Many ginneries have been set up. The cultivation of groundnuts in northern Nigeria—climate and soil are well suited to the crop—grew rapidly with increased transport facilities. In the year 1927–28 (April and March inclusive) the railways carried 96,000 tons of nuts as against 4,800 tons of cotton. Generally, farming in Nigeria is not on a high level, partly because fertilizers are not used. The exhaustion of much land within easy reach of transport caused grave concern to the Government which from 1926 onward took measures to instruct the farmers in the use of manures and other fertilizers. There are, however, good stock farms in the north with large herds of cattle and flocks of sheep and goats.

The chief industries which are owned by Europeans are the tin and coal mines. The ascertainment of the richness of the tin-fields in Bauchi in 1902 led to a speedy development of the mines (which employ 30,000 to 35,000 natives), and the output of coal from Ude, which began in 1915, is of much importance. The coal mines are worked by the railway department for the Government; they supply the fuel for the tin mines, for their own railway and for the Gold Coast railways, and still have a surplus for the Government marine and the shipping companies. The output for the year ended March 31, 1928, was 345,000 tons. The tin-fields (*see* BAUCHI) are worked by private enterprises, mostly for companies registered in London. The timber-cutting concessions are also in the hands of Europeans. There are 200,000 sq.m. of forest in Nigeria; the timber exported is mainly mahogany, cedar and walnut, the mahogany chiefly from the Benin forests. Gum arabic is obtained from Bornu and other northern provinces. "Wild" rubber is still tapped, and plantation rubber is exported. The relative value of the chief exports is shown in the following figures for 1927:—Palm oil, £3,617,000; palm kernels, £4,574,000; groundnuts £1,633,000 (£2,342,000 in 1926); cocoa, £1,968,000; cotton lint, £611,000 (£1,182,000 in 1926); tin, £2,403,000.

The imports are of a most miscellaneous character; they may be classed under the main heads of cigarettes, cotton goods (both from the United Kingdom), provisions, hardware, salt, kola nuts (from the Gold Coast), petrol, and alcoholic liquors (mostly gin from Holland). (Though the import of "trade spirits" has been prohibited since 1919, and no alcoholic liquors, save for Europeans, are allowed into northern Nigeria, the growing wealth of the natives of southern Nigeria led to an increased demand for ordinary spirits and beer.) With regard to the direction of trade the figures for 1927 showed that 53·5% was done with the United Kingdom—which supplied 62% of the imports and took 45·6% of the exports. In that year Germany had 15% and the United States 10% of the total trade. Of the exports the palm kernels—largely used as cattle food—go to Germany and England, and the groundnuts to Germany, 60%, and France. The United States supplies kerosene, petrol and unmanufactured tobacco, and takes about 25% of the palm oil, and 30% of the cocoa.

Defence.—With a population approaching 19,000,000, order is maintained in Nigeria, and defence provided for the colony, by the Nigeria regiment of the West African frontier force (*see* Great Britain: *Colonial Forces*). This force, which was raised in 1901, consists of officers and non-commissioned officers of the British Army and other ranks recruited locally for 6 years with the colours and 3 in the reserve, with facilities for re-engagement. Training is on the lines of the British army. Regimental transport is by native carriers; transport animals are not used. The Nigeria regiment includes 1 battery of artillery (3·7 inch howitzers), 4 battalions of infantry, 1 light mortar unit, a signal school, and a depot. The establishment is 3,599, with a reserve of 682. There are also armed police with an establishment of 1,260 in the northern provinces, 2,105 in the southern. These police are liable for military service, and distributed in 7 territorial divisions, each under a senior commissioner.

HISTORY

Of the early history of the races inhabiting the coast lands little is known. The Beni appear to have been the most powerful race at the time of the discovery of the coast by the Portuguese in the 15th century, and the kings of Benin in the 17th century ruled a large part of the south-western portion of the existing British protectorate (*see* Benin). The Benin influence does not seem to have reached east of the Forcados mouth of the Niger. In the greater part of the delta region each town owned a different chief and there was no one dominant tribe. Among these people, who occupied a low position even among the degenerate coast negroes and who were constantly raided by the more virile tribes of the interior, trading stations were established by the Portuguese, and later on by other Europeans, British traders appearing as early as the 17th century. There was no assertion of political rights by the white men, who were largely at the mercy of the natives and who rarely ventured far from their ships or the "factories" established on the various rivers.

By the end of the 18th century British enterprise had almost entirely displaced that of other nations on the Niger coast. But the principal trade of all Europeans was still in slaves. After the abolition of the slave-trade in the 19th century palm oil formed the staple article of commerce, and the various streams which drain the Niger coast near the mouth of the great river became known as the "Oil rivers." The opening up of the interior was in the meantime promoted, chiefly by the efforts of British travellers and merchants. Mungo Park traced the Niger from Segu to Bussa, where he lost his life in 1805. From Bussa to the sea the course of the river was first made known in 1830 by the brothers Richard and John Lander. Maj. Dixon Denham and Capt. Hugh Clapperton entered the country now known as Northern Nigeria from the north in 1823, crossing the desert from Tripoli. Clapperton in 1826–27 made a second journey, approaching the same territory from the Guinea coast. Dr. Barth, travelling under the auspices of the British Government, entered the country from the north and between 1852 and 1855 made the journeys whose record still remains the principal standard work for the interior. Macgregor Laird first organized in 1832 the navigation of the River Niger from its mouth to a point above the Benue confluence. During the next 25 years expeditions were despatched into the interior and a British consul was posted at Lokoja. Possession was also taken, in 1861, of Lagos island, with the object of checking the slave traffic still being carried on in that region. But the deadly climate discouraged the first efforts of the British Government, and, after the parliamentary committee of 1865 had recommended a policy which would render possible the ultimate withdrawal of British official influence from the coast, the consulate of Lokoja was abandoned, but re-established a few years later to meet the still steadily growing requirements of British trade upon the river.

The Royal Niger Company.—In 1880 the international "scramble for Africa" led to the establishment under the recognized protection of the French Government of two French firms which opened upwards of 30 trading stations on the Lower Niger. The establishment of these firms was admittedly a political move which coincided with the extension of French influence from Senegal into the interior. Nearly at the same time a young Englishman, George Goldie-Taubman, afterwards better known as Sir George Goldie (*q.v.*), having some private interests on the Niger, conceived the idea of amalgamating all local British interests and creating a British province on the Niger. To effect this end the United African Company was formed in 1879 and trade was pushed upon the river with an energy which convinced the French firms of the futility of their less united efforts. They yielded the field and allowed themselves to be bought out by the United African Company in 1884. At the Berlin Conference held in 1884–85 the British representative was able to state that Great Britain alone possessed trading interests on the Lower Niger, and in June 1885 a British protectorate was notified over the coast lands known as the Oil rivers. Germany had in the meantime established itself in Cameroons, and the new British protectorate extended along the Gulf of Guinea from the British colony of Lagos on the west to the new German colony on the east, where the Rio del Rey marked the frontier. In the following year, 1886, the United African Company received a royal charter under the title of the Royal Niger Company. The territories which were placed by the charter under the control of the company were those immediately bordering the Lower Niger in its course from the confluence at Lokoja to the sea. On the coast they extended from the Forcados to the Nun mouth of the river. Beyond the confluence European trade had not at that time penetrated to the interior.

The interior was held by powerful Mohammedan rulers who had imposed a military domination upon the indigenous races and were not prepared to open their territories to European intercourse. To secure British political influence, and to preserve a possible field for future development, the Niger Company had negotiated treaties with some of the most important of these rulers, and the nominal extension of the company's territories was carried over the whole sphere of influence thus secured. The movements of Germany from the south-east, and of France from the west and north, were thus held in check, and by securing international agreements the mutual limits of the three European Powers concerned were definitely fixed. The principal treaties relating to the German frontiers were negotiated in 1886 and 1893; the Anglo-French treaties were more numerous; those of 1890 and 1898, which laid down the main lines of division between French and British possessions on the northern and western frontiers of Nigeria, having been supplemented by many lesser rectifications of frontier. It was not until 1909 that the whole of the frontier between Nigeria and the French and German possessions had been definitely demarcated. Thus, mainly by the action of the Royal Niger Company, and with the employment of a force of 500 Hausa trained under European officers, a territory of vast extent, into which the chartered company itself was not able to carry either administrative or trading operations, was secured for Great Britain.

The Protectorate.—Owing to pressure of foreign nations on the company's frontiers, a situation had arisen which the resources of a private company were inadequate to meet. In 1897 relations with France on the western border became so strained that Mr. Chamberlain, who was then secretary of state for the colonies, thought it necessary to raise a local force, afterwards known as the West African Frontier Force, for the special defence of the frontiers of the West African dependencies. In these circumstances it was arranged that in consideration of compensation for private rights the company should surrender its charter and transfer all political rights in the territories to the Crown. The transfer took place on Jan. 1, 1900, from which date the company, which dropped the name of "royal," became a purely trading corporation. The southern portion of the territories was amalgamated with the Niger Coast protectorate, the whole district taking the name of the Protectorate of Southern Nigeria,

while the northern portion, extending from a line drawn slightly above 7° N. to the frontier of the French possessions on the north and including the confluence of the Niger and the Benue at Lokoja, was proclaimed a protectorate under the name of Northern Nigeria.

The company, during its tenure of administrative power under the charter, had organized its territories south of the confluence into trading districts, over each of which there was placed a European agent. The executive powers in Africa were entrusted to an agent-general with 3 provincial and 12 district superintendents. There was a small judicial staff directed by a chief justice, and there was a native constabulary of about 1,000 men, trained and drilled by white officers. The company kept also upon the river a fleet of about 30 steamers. The entire direction of the proceedings of the company was, however, in the hands of the council in London, and the administrative control of the territories was practically from first to last vested in the person of Sir George Goldie. The local work of the representatives of the company was mainly commercial.

Southern Nigeria, 1885–1906.—While the development of the Royal Niger Company's territories was proceeding in the manner described, the regions under direct British control were also being opened up and law and order introduced. In 1893, when the title Oil Rivers Protectorate was changed to that of Niger Coast Protectorate, a regular administration was established (subject to the Foreign Office in London) under Sir Claude Macdonald, who was succeeded as commissioner and consul-general in 1896 by Sir Ralph Moor (1896–1904). Under these officials peace was gradually established between various tribes, trade routes opened, and progress made in civilization. The work was one of extreme difficulty, largely because there was no central native authority with which to deal. Small military expeditions had constantly to be employed to break up slave-raiding gangs or reduce to order tribes which blocked trade routes or made war on other tribes living peaceably under British protection. The most serious military operations were against the Beni, a peaceful mission to the king of Benin having been massacred in the bush in Jan. 1897. The operations were completely successful and the Benin country was added to the protectorate (*see* BENIN). The administration improved the condition of the natives without undue interference with customary law. The submission of the Aros to the Government in 1902 brought to an end the system of tribal warfare for the purpose of making slaves, while a proclamation of 1901 prohibited the buying, pawning, or selling of slaves. Trade steadily developed, and owing to the large sums paid as duty on imported spirits the revenue of the protectorate was sufficient to cover the expenditure.

Northern Nigeria.—In Northern Nigeria at the time of the transfer (1900) British authority had still to be established. The man selected for the post of first high commissioner was Colonel (Lord) Lugard, who had conducted one of the Royal Niger company's most successful expeditions into the western portion of the interior and had already been employed by the British Government to raise and organize the West African Frontier Force.

On Jan. 1, 1900, the Union Jack was hoisted at Lokoja, and the formation of a local administration was entered upon. The headquarters of the West African Frontier Force had been at Jebba, not far from the point at which Mungo Park had lost his life upon the river. Neither Jebba nor Lokoja was considered suitable for the permanent capital of the protectorate and survey parties were sent out to find a more suitable site, with strict orders to avoid conflict with the nominally friendly natives. This was selected on a branch of the Kaduna river in the southwestern corner of the province of Zaria, at a place of which the native name of Zungeru was retained. The ruler of Zaria, while professing friendliness, was, however, unable or unwilling to restrain the rulers of Kontagora and Nupe from aggression. These two potentates raided for slaves to the borders of the rivers and openly threatened the British position on the Niger. The Ashanti War of 1900 claimed the despatch of a strong detachment of the West African Frontier Force, and it was not until the return of the troops in Feb. 1901 that Nupe and Kontagora could be effectively dealt with. In that year both provinces were subdued, their emirs deposed, and letters of appointment given to new emirs, who undertook to rule in accordance with the requirements of humanity, to abolish slave-raiding and slave dealing, and to acknowledge the sovereignty of Great Britain. Illorin and Borgu with a portion of Kabba were already under British rule. The rulers of other neighbouring provinces offered their allegiance, and by the end of the year 1901 nine provinces, Illorin, Kabba, Middle Niger, Lower Benue, Upper Benue, Nupe, Kontagora, Borgu and Zaria had accepted the British occupation. An initial system of administration was organized and British residents were appointed to each province. Seventeen legislative proclamations were enacted in the first year dealing with the immediate necessities of the position and providing for the establishment of a supreme and provincial court of justice, for the legalization of native courts of justice, and for regulating questions of slavery, importation of liquor and firearms, land titles, etc. In the autumn of 1901 the emir of Yola (the extreme eastern district in the territories bordering upon the Benue) was, in consequence of the aggressions upon a trading station established by the Niger Company, dealt with in the same manner as the emirs of Nupe and Kontagora, and a new emir was appointed. In 1902 Bauchi and Bornu were brought under British rule. Military stations were established in each and both were included in the system of British administration. Later in the same year an act of treachery culminating in the murder of a British resident, Captain Moloney, in the province of Nassarawa, led to the military subjugation of that province. By the end of the year 1902 British administration had been extended to the whole of the provinces in the south, east, and west of the protectorate. The important Mohammedan states of Sokoto, Gando, Kano, and Katsena remained independent. These states were regarded as the stronghold of Fula supremacy. The emir of Sokoto held the position of religious as well as political head of all the lesser states of Northern Nigeria, and in response to friendly overtures on the part of the British administration had declared that between Sokoto and Great Britain there could be nothing but war. Katsena was the centre of local learning, while Kano was at once the commercial and the military centre of power. By the end of 1902 it had become evident that a trial of strength between the Mohammedan powers and the new British administration was inevitable. The Mohammedan rulers were themselves of comparatively recent date. In fighting them there was no question of fighting the whole country. On the contrary it was presumed with justice that their overthrow would be hailed with satisfaction by many of the subject peoples. Every attempt was made to settle the question at issue by conciliatory methods, but, these having failed, a campaign against Kano and Sokoto was entered upon in Jan. 1903. It was entirely successful. The capital of Kano, a walled and fortified town of great extent and formidable strength, fell to a British assault in Feb. 1903. Sokoto submitted after a battle which took place on May 17. The sultan fled, and on May 21 a new sultan, chosen by the council of elders, was installed by the British high commissioner, after he had publicly accepted the conditions imposed by the British Government, namely, that all rights of conquest acquired by the Fulani throughout Northern Nigeria passed to Great Britain, that for the future every sultan and emir and principal officer of state should be appointed by Great Britain, that the emirs and chiefs so appointed should obey the laws of the British Government, that they should no longer buy and sell slaves, nor enslave people, that they should import no firearms, except flintlocks, that they should enforce no sentences in their courts of law which were contrary to humanity, and that the British Government should in future hold rights in land and taxation. When these conditions were accepted by the Fulani chiefs the supremacy of Great Britain was established over the entire country. Katsena and Gando followed the example set for them by Kano and Sokoto. After the conquest of the Hausa states in 1902–3 the King's writ ran—with the exception of a few districts inhabited by primitive savages—through the whole area known as Northern Nigeria.

THE AMALGAMATION OF NIGERIA

Union of Lagos and Southern Nigeria.—In 1904 it was decided to unite the two Nigerias and Lagos under one government, and as a first step in that direction Sir Walter (then Mr.) Egerton was appointed both governor of Lagos and high commissioner of Southern Nigeria. This was followed in Feb. 1906 by the amalgamation of these two administrations under the style of "the Colony and Protectorate of Southern Nigeria," with headquarters at Lagos town. The former colony and protectorate of Lagos (*q.v.*) became the western or Lagos province of the new administration. In the year of amalgamation the revenue reached a record figure, the amount collected being £1,088,000, to which Lagos province contributed £424,000. Over 80% of the revenue was derived from customs. In the same year the expenditure from revenue was £1,056,000.

Northern Nigeria Railway.—Northern Nigeria continued to be a separate protectorate, and in 1907 Sir Frederick Lugard was succeeded as high commissioner by Sir Percy Girouard. In August of that year the British Government, on administrative, strategic, and commercial grounds decided on a railway to give the cities of Zaria and Kano direct communication with the perennially navigable waters of the Lower Niger. In view of the approaching unification of Southern and Northern Nigeria, the money needed, about £1,250,000, was raised as a loan by Southern Nigeria. The route chosen for the line was that advocated by Sir Frederick Lugard. This important work, essential for the welfare of the northern territories, was begun under the superintendence of Sir Percy, the builder of the Wadi Halfa-Khartoum railway. At the same time the Lagos railway was extended to join the Kano line near Zungeru, the Niger being bridged at Jebba.

Land Tenure.—Sir Percy Girouard gave much attention to the land tenure, probably the most important of administrative questions in West Africa. He adopted the land policy of Sir Frederick Lugard and recommended "a declaration in favour of the nationalization of the lands of the protectorate." This was in accord with native laws—that the land is the property of the people, held in trust for them by their chiefs, who have not the power of alienation. In 1909 he was succeeded as Governor (the title High Commissioner having been changed) by Sir H. H. J. Bell; and meanwhile the secretary for the colonies had appointed a strong committee, which, after hearing much evidence, issued a report in April 1910 in substantial agreement with his recommendations. This policy was adopted by the Colonial Office and the natives of Nigeria were secured in the possession of their land—the Government imposing land taxes, which are the equivalent of rent. The exclusion of the European land speculator and denial of the right to buy and sell land and of freehold tenure was held by all the authorities to be essential for the moral and material welfare of the inhabitants of a land where the duty of the white man is mainly that of administration and his material advantages lie in trade.

Amalgamation of Northern Nigeria.—The constitution of Southern Nigeria (1906) left the protectorate still divided into two very different, and, for political purposes, distinct dependencies of the Crown. Southern Nigeria, with an area of about 76,000 sq.m., stretched inland from the Guinea coast through a tropical belt of generally dense forest land to a line irregularly corresponding with the latitude of 7′10″ N. Northern Nigeria, with an area of 255,700 sq.m., composed largely of open prairie, hill country, and dry desert plains, extended from the latitude of 7′10″ to the frontiers of the French and Zinder territory on the north, to French Dahomey on the west, and to the German Cameroons on the east. The population of Southern Nigeria was about 8,000,000 and the population of Northern Nigeria, with more than three times the area, was about 9,000,000. In both divisions primitive and very backward races had been overrun and influenced by civilizations of a higher type. In the south the new civilization had been European and Christian; in the north, Arab and Mohammedan.

The interdependence of these two regions was obvious and their amalgamation had long been urged upon the Imperial Government. It was not, however, until 1911 that the secretary for the colonies, Mr. L. V. Harcourt, determined to adopt the policy. Sir F. (Lord) Lugard, who had been the first high commissioner for Northern Nigeria, was asked to initiate and carry out a scheme of amalgamation, being in 1912 appointed governor at the same time of both Southern and Northern Nigeria. The preliminary work was completed in about 18 months, and on Jan. 1, 1914, the governments of Southern and Northern Nigeria were formally amalgamated, Sir Frederick Lugard receiving the personal title of governor-general. The geographical divisions of north and south were maintained. Two lieutenant-governors were appointed, one for the northern and one for the southern province. An administrator was appointed to the colony, the executive council of which became the executive council of the protectorate, while the jurisdiction of the legislative council was confined to the narrow limits of the colony's 1,400 sq.m.

At the time of amalgamation Northern Nigeria was divided into 12 provinces, the native communities being for the most part each under its native ruler, the five principal native states being known as first-class emirates, while each independent chieftainship, however small, retained its treasured liberty, and this system of government was maintained. The southern provinces at that period consisted of three divisions under provincial commissioners. They were the territories east of the Niger, west of the Niger, and the hinterland of Lagos. The native races in the hinterland of Lagos and to the east of the Niger were in a much less advanced state of tribal organization than were the tribes in the north and scarcely fitted for any form of enlightened self-rule. Fetish worship, cannibalism, and barbarous practices were rife. On the west of the Niger, however, three native states, Yoruba, Egbe, and Benin, were strongly organized. They were induced to renounce the exceptional position they enjoyed, under treaties made with Great Britain, and to accept conditions similar to those of the first-class emirates of the north. The introduction of the new system was accompanied by some difficulty, and in 1918 an easily suppressed rising in Egbeland gave momentary uneasiness. Indirect rule has now been fully accepted in both Egbeland and Yorubaland and the report of 1924 stated that it was working admirably in Benin. The way for the extension of such indirect rule as might be found possible was prepared by the division of Southern Nigeria into nine provinces (later increased), each under a British resident, as in the north.

The World War.—The outbreak of the World War within seven months of amalgamation postponed the consolidation of the new system. Patriotic sentiment in the protectorate ran high. Every department was depleted by volunteers for active service, and it was with difficulty that the administrative machine was held together with the remnant of overworked staff retained. For four years, the first thought of every Englishman in Nigeria was given to the war. And not of the Englishmen only. The War served at once to test and to exemplify the solid results of British rule. Throughout the War period the great native chiefs of the north were constant and unflagging in their loyalty.

The native troops of the West African Frontier Force did gallant service, both in the arduous campaign carried out under the leadership of Generals Dobell and Cunliffe in the Cameroons, and in what was to them foreign service in East Africa. The Cameroons campaign which opened in August and September 1914, with reverses all along the British line, at Mora (Aug. 25) and Garua (Aug. 29) in the north, and at Nsanakang (Sept. 6) in the south, lasted until Feb. 1916. It was a severe test for the troops engaged. The fighting was heavy, but they stood it well. Early in 1915 the campaign, in which French troops took an active part, was reorganized. British forces in the north were placed under the command of General Cunliffe, and the final taking of Garua and the storming of Banyo Hill under his leadership on Nov. 6, 1915, in face of a hail of dynamite bombs, was a feat of which any regiment might be proud. The conquered territory was divided between France and Great Britain, to be administered under mandate according to the provisions of the Treaty of Versailles. The portion taken by Great Britain was 31,000 sq.m., with an estimated population of 600,000 (*see* CAMEROONS).

Reforms.—While the war by arresting material development also delayed the application of schemes for the moral welfare of the native population, some progress was made. The judicial and legal systems of the two protectorates were, on amalgamation, combined. One chief justice for the whole of Nigeria and four puisne judges were appointed, and each lieutenant governor was provided with a legal adviser. The reorganization of the two systems and the revision of the laws of the two protectorates, was a long and heavy job. The first reforms were initiated in 1914. Notwithstanding the difficulties of the moment, an education ordinance was promulgated in 1916 having for its object the reform and co-ordination of the systems of the north and south. It set a definite standard, of which the principal aim was to substitute self-discipline and the formation of character for set examinations in literary subjects, and generally to fit local education to local needs. A forestry ordinance of the same year (1916) dealt with the rapid destruction of the forests, which constitute the principal wealth of the southern provinces.

Not the least achievement of the war period was the elimination of the traffic in foreign "trade spirits," on which the revenue of the southern provinces had largely depended. It was the declared policy of the amalgamated government to kill this trade by gradually raising the duty. Conditions of war hastened the process. Before the war the revenue from this traffic formed 34.26% of the revenue of southern Nigeria. By the end of the war it had fallen to a proportion of 1.23. It was held that this result established two important conclusions. First, that the government of Nigeria could dispense with revenue derived from spirits; secondly, that the produce trade could be conducted successfully without them. As from Feb. 1, 1919, the importation of trade spirits was formally prohibited in all the West African colonies and protectorates.

Constitutional Changes.—Sir F. (later Lord) Lugard retired at the end of the war, and Sir Hugh Clifford succeeded him as governor of Nigeria in July 1919. It was an era of prosperity, and at the end of Clifford's term of governorship great economic progress had been made. Sir Hugh's tenure of office was also notable for two modifications in the system of administration. The first was the extension and reorganization of the central secretariat, a step which in practice tended to curtail the responsibility and initiative of the lieutenant governors and residents of provinces. The second was the abolition of an advisory Nigerian council established under the amalgamation scheme, and the restoration of the jurisdiction of the legislative council for the colony over the whole of the southern provinces. In the new and enlarged council the elective principle was introduced. The introduction of this elective principle, of which experience in the West Indies has not been altogether encouraging, was new to West Africa, though it has since been applied to Sierra Leone and the Gold Coast. The new council retains an official majority, but includes three elected unofficial members representing the municipal area of Lagos, and one elected unofficial member representing the municipal area of Calabar. The unofficial element also includes members chosen by the three chambers of commerce (Lagos, Port Harcourt, and Kano) and the chamber of mines, two members representing respectively the banking and shipping interests, and eight the otherwise unrepresented African population of the colony and the southern provinces. The first elections for this council were held in Sept. 1923.

NIGHT, that part of the natural day of 24 hours during which the sun is below the horizon, the dark part of the day from sunset to sunrise (*see* DAY). The word in O. Eng. takes two forms *neaht* and *niht*, the latter form apparently being established by about the 10th century.

The word is common in varying forms to Indo-European languages. The root is usually taken to be *nak-*, to perish, the word meaning the time when the light fails (cf. Gr. *νέκυς*, Lat. *nex*, death; *nocere*, to hurt).

It was customary in former times to reckon periods of time by nights, and "fortnight" (O. Eng. *feowertyne niht*, 14 nights) is still used, but "se'n-night" (7 nights) has been displaced by "week" (*q.v.*).

NIGHTHAWK, an insect-hunting bird closely related to the goatsuckers of the old world, and less closely to the swifts and humming birds. The nighthawk (*Chordeiles virginianus*) belongs to the family Caprimulgidae, goatsuckers, so called from the fancy that they sucked the milk of goats. The wide skull, soft plumage, noiseless flight and nocturnal vision connect these birds with the owls.

The nighthawk wanders in migration from the Arctic ocean to southern South America, and breeds in eastern North America from Florida to Labrador. The eggs are laid on the ground or on the flat roof of a building. The Texan nighthawk (*Ch. acutipennis texensis*) has rusty-brown spots on the flight feathers.

NIGHTINGALE, FLORENCE (1820–1910), an Englishwoman, is generally accepted as being the originator and founder of modern nursing. Of almost equal importance are her achievements in the field of public health, especially those relating to the sanitary condition of hospitals and barracks, while by her example, her personality and her attainments she did more than perhaps any other one woman to bring about the emancipation of women.

The second daughter of wealthy and cultured parents, she was born in Florence, It., on May 12, 1820, and called after that city. Her character was complicated. To a mind of great power she united an intensely emotional temperament and a capacity for introspection amounting to self-torture, and from childhood her life was one of inner conflict.

Even at the age of six Florence felt herself frustrated and miserable in the idle luxury of her home. Her mother was socially ambitious, and when Florence grew up witty and pretty enough to be called a beauty, it was intended that she should make a brilliant marriage. Such ambitions were vain, however. In 1837, at the age of 17, Florence Nightingale received a call from God. It was not an inward revelation. She heard, as Joan of Arc heard, the voice of God speaking to her in human words and calling her to his service. A period of perplexity followed: what form of service was she to undertake? By 1844 her vocation had become clear, she was to tend the sick, to nurse.

A desperate struggle with her family ensued. Nursing at that time was disreputable, and nurses were frequently drunken prostitutes. Florence met furious opposition, was reproached, bullied, sent to Coventry and brought to the verge of mental collapse. Nevertheless she would not be turned from her determination. When Richard Monckton Milnes, later Lord Houghton, repeatedly pressed her to marry him, she refused even though she describes him as "the man I adore." Everything had to be sacrificed to her vocation. Even the ties of friendship might, she thought, weaken her will. Years passed in misery and frustration. It was not until 1851 that she was allowed to gain her first nursing experience with the Protestant deaconesses at Kaiserswerth in Germany and not until 1853, 16 years after her first call, that she left home to take her first post, the reorganization of a small hospital in Harley street, London, the Institution for the Care of Sick Gentlewomen in Distressed Circumstances.

The years had not been wasted. Studying in secret and corresponding with hospital authorities all over Europe she had made herself an expert in hospital administration. And she had acquired an iron self-control. The reorganization was a brilliant success, and it was her work in Harley street that led Sidney Her-

bert, secretary at war in the British cabinet and her intimate friend, to invite her to undertake a mission to the Crimea. War with Russia had been declared in March 1854; by October England was ringing with the horrible state of the British military hospitals revealed by the special correspondent of the *Times* (London). Florence Nightingale sailed for the Crimea with 38 nurses on Oct. 21, 1854, and within a month found that she had more than 5,000 men in her charge. The so-called hospitals were vast dilapidated buildings, filthy, bare, not merely lacking medical equipment but destitute of every convenience for common decency. By superhuman efforts she brought order out of chaos, working day and night, often on her feet for 20 hours at a stretch and hindered at every turn by official jealousy and intrigue. Every night she made a personal inspection and walked round the vast wards with her lamp—the barrack hospital alone had four miles of beds. It was this practice which inspired Longfellow to write his poem "Santa Filomena" and earned Florence Nightingale the title of "the Lady with the Lamp." But she did more than make the hospitals sanitary, she brought about a revolution in the treatment of the private soldier. In the words of an eyewitness, "she taught officers and officials to treat the soldiers as Christian men," and the army regarded her with something approaching worship.

When the story of her achievements and her tenderness to the wounded men reached home, there was a great outburst of enthusiasm, she became a national heroine and £45,000 was raised by public subscription as a testimonial and placed at her disposal.

But when she returned from the Crimea she insisted on going into retirement. She had dedicated her life to the welfare of the private soldier and she believed that her popularity would prejudice the government against her. She retired so completely that the public thought that she had died. In fact, however, with Sidney Herbert's help, she had embarked on a crusade for army reform; and in 1857, encouraged by Queen Victoria, she obtained a commission to inquire into the sanitary condition of the army. For the first time in history the food, housing and health of the soldier in peacetime were scientifically examined, and the commission marks the dawn of a new age in the health administration of armies. In 1858 she published an immense volume, *Notes on Matters Affecting the Health, Efficiency and Hospital Administration of the British Army*, which remains the standard work of its kind. In 1859 a commission was set up to inquire into the sanitary condition of the army in India, and in 1863 its report was submitted to Miss Nightingale. The amount of work that she did was almost incredible: the papers of the Indian sanitary commission alone filled two vans, and work for the army had gradually become only a part of her activities. Military hospitals had led her to civil hospitals, military nursing to civil nursing, military health to public health. In July 1860, with the sum subscribed as a testimonial, she opened the Nightingale training school for nurses at St. Thomas's hospital. From this date modern nursing may be said to commence. Every probationer entering the school was interviewed by her and remained under her close supervision. The strain was too great. Her health, shaken by her enormous exertions in the Crimea, gave way. She suffered a series of collapses and became an invalid. Nevertheless, though almost bedridden she continued to work and, living for work herself, became a ruthless taskmaster to others. Sidney Herbert had long been in poor health but, urged on by Miss Nightingale and by his wife, he struggled to perform the impossible. In 1861 he died from kidney disease aggravated by overwork. Yet Miss Nightingale toiled on. Her work still grew. The war office had come to lean on her advice, all sanitary papers were sent to her, she drew up regulations, framed warrants, reported on barrack plans. She was an acknowledged authority on India though she had never been there, and viceroy after viceroy came to her for his "Indian education." As the years went by thousands of nurses came under her control; after 1862 district nursing was brought into being under her guidance and the work involved in that alone would have occupied the whole time of an ordinary woman. Not until 1872, when she said that she "went out of office," did the fury of her work slacken. Then she became interested in mysticism, assisted Benjamin Jowett in the translation of the dialogues of Plato and compiled a book of extracts from the Christian mystics. Personal relationships, especially with young people, became of increasing importance and she enjoyed a tranquil old age, darkened only by the gradual loss of her sight. In 1907 she was awarded the Order of Merit. The announcement came as a surprise; most people thought she had died half a century before. She died on Aug. 13, 1910. By her express wish the offer of a national funeral and burial in Westminster abbey was refused, and her coffin was carried to the family grave in the little country churchyard of East Wellow, Hampshire, by six sergeants of the British army.

Bibliography.—Sir E. Cook, *Life of Florence Nightingale*, 2 vol. (London, 1913), which contains a bibliography of Miss Nightingale's writings; Lytton Strachey, essay in *Eminent Victorians* (New York, London, 1918); I. B. O'Malley, *Life of Florence Nightingale, 1820–1856; a Study of Her Life Down to the End of the Crimean War* (London, 1931); Cecil Woodham-Smith, *Florence Nightingale, 1820–1910* (Toronto, London, 1950). (C. W-Sh.)

NIGHTINGALE, the bird celebrated beyond all others by European writers for the vocal powers which, contrary to usual belief, it exercises at all hours of the day and night during some weeks after its return from its winter quarters in the south. The song itself is indescribable, though several attempts, from the time of Aristophanes to the present, have been made to express in syllables the sound of its many notes.

Poets have descanted on the bird (which they nearly always make of the feminine gender) leaning its breast against a thorn and pouring forth its melody in anguish. But the cock alone sings, and there is no reason to suppose that the cause and intent of his song differ in any respect from those of other birds' songs (*see* Song Birds.)

In contrast with the nightingale's voice is the inconspicuous coloration of the bird's plumage, which is alike in both sexes, and is of a reddish-brown above and dull grayish-white beneath, the breast being rather darker and the rufous tail showing the only bright tint.

The range of the European nightingale, *Luscinia megarhyncha*, is peculiar. In Great Britain it is abundant in suitable localities to the southeast of a line stretching from the valley of the Exe, in Devonshire, to York, but it does not visit Ireland, Wales or Scotland.

On the continent of Europe it does not occur north of a line stretching irregularly from Copenhagen to the northern Urals, and it is absent in Brittany. Over south Europe otherwise it is abundant.

The nightingale reaches Iran, and is a winter visitor to Arabia, Nubia, Abyssinia, Algeria and as far south as the Gold Coast. The larger eastern *L. philomela* is russet-brown in both sexes, and is a native of eastern Europe. *L. hafizi* of Iran is probably the Perso-Arabic bulbul of poets.

The nightingale reaches its English home about the middle of April, the males (as is usual among migratory birds) arriving several days before the females.

Poets and novelists are apt to command at will the song of this bird, irrespective of season. If the appearance of truth is to be regarded, it is dangerous to introduce a nightingale as singing in England before the 15th of April or after the 15th of June. The "early nightingale" of newspaper paragraphs is generally a thrush.

On the cocks being joined by their partners, the work for which the long and hazardous journey of both has been undertaken is speedily begun, and before long the nest is completed. This is of a rather uncommon kind, being placed on or near the ground, the outworks consisting chiefly of a great number of dead leaves ingeniously applied together so that the plane of each is mostly vertical. In the midst of the mass is wrought a deep cuplike hollow, neatly lined with fibrous roots, but the whole is so loosely constructed, and depends for lateral support so much on the stems of the plants among which it is generally built, that a very slight touch disturbs its beautiful arrangement.

Herein from four to six eggs of a deep olive colour are duly laid, and the young subsequently hatched. The nestling plumage of the nightingale differs much from that of the adult, the feathers above being tipped with a buff spot, just as in the young of the

redbreast, hedge sparrow and redstart, thereby showing the natural affinity of all these forms. Toward the end of summer the nightingale disappears to its African winter haunts.

The name nightingale has been applied to several other birds. The so-called "Virginian nightingale" is a species of grosbeak (*q.v.*); the "Pekin nightingale" or "Japanese nightingale" is a small babbler (*Liothrix luteus*) of the Himalayas and China.

The nightingale holds a place in classical mythology. Procne and Philomela were the daughters of Pandion, king of Attica, who in return for warlike aid rendered him by Tereus, king of Daulis in Thrace, gave him the first-named in marriage. Tereus, however, being enamoured of her sister, feigned that his wife was dead, and induced Philomela to take her place. On her discovering the truth he cut out her tongue to hinder her from revealing his deceit; but she depicted her sad story on the robe which she sent to Procne; and the two sisters then contrived a horrible revenge for the infidelity of Tereus, by killing and serving to him at table his son Itys. Thereupon the gods interposed, changing Tereus into a hoopoe, Procne into a swallow, and Philomela into a nightingale, while Itys was restored to life as a pheasant, and Pandion (who had died of grief at his daughters' dishonour) as a bird of prey (*see* OSPREY). The fable has several variants. Ovid's version may be seen in the 6th book of his *Metamorphoses* (lines 412–676).

NIGHTJAR or **GOATSUCKER** (*Caprimulgus europaeus*, Linn.), a bird erroneously believed since very ancient days to have the habit implied by its second name. It is characterized by its flat head, wide mouth fringed with bristles, large eyes, soft plumage and consequently noiseless flight. It arrives in Europe from Africa late in the spring, returning in the early autumn. Its food consists of insects, chiefly moths and cockchafers, which it catches on the wing at night. When resting on a bough the nightjar sits along its length. In this position the cock bird utters his curious burring note. The eggs are laid on the ground, and number two; the young are clad in dark-spotted down, rendering them, like their parents, exceedingly difficult to see when crouching on the ground.

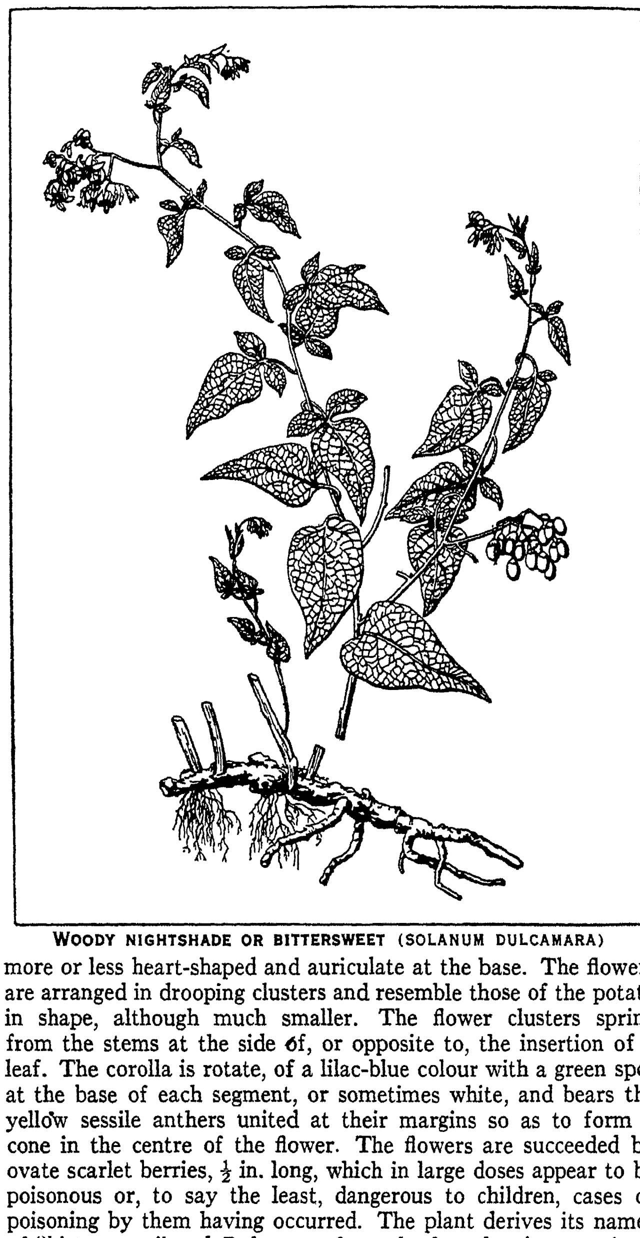
FROM KOEHLER, "MEDIZINAL PFLANZEN"

DEADLY NIGHTSHADE OR DWALE (ATROPA BELLADONNA), SHOWING BRANCH WITH FLOWERS AND FRUIT

A second species, *C. ruficollis*, occurs in Spain and Portugal and others are found throughout the old world. In America their place is taken by the allied genus, *Antrostomus*, one member of which, *A. vociferus*, is the whip-poor-will (*q.v.*). The nighthawk (*q.v.*) is another common American species, with a voice quite different from that of the whip-poor-will.

The family Caprimulgidae is almost cosmopolitan, but is not represented in New Zealand and Polynesia.

NIGHTSHADE, a general term for plants of the botanical genus *Solanum* (family Solanaceae). The species to which the name of nightshade is commonly given in England and North America is *Solanum Dulcamara* which is called also bittersweet or woody nightshade. It is a common plant in damp hedgebanks and thickets, scrambling over underwood and hedges. It has slender slightly woody stems, with alternate lanceolate leaves more or less heart-shaped and auriculate at the base. The flowers are arranged in drooping clusters and resemble those of the potato in shape, although much smaller. The flower clusters spring from the stems at the side of, or opposite to, the insertion of a leaf. The corolla is rotate, of a lilac-blue colour with a green spot at the base of each segment, or sometimes white, and bears the yellow sessile anthers united at their margins so as to form a cone in the centre of the flower. The flowers are succeeded by ovate scarlet berries, $\frac{1}{2}$ in. long, which in large doses appear to be poisonous or, to say the least, dangerous to children, cases of poisoning by them having occurred. The plant derives its names of "bittersweet" and *Dulcamara* from the fact that its taste is at first bitter and then sweet. It is a native of Europe, North Africa and temperate Asia, and is widely naturalized.



WOODY NIGHTSHADE OR BITTERSWEET (SOLANUM DULCAMARA)

The black nightshade, *S. nigrum,* differs from *S. Dulcamara* in having white flowers in small umbels and globose black berries. It is a common and well nigh cosmopolitan weed in gardens and waste places, growing about 12 or 18 in. high, and has ovate, entire or sinuate or toothed leaves. The berries have been known to produce poisonous effects when eaten by children, and owe their properties to the presence of solanine. In most tropical countries the leaves are eaten as a pot herb. (*See* SOLANUM.)

Deadly nightshade, dwale or belladonna (*Atropa belladonna*) is a tall bushy herb of the same plant family. It grows to a height of 4 or 5 ft., having leaves of a dull green colour, with a black, shining, berry fruit, about the size of a cherry, and a large tapering root. The plant is a native of central and south Europe,

extending into Asia, and is found locally in England, chiefly on chalk and limestone, from Westmorland and southward. The entire plant is highly poisonous, and accidents not infrequently occur because children and unwary persons eat the attractive looking fruit. Its leaves and roots are largely used in medicine on which account the plant is cultivated, chiefly in south Germany, Switzerland and France.

The name nightshade is applied to plants of different genera in other countries.

NIGRA, COSTANTINO, Count (1828–1907), Italian diplomatist, was born at Villa Castelnuovo, in the province of Turin, on June 11, 1828. During the war of 1848 he interrupted his studies to serve as a volunteer against Austria, and was wounded at the battle of Rivoli. On the conclusion of peace he entered the Piedmontese foreign office; he accompanied Victor Emmanuel and Count Camillo Benso di Cavour to Paris and London in 1855, and in 1856 he took part in the conference of Paris by which the Crimean War was brought to an end. After the meeting at Plombières between Cavour and Napoleon III, Nigra was sent to Paris as an agent of Cavour. After the breach with Napoleon he was secretary of state to the prince of Carignano, viceroy of the Neapolitan provinces. When Napoleon recognized the kingdom of Italy in 1861, Nigra returned to France as minister resident, and for many years played a most important part in political affairs. In 1876 he was transferred to St. Petersburg with the rank of ambassador, in 1882 to London, and in 1885 to Vienna. In 1899 he represented Italy at the first Hague peace conference. In 1904 he retired, and he died at Rapallo on July 1, 1907. He was created count in 1882 and senator in 1890.

NIHILISM, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of the reign of Alexander II. The term was first used by Ivan Turgenev in his celebrated novel, *Fathers and Sons,* published in 1862. (*See* Russia: *History* and Anarchism.)

NIIGATA, the chief town and capital of the prefecture of Niigata, Japan. Pop. (1950) 220,901. It occupies an area of rather more than 1 sq.mi., and consists of five long parallel streets intersected by cross streets, which in most cases have canals running down the middle and communicating with the river, so that the internal traffic of the city is mainly carried on by water. The town has been brought within the railway circuit, and the production of petroleum has been developed in the district. There is a large manufacture of lacquer ware in the town, and since 1931 modern industries have been developed.

The prefecture of Niigata has an area of 4,856 sq.mi. and a population (1950 census) of 2,460,997.

NIJAR, a town of southeastern Spain, in the province of Almería; on the southern slope of the Sierra Alhamilla, and on the small river Artal, which flows into the Mediterranean sea 6 mi. S.W. Pop. (1940) 1,925 (mun., 10,071). Lead, iron and manganese are mined near by; the fertile plain watered by the Artal yields an abundance of wheat, fruit, olives and esparto grass; fine porcelain and woollen and cotton goods are manufactured there.

NIJMEGEN, or Nijmwegen, a residential town in the province of Gelderland, the Netherlands, on the left bank of the Waal, 24½ mi. S.E. of Tiel by rail. Pop. (1940), 94,103. It has regular steamboat communication with Rotterdam, Cologne and Arnhem, and is very prettily situated on the slopes of five low hills rising from the riverside. Steps are necessary to lead to the higher portions of the town. In 1877–84 the old town walls were demolished, a promenade and gardens taking their place, and subsequently a new quarter grew up on the south side with a fine open place called the Emperor Charles's plain. On the east of the town is the beautiful park called the Valkhof, which marks the site of the old palace of the Carolingian emperors. The palace was ruined by the French bombardment of 1794, and only two portions of it remain. These are a part of the choir of the 12th century palace-church, and a 16-sided baptistry originally consecrated by Pope Leo III in 799 and rebuilt in the 12th or 13th century. Close by is the lofty tower of the Belvedere, dating from 1646. The *Groote Kerk* of St. Stephen forms with its tall square tower one of the most striking features of the town. Originally built about 1272, it dates in its present condition mainly from the 15th and 16th centuries. The interesting Renaissance town hall was built in 1554 (restored in 1879). There is also an interesting museum of antiquities. Other buildings of note include the old weighhouse and Flesher's hall, probably built in 1612 and restored in 1885.

Nijmegen is the seat of a Roman Catholic university.

Beer, Prussian blue, leather, tin, pottery, cigars and gold and silver work are the chief industrial products. The town was occupied by Germany during World War II.

NIJNI-NOVGOROD (now called Gorky), chief town of Gorky region, Russian S.F.S.R., at the confluence of the Oka and Volga rivers in 56° 24′ N., 44° E. Pop. (1939) 644,116. The city owes its importance to its position at the junction of the navigable rivers between which, to the west of it, was the flourishing Moscow region, though the development of its trade, at first mainly in furs, was much hampered by Tatar raids, which did not cease until the second half of the 16th century. After the last raid in 1536 it became a depot for goods brought from the southeast, and the conquest of Kazan in 1552 and of Astrakhan in 1556 opened free navigation on the Volga. The thick forests of the district provided material for shipbuilding and a yearly "caravan" of boats under military protection began to carry the products of Moscow and the north to the Caspian and to return laden with the products of the south and east.

The Fair.—From remote antiquity Russian merchants were accustomed to meet in summer with those from the east at different places on the Volga between the mouths of the eastward flowing Oka and the westward flowing Kama, the fair changing its site with the increasing or decreasing power of the nationalities which struggled for the possession of the middle Volga. Bolgari, Nijni-Novgorod, Kazan and Vasilsursk have been successively the site of the fair since the 10th century. From 1641 its seat was at a monastery 55 mi. below Nijni and close to Makaryev; this situation later proved inconvenient, and after the destruction of the shops by fire, the fair was transferred to Nijni in 1817 and has remained there ever since.

The long distances in Russia, the poor network of communications, the seasonal nature of production and river transport, the dependence of the peasant on handicrafts as a supplement to agriculture, the close link between Russia and the orient, are some of the factors which have tended to preserve the importance of fairs as a medium of exchange and barter. In the more industrialized regions of the south and west, with their better railway facilities and higher level of literacy, fairs are gradually dying out, but in other regions they are still of the greatest importance for home trade. The state grants special customs exemptions to goods destined for the Nijni fair and gives cheaper transport facilities and special credits to traders. Products of the peasant home industries from every region in which they are at all developed are increasingly taking an important place in the fair.

Until the 1880s Russian manufacturers depended largely on barter trade in tea from Kiakhta and its price at the fair regulated output. Later the price of raw cotton and madder from Asia at the fair influenced the output of the growing textile industry of the central productive region. The owners of the iron works in the Ural district sent "caravans" of boats laden with iron goods to Nijni, where the purchases of iron made for Asia and middle Russia determined the amount of credit on which they could depend for the next year's work. Similarly the corn and salt trade of the south and the general trade of Siberia and Turkistan depended on the prices obtaining at the fair.

The fair reached its highest development between 1880 and 1884, when the turnover was 21,500,000 lb. In 1910 the turnover was 15,900,000 lb. During the 1914–1922 war and civil war, the trade of Nijni was interrupted, and when the fair re-opened in 1923, conditions had altogether changed. Private trade, though not entirely suppressed, had been markedly reduced and the various state trading departments and local goods exchanges had taken over much of the regulation between supply and demand, formerly largely dependent on the fair. Only 647 firms took part in the 1923 fair and the turnover was small, but

trade has gradually adapted itself to the changed conditions and in 1927 the turnover was 20,300,000 lb., and the number of firms taking part was 2,549.

Trade with the Ural metal region via the Kama, with Siberia and with the corn, salt, wine and naphtha regions of the Caspian has revived. The duration of the fair is fixed for Aug. 1 to Sept. 15. A horse fair is held in June, and one in January on the ice of the river Oka for wooden goods made by the peasants, the river being frozen from November to April.

In addition to its trading activities the town has shipbuilding and repair yards and manufactures machinery, telephones, chemicals, sewn goods, matches, bricks, flour, confectionery and alcoholic drinks. These industries are now supplied with electricity from the Balakhna peat fuel plant. Another established industry is the making of radio sets, in connection with which there is an experimental station. The town has railway links through Vyatka with Perm and Sverdlovsk, and also with Kotlas, which will probably be linked with Murmansk via Soroka at no distant date, with Moscow, and, by a branch line to Arzamas, with the trans-Siberian railway. There is also a short branch to Pavlov. Steam navigation on the Volga began in 1821, and developed rapidly after 1845. A bi-weekly air service between Moscow and Nijni-Novgorod was established, with daily services during the period of the fair.

The Town consists of three parts. The upper city is built on three hills on the right bank of the rivers (490 ft.). On one of them is the ancient citadel or Kremlin, first erected as a palisaded fort in the second half of the 14th century, and rebuilt in the early 16th century, with a wall 2,300 yards long, 65 to 95 ft. high and having 11 towers. Within it are the law courts, the former governor's residence, the arsenal, barracks, etc., a museum and the Preobrazhensky and Archangel cathedrals, dating from 1225 and 1222 respectively, but much spoilt by later restorations. Kózma Minin Sukhorukov, a cattle-dealer of the town, who organized the army that saved Moscow from Polish dominion in 1612, is buried in the Preobrazhensky cathedral, and a square in the Kremlin contains a monument to Minin and Pozharsky erected in 1826. The view from the Kremlin of the broad Volga with its low-lying and far-spreading left bank is very striking. Near the Kremlin are two monasteries, the Pechersky, built in the first half of the 16th century to replace one founded in 1330 and destroyed by a landslip in 1596, and the Blagovyeshchensk (1370, rebuilt 1647). Five descents lead to the lower town, the Nijni bazaar, built on the alluvial terrace 30 to 35 ft. above the banks of the Oka and Volga.

The fair is held on the flat sandy tongue of land between the rivers, connected with the town by a bridge of boats, 1,500 yards long, which is taken to pieces in winter. The shops of the fair, 4,000 in number, built of stone in regular rows, are surrounded by a canal and cover half a square mile, and there are more than 4,000 other shops outside this inner fair. There are salt, grain and timber wharves and rough goods are landed on an island in the Volga. Tea boxes and temporary shelters for the tea tasters accumulate in the Siberian harbour during fair time. The point of the peninsula is occupied by the storehouses of the steamboat companies, while metal wares and corn are discharged on a long island in the Oka, at the iron harbour, and in the Grebnovskaya harbour. The railway from Moscow has its terminus close to the fair buildings, to the south of which is the Kunavino pleasure suburb. On the fair side are the Alexander Nevsky cathedral (1881) and the "Fair" cathedral (1822). The climate is harsh and continental, average January temperature 10.6° F., July 64° F., extreme readings −40° F. and +104° F.

History.—The confluence of the Oka and the Volga, inhabited in the 10th century by Mordvinian tribes, began to be coveted by the Russians as soon as they had occupied the upper Volga, and as early as the 11th century they established a fort, Gorodets, 20 mi. above the mouth of the Oka. In 1221, the people of Suzdal, under Yuri Vsevolodovich, prince of Vladimir, erected a fort on the hill now occupied by the Kremlin. Until the beginning of the 14th century Nijni-Novgorod, which grew rapidly as the Russians colonized the banks of the Oka, remained subject to Suzdal; it enjoyed, however, almost complete independence, being ruled by its popular assembly. Until 1390, it elected its only princes. Ill-protected by its palisaded walls, it was plundered in 1377 and 1378 by the Tatars, supported by the Mordvinians.

In 1390 Prince Vasili of Moscow, in alliance with Toktamish, khan of the golden horde of the Mongols, took Nijni and established his own governors there; in 1417 it was definitely annexed to Moscow, becoming a stronghold for the further advance of that principality toward the east. It was fortified in 1508–1511, and was able to repel the Tatars in 1513, 1520 and 1536. In 1606–1611 the trading classes took an active part in the expeditions against the revolted serfs. A Nijni cattle-dealer, Sukhorukov, helped to deliver Moscow from the Poles in 1612. In 1667 the city withstood an attack by Stenka Razin. During the 17th century the country became the seat of a vigorous religious agitation, and in its forests the Raskolniks established hundreds of their monasteries and communities, those of the Kerzhenets playing an important part in the history of Russian nonconformity.

Nijni-Novgorod had some part in the literary movement of the end of the 18th century; its theatre also was of some importance in the history of the Russian stage. It has a growing university and a Workers' Scientific institute opened since the 1917 revolution.

The city was renamed Gorky in 1932 after the writer Maxim Gorky, born in Nijni-Novgorod on March 16, 1868.

NIKĒ, the goddess of victory (Gr. νίκη, Lat. *Victoria*). She does not appear personified in Homer. In Hesiod (*Theog.* 384) she is the daughter of the giant Pallas and Styx, and is sent to fight on the side of Zeus against the Titans. Nikē does not appear to have been the object of a separate cult at Athens. She was at first inseparably connected and confounded with Pallas Athena, the dispenser of victory, but gradually separated from her. As an attribute of both Athena and Zeus she is represented as a small figure carried by those divinities in their hand. Athena Nikē was always wingless, Nikē alone winged. In works of art she appears carrying a palm branch or a wreath (sometimes a Hermes staff as the messenger of victory) erecting a trophy or recording a victory on a shield, or, frequently, hovering with outspread wings over the victor in a competition, since her functions referred not only to success in war but to all other human undertakings. In fact, Nikē gradually came to be recognized as a sort of mediator of success between gods and men.

At Rome Victoria was worshipped from the earliest times. Evander was said to have erected a temple in her honour on the Palatine before the foundation of Rome itself (Dion. Halic. i, 32, 33). She was identified with the obscure Sabine goddess Vica Pota and others. Special games were held in her honour in the circus, and generals erected statues of her after a successful campaign. She came to be regarded as the protecting goddess of the senate, and her statue (originally brought from Tarentum and set up by Augustus in memory of the battle of Actium) in the Curia Julia (Dio Cassius li. 22; Suetonius, *Aug.* 100) was the cause of the final combat between Christianity and paganism towards the end of the 4th century. Victoria had altars in camp, a special set of worshippers and colleges, a festival on Nov. 1, temples at Rome and throughout the empire. Representations of Nikē-Victoria in art are very numerous. *cf.* GREEK ART (fig. 3).

See L. R. Farnell, *Cults of the Greek States,* i (1896); G. Wissowa, *Religion und Kultus* (2nd ed. 1912) (bibl.); Roscher's *Lexikon,* arts. "Niké," "Victoria."

NIKISCH, ARTHUR (1855–1922), Hungarian conductor, was a precocious child, making a public appearance as a pianist at eight years old. He studied at the Vienna Conservatoire from 1866 to 1873, and while there he composed a symphony and other works. In 1877 he began as assistant conductor at the Leipzig opera and two years later became chief conductor. His brilliant success in Leipzig gave him a world-wide reputation. Nikisch was conductor of the symphony orchestra at Boston, U.S.A., from 1889 to 1893; and subsequently, after having been director at the Budapest opera, at the Leipzig Gewandhaus. He died in Leipzig on Jan. 23, 1922.

NIKKO, a small town in Tochigi prefecture. One of the chief centres of pilgrimage and sightseeing in Japan, it lies 91 mi. N. of Tokyo by rail, in a valley below the range called Nikko-Zan (Mountains of the Sun's Brightness). Its natural beauties and the splendour of its monuments gave rise to a popular saying: "Do not say 'splendid' (*Kekkō*) until you have seen Nikko." A Shinto shrine seems to have existed from time immemorial and in 767 its first Buddhist temple was founded by Shōdō Shōnin (the subject of many legendary adventures); but the main celebrity of the place is due to the sepulchres and sanctuaries of Iyeyasu and Iyemitsu, the first and third shoguns of the Tokugawa dynasty. Iyeyasu was buried with amazing pomp in 1617, and Iyemitsu, his grandson, was slain in 1650 while visiting his tomb. From 1644 to 1868 the "abbots" of Nikko were always princes of the imperial blood; thirteen of them are buried within the sacred grounds.

NIKOLAYEV, a seaport of the Ukrainian S.S.R., situated a little above the confluence of the Ingul and Bug rivers, at the head of the Bug estuary in 46° 58′ N., 31° 58′ E. Pop. (1939) 167,108. Vessels have to pass the bar of the Dnieper to reach the Ochakov channel, and dredging has been carried out to a depth of 25 ft., so that vessels of 24 ft. draught can pass without lightening their loads. Two icebreakers are now working so as to keep the estuary of the Dnieper and the channel of the Bug open for navigation from the Black sea to Nikolayev all the year round. There is a government commercial quay and a harbour for coasting vessels. The Varvarovka jetty was damaged during the civil war. There are floating elevators and a railway grain elevator. The chief imports are cement, iron, steel, machinery and general merchandise, and the exports are grains, oilseeds, sugar, wool, iron ore, manganese and timber.

In common with other Black sea ports, Nikolayev suffered from the effects of the civil war and the war of intervention and from the decrease in Black sea trade due partly to change of frontiers and partly to war damage and loss of ships and the cessation of repairs and construction until 1923. The town has ship yards where steamers for the admiralty and for the commercial fleet are built, the construction of armoured ships and torpedo boats dating back to 1870, and being carried out mainly along the bank of the Ingul river. Ochakov and Kimburn are potential forts to protect the double estuary in case of attack. The industrial enterprises of Nikolayev include the manufacture of machinery, ploughs, nails, glass, footwear, macaroni, tobacco and alcoholic drinks. The town is linked by rail with the general railway net to the north, and also has a branch to Kherson.

The remains of the Greek colony *Olbia* have been discovered close to the confluence of the Ingul with the Bug, 10 m. S. of Nikolayev. After the fall of Ochakov, Prince Potemkin established (1789) a wharf on the Ingul which received the name of Nikolayev.

NIKOLAYEVSK: *see* PUGACHEVSK.

NIKON [NIKITA MININ] (1605–1681), 6th patriarch of Moscow, Russian reformer and statesman, son of a peasant farmer named Mina, was born on May 7, 1605, in the village of Valmanovo, 90 versts from Nijni-Novgorod. Misery pursued the child from his cradle, and prematurely hardened a character not naturally soft; he ran away from home to save his life from an inhuman stepmother. He took orders, and became a popular preacher in Moscow, then, seeing in the loss of his three little children a providential warning to seek the higher life, he first persuaded his wife to take the veil, and then withdrew himself first to a desolate hermitage on the isle of Anzersky on the White Sea, and finally to the Kozhuzersky monastery, in the diocese of Novgorod, of which he became abbot in 1643. On becoming a monk he took the name of Nikon. In his official capacity he had frequently to visit Moscow, and in 1646 made the acquaintance of the pious and impressionable Tsar Alexius, who fell entirely under his influence. Alexius appointed Nikon archimandrite, or prior, of the wealthy Novospassky monastery at Moscow, and in 1648 metropolitan of Great Novgorod. Finally (Aug. 1, 1652) he was elected patriarch of Moscow. It was only with the utmost difficulty that Nikon could be persuaded to become the archpastor of the Russian Church, and he only yielded after imposing upon the whole assembly a solemn oath of obedience to him in everything concerning the dogmas, canons and observances of the Orthodox Church.

Ecclesiastical reform was already in the air. A number of ecclesiastical dignitaries, known as the party of the protopopes (deans), had accepted the responsibility for the revision of the church service-books inaugurated by the late Patriarch Joasaf, and a few other very trivial rectifications of certain ancient observances. Nikon was bolder and more liberal. He consulted the most learned of the Greek prelates abroad; invited them to a consultation at Moscow; and finally the scholars of Constantinople and Kiev opened the eyes of Nikon to the fact that the Muscovite service-books were heterodox, and that the ikons actually in use had very widely departed from the ancient Constantinopolitan models, being for the most part imitations of later Polish and Frankish (West European) models. He at once (1654) summoned a properly qualified synod of experts to re-examine the service-books revised by the Patriarch Joasaf, and the majority of the synod decided that "the Greeks should be followed rather than our own ancients." A second council, held at Moscow in 1656, sanctioned the revision of the service-books as suggested by the first council, and anathematized the dissentient minority, which included the party of the protopopes and Paul, bishop of Kolomna. Heavily weighted with the fullest oecumenical authority, Nikon's patriarchal staff descended with crushing force upon the heterodox. His scheme of reform included not only service-books and ceremonies but the use of the "newfangled" ikons, for which he ordered a house-to-house search to be made. His soldiers and servants were charged first to gouge out the eyes of these "heretical counterfeits" and then carry them through the town in derision. He also issued a *ukaz* threatening with the severest penalties all who dared to make or use such ikons in future. This ruthlessness goes far to explain the unappeasable hatred with which the "Old Ritualists" and the "Old Believers," as they now began to be called, ever afterwards regarded Nikon and all his works.

From 1652 to 1658, Nikon was not so much the minister as the colleague of the tsar. Both in public documents and in private letters he was permitted to use the sovereign title. Such a free use did he make of his vast power, that some Russian historians have suspected him of the design of establishing "a particular national papacy"; and he himself certainly maintained that the spiritual was superior to the temporal power. He enriched the numerous and splendid monasteries which he built with valuable libraries. His emissaries scoured Muscovy and the Orient for precious Greek and Slavonic mss., both sacred and profane. But his severity raised up a whole host of enemies against him, and by the summer of 1658 they had convinced Alexius that the sovereign patriarch was eclipsing the sovereign tsar. Alexius suddenly grew cold towards his "own familiar friend." Nikon thereupon publicly divested himself of the patriarchal vestments and shut himself up in the Voskresensky monastery (19th of July 1658). In February 1660 a synod was held at Moscow to terminate "the widowhood" of the Muscovite Church, which had now been without a pastor for nearly two years. The synod decided not only that a new patriarch should be appointed, but that Nikon had forfeited both his archiepiscopal rank and his priest's orders. Against the second part of this decision, however, the great ecclesiastical expert Epifany Slavenitsky protested energetically, and ultimately the whole inquiry collapsed, the scrupulous tsar shrinking from the enforcement of the decrees of the synod for fear of committing mortal sin.

For six years longer the Church of Muscovy remained without a patriarch. Every year the question of Nikon's deposition became more complicated and confusing. At last the matter was submitted to an oecumenical council, which opened its sessions on Nov. 18, 1666, in the presence of the tsar. On Dec. 12 the council pronounced Nikon guilty of reviling the tsar and the whole Muscovite Church, of deposing Paul, bishop of Kolomna, contrary to the canons, and of beating and torturing his dependants. His sentence was deprivation of all his sacerdotal functions;

henceforth he was to be known simply as the monk Nikon. The same day he was sent as a prisoner to the Therapontov Byelozersky monastery. Yet the very council which had deposed him confirmed all his reforms and anathematized all who should refuse to accept them. Nikon survived the tsar (with whom something of the old intimacy was resumed in 1671) five years, expiring on Aug. 17, 1681.

NIKOPOLI or NICOPOLIS (Bulgarian *Nikopol*), the chief town of a subprefecture in the district of Plevna (Pleven), Bulgaria. Pop. (1934) 5,040. Nikopoli is picturesquely situated on the south bank of the Danube, where it receives the Osem. The chief industries are tanning and fishing. As a military post the town has for centuries been important. A ruined castle still dominates the place, and fortifications stretch down to the river.

Nikopoli occupies the site of the ancient Asamus, but by some mediaeval confusion bears the name of Nicopolis ad Istrum, which was founded by Trajan several miles down the river, at the inflow of the Iatrus or Yantra, at the spot still called Nikup. The following are the chief points in the modern history of the place: —capture of the fortress by Sigismund of Hungary in 1392 and 1395; defeat of Sigismund and his hosts in 1396 by Bayezid I; siege of the town by King Ladislaus I of Hungary in 1444; defeat of the Turks by Bathori in 1595 and by Michael of Walachia in 1598; capture of the town by Pasvan-oglu in 1797; occupation of the fortress by the Russians under Kamensky in 1810; destruction of the Turkish flotilla by Govarov in 1829; capture and burning of the town by the Russians under Krüdener, June 15, 1877.

NIKŠIĆ, a romantically situated town of Montenegro, Yugoslavia, in the valley of the Zeta, which forms the main source of communication between north and south Montenegro. Pop. (1931) 4,164. Wheat, maize, rye and potatoes are cultivated, and there are two breweries, cloth and cotton mills in the town, which is an important mart for timber, hides, farm produce and livestock. The chief road, to Podgorica (*q.v.*), is entered by a long viaduct, the gift of Russia, to obviate the flooding which formerly often rendered it impassable. The town, of white houses, is built round a square with four radiating streets, and is dominated by the pale yellow cupola of the Byzantine cathedral, another gift from Russia. Close by stands a royal palace and on one of the heights are the ruins of an old Turkish fortress.

Nikšić was occupied by Italian troops in 1941. About 12 mi. S.E. is the famous shrine of Ostrog (*see* MONTENEGRO).

NILE, an African river whose basin is the dominant feature of the northeastern quarter of the continent. Its length as the water flows from its most distant source to the entry of the Rosetta branch into the Mediterranean is about 4,160 mi. This source is the head of the Luvironza in lat. 3° 50′ S. and about 40 mi. E. of Lake Tanganyika. There is a probability that the Nile may be the longest river in the world. The Mississippi-Missouri was once taken to be the longest, but the U.S. army engineers later gave the length from the most remote source of the Missouri to the sea as 3,891 mi. There is reason to think that the Amazon is more than 4,000 mi. long, but its length is taken from maps on a scale of 1:1,000,000, while the Nile has been measured from maps on scales ranging from 1:100,000 to 1:250,000. More detailed maps of the Amazon on a larger scale would be likely to increase its estimated length because of the effect of sinuosity. The name Nile comes from the Latin *Nilus* and Greek Νεῖλος, whose origin is unknown. Αἴγυπτος in the Odyssey is the name of the Nile (masc.) as well as of the country of Egypt (fem.) through which it flows and survives both in the name Egypt and in the name Copt (*gupti* in the Arabic of Upper Egypt). At the present time the Nile in Egypt and in the northern Sudan is called en-Nil, or el-Bahr ("the river"), or el-Bahr en-Nil.

General Account.—The basin covers approximately 1,100,000 sq.mi. or about one-tenth of the area of Africa. Politically it includes Uganda, parts of Kenya, of Tanganyika and of the Belgian Congo, most of the Sudan, part of Ethiopia (Abyssinia) and the cultivated portion of Egypt. Its rapidly increasing population was estimated as roughly 40,000,000 in 1954, of whom more than half live in Egypt. It is possible to travel by car in the dry season over most of the basin; but south of lat. 15° N. over the plains of the Sudan motor transport is not usually possible from May to November. In the higher country leading up to the Lake plateau and the Nile-Congo watershed and on the Lake plateau there are all-weather roads.

Three principal streams form the Nile. The largest in volume is the Blue Nile which draws practically all its water from Ethiopia and contributes four-sevenths of the total supply of the main stream. Next comes the White Nile, which is the longest branch and supplies two-sevenths of the total; its headstreams flow into Lakes Victoria and Albert; and lower down in the Sudan it receives the Sobat, which obtains its water mainly from Ethiopia. The White Nile and Blue Nile join at Khartoum. Lastly there is the Atbara, draining the northwestern part of Ethiopia and joining the main stream 200 mi. N. of Khartoum, and contributing the remaining one-seventh. The Blue Nile and Atbara are both muddy streams in flood time and bring down the soil which has made the cultivable land of Egypt and is still adding to it. From the Atbara junction to within a few miles of the Mediterranean there is not enough rain to produce any crops, and so this area depends entirely on irrigation by Nile water. The river is navigable from the sea to Wadi Halfa (about 960 mi.), and the Aswan dam and the barrages are passed by locks. Between Halfa and Khartoum the river is broken up by the cataracts, and ordinarily navigation is only possible in short stretches. From Khartoum the White Nile is navigable for 1,100 mi. to Rejaf, 100 mi. from the Uganda border, the Jebel Aulia dam (25 mi. S. of Khartoum) being passed by a lock. From Rejaf to the Uganda border the river is again beset with rapids, but there is navigation from Nimule on the border into Lake Albert and up the Victoria Nile to the foot of the Murchison falls. Between Lakes Albert and Victoria there are two successions of rapids with a navigable stretch which includes Lake Kyoga (Kioga) between them. The Blue Nile is navigable during flood for 400 mi. as far as Roseires, though it is interrupted by the Sennar dam which has no lock. During the flood season the Sobat is navigable up to Gambela and the Bahr el-Ghazal up to Wau. Regular air services operate on important routes throughout the Nile basin, including Ethiopia.

The White Nile.—The main stream of the White Nile begins on the Lake plateau of East Africa, where there are two separate river systems, the Victoria Nile and the Lake Albert system. Most of this country lies 4,000 ft. or more above sea level and on this account enjoys a pleasant climate. Two rivers, the Niavarongo (Nyawarongo) and Ruvuvu, may justly be considered the headwaters of the White Nile, since they join together to form the Kagera, the most important tributary of Lake Victoria. The Kagera is a stream 510 mi. long from the source of the Luvironza to its mouth and 70 m. wide near its mouth. Of the other tributaries of Lake Victoria the largest from the point of view of discharge is the Nzoia in the northeast, which has rather less than half the discharge of the Kagera and is torrential, with only a small flow in the dry season; it draws its water from Mount Elgon and the high country to the northeast of Lake Victoria. The lake has an area of about 27,000 sq.mi. inclusive of islands and is like a small sea insomuch as it is subject to considerable storms. The Nile leaves Lake Victoria by the Ripon falls, which are now submerged because of the dam at the Owen falls a mile or more lower down.

At this point the supposed connection between the level of Lake Victoria and sunspots may be mentioned. From 1896 to 1927 maximum and minimum lake levels coincided with maximum and minimum sunspot numbers, thus giving rise to the theory of a connection. Later, however, this regularity disappeared. Moreover on theoretical grounds the connection is unlikely, so the coincidence in the first part of the records must be considered as accidental. Indeed, by the middle of the 20th century no connection between sunspot activity and any portion of the Nile had yet been established. The river below the lake known as the Victoria Nile

FROM A MAP COMPILED BY THE SURVEY OF EGYPT

is first beset with rocks and rapids but becomes navigable just above Namasagali (50 mi. from the lake). Soon it crosses the mouth of Lake Kyoga, the centre of an important district whose products are collected by steamers navigating the lake. Lake Kyoga is a shallow piece of water with many swampy arms, having an area of open water of about 680 sq.mi. (1,760 sq.km.). Many of the arms are practically filled with swamp vegetation, and parts of the open lake are covered with water lilies whose stems go down to the bottom a metre or more below. Below Kyoga the Nile is navigable until it turns westward, after which there is a series of rapids finishing with the Murchison falls. Here the Nile passes through a narrow cleft in the rock and falls a distance of about 140 ft. A short distance from the Murchison falls the Victoria Nile enters Lake Albert. Lake Albert is at the tail end of another river system which starts from near some of the Kagera sources but on the northern side of the Mfumbiro volcanoes. The principal headstream of this system is the Ruchuru river, which runs along the Rift valley northward to Lake Edward. Lake George, which is much smaller, is joined to Lake Edward by a broad channel. The Semliki river, a fair stream, connects Lake Edward with Lake Albert. It flows in places through thick forest along the western side of Ruwenzori, of which it receives the drainage. Lake Albert lies between the high escarpments of the Rift valley, which in places come down abruptly to the water. It has an area of about 2,040 sq.mi. Below Lake Albert the river is known as the Albert Nile or Bahr el Jebel (river of the mountains), by which name it is known in the Sudan. For about 140 mi. the Bahr el Jebel is a placid stream, often with swampy edges abounding in mosquitoes; but at Nimule on the Sudan-Uganda boundary it ceases to be navigable for nearly 100 mi. as it descends from the plateau to the Sudan plains. Just below Nimule are the Fola rapids, a fine sight, where the river rushes through a confined channel between rocks. After its arrival in the plains of the Sudan the country is flat except for rare rocky hills outcropping from the plain. Between Lake Albert and the plains the river receives some tributaries of a torrential nature, of which the principal is the Aswa from the southeast. The principal feature of the Bahr el Jebel when it reaches the plain is the large swamps of the Sudd region, where half its water is lost. Through these swamps the river winds between walls of high vegetation, papyrus, reeds and elephant grass, which except for lagoons and side channels extend from the river to the dry ground on either side, which may be miles away. Very few people are seen when once the river enters the swamps since only occasionally does it touch the higher ground. The country on the edge of the swamps provides good grazing, which lasts into the dry season, as the river, when high, floods a lot of country that is not permanent swamp. Most of the tribes of these southern plains, Nuers, Dinkas and Shilluks, are cattle-owning people living in a very primitive fashion. In the 19th century the Bahr el Jebel was frequently closed by vegetation. A block (Arabic *sudd*) is formed by masses of floating vegetation uprooted from the shallow lagoons by strong winds and blown into the main stream, where they may collect at a bend until they stretch across the whole river. More floating islands of vegetation come down and some get sucked under the surface block to constrict the channel still further. Ultimately the block becomes a solid mass over which even elephants can cross. Sometimes the pressure of the rising water carries it away, sometimes the river breaks away sideways to form a fresh channel. Between 1899 and 1904 the river, which had been completely blocked over long distances, was cleared. Since navigation became regular and frequent these blocks have only very rarely been formed in the main stream, though less-frequented streams are occasionally blocked. About halfway through the swamps a separate channel, known as the Bahr el Zeraf ("river of giraffes"), has been formed near the edge of the dry ground on the east and follows an independent course to the White Nile. In former times it was sometimes connected with the Bahr el Jebel, and a permanent connection has been made by means of two cuts dug by a dredger where the two streams are close together. At the tail end of the swamps the Bahr el Jebel is joined by the Bahr el Ghazal from the west and the two together flow eastward as the White Nile, being joined later by the Zeraf. The Bahr el Ghazal ("river of gazelles") is formed by the junction of a number of torrents coming from the southwest and west. The main stream is the Jur, which is navigable in flood up to a point south of Wau, the capital of the Bahr el Ghazal province. Next to the Jur in size is the Lol, into which a number of tributaries flow. It ends in swamps to the west of the Jur; other streams end in swamp to the east. The effect of the swamps is that very little water flows out of the mouth of the Bahr el Ghazal into the White Nile. In the southern part of the Bahr el Ghazal basin the principal tribe is that of the Azande,

who came originally from the Congo and are agriculturalists and craftsmen.

The Sudd region and country of large permanent swamps ends at the junction of the Bahr el Ghazal and the Bahr el Jebel, although there is some swamp fringing the White Nile nearly as far as the mouth of the Sobat. The Sobat draws the greater part of its water from the Ethiopian plateau, though a little comes from the south. It is formed of two main streams, the Baro flowing from east to west and the Pibor from the south. From the Ethiopian mountains to the White Nile the country is flat grass plain liable to be flooded in the rains and in parts waterless in the dry season. The Sobat is in flood from July to October on its headwaters and, as a result of the inflow from flooded areas, remains high at its mouth until December. It is navigable in flood to Gambela on the Baro and to Pibor Post on the Pibor, but the journey for the greater part is monotonous. The Pibor is occasionally blocked by vegetation. From the Sobat mouth to Khartoum the White Nile is a wide placid stream with a very small slope and often a narrow fringe of swamp. After Jebelein the country gradually becomes more arid and savanna forest gives place to thorn scrub, until near Khartoum it is almost desert. At Kosti the railway from Khartoum that follows the Blue Nile southeastward to Sennar and then turns southwestward on its way to El Obeid crosses the White Nile on a bridge with an opening span. Twenty-five miles from Khartoum is the Jebel Aulia dam, which forms a reservoir the effect of which, when full, extends beyond Renk, 280 mi. upstream.

Between Malakal and Khartoum end the regions of Negro people speaking their own languages—Bantu in the far south and then Sudanic—and begins a region where the people are of mixed Arab and Negro descent and speak Arabic. Actually Arabic is understood by riverside people and people on the main routes all over the southern Sudan, while in Uganda and East Central Africa the *lingua franca* is Swahili.

The Blue Nile.—The Blue Nile is the source of nearly 70% of the Nile flood. The reputed source of the Blue Nile is a spring to the south of Lake Tana in Ethiopia, from which flows the little Abai or Abbai, the principal tributary of the lake. The lake is in a basin at an altitude of about 6,000 ft. (1,840 m.), but with high mountains at no great distance. It has an area of about 1,200 sq.mi. (3,000 sq.km.) and is shallow. The Blue Nile leaves the lake over a series of rapids and very soon drops into a deep gorge in places 4,000 ft. below the general level of the plateau. Tracks descend to the river at places where at low stage there are fords. It is usually a two days' journey with mules to descend, cross the river and climb up the other side of the canyon. Tributary streams have cut similar ravines, and the scenery is magnificent both in its scale and in its ruggedness. The actual course of the river has not been followed as it is not possible to travel along the bottom of the gorge and its course is continually interrupted by rocks and rapids. There is a bridge at Shafartak where the road from Addis Ababa to Gojjam used to cross the river by a ford. Only a small portion of the Blue Nile water comes out of Lake Tana; by far the greater part is from tributaries, some of which are important streams, for example the Bashilo, Jamma, Guder, Didessa, Dabus, Balas, Dinder and Rahad. The water is derived from the rain which falls on the Ethiopian plateau and not from melting snow as has sometimes been stated. The highest mountains in Ethiopia reach 15,000 ft. but snow falls on them only occasionally and quickly disappears.

Halfway between Roseires and Khartoum is the Sennar dam, by means of which an area of 1,000,000 ac. in the Gezira between the Blue and the White Niles is irrigated. The water is impounded in flood and used in February and March. It is a good example of co-operation—originally between the government, a foreign company holding a concession and the native African tenants, then, after the concession had terminated, between the government and the tenants only. The scheme is well planned, and irrigation is based on careful measurement by weirs and other devices of the quantities of water entering the feeders from the main canal. The principal crops are cotton, millet and *lubia* (a kind of bean). Between Sennar and Khartoum the Blue Nile receives two tributaries: the Dinder and the Rahad. These, like the Blue Nile, are torrential but unlike the Blue Nile, dry up entirely except for pools (though both are considerable streams in flood).

The Main Nile and the Atbara.—The main Nile from Khartoum northward flows between deserts with a narrow strip of vegetation on either side. Where the soil permits, the banks and neighbouring flat land are cultivated by the use of Nile water and support a small population. These conditions continue as far as a little distance north of Aswan. In this stretch the Nile receives its last tributary, the Atbara, which in flood is a large muddy river and in the dry season is a string of pools. Its principal tributaries are the Setit or Takazze (Takkaze) and the Bahr es Salaam. From Abu Hamed onward the valley is often rocky and desolate, particularly in the neighbourhood of the Fourth cataract and for more than 100 mi. S. of Wadi Halfa, where the country is known as the Batn el-Hagar (belly of stones). Wadi Halfa is just below the Second cataract and is within the area affected by the heightened Aswan reservoir, which ponds water up as far back as the cataract. The Aswan dam, which has been heightened twice, now has a height of nearly 40 m. (130 ft.) and a length of 2 km. ($1\frac{1}{4}$ mi.) and stores 5,300,000,000 tons of water.

From Aswan northward to Cairo the river is bordered by a flood plain of alluvium gradually increasing to a maximum width of about 12 mi. which is cultivated by irrigation. Outside this is the desert. At the beginning of the 20th century basin irrigation was practised up to the head of the delta. In this system the land is watered by short canals, which can only receive water when the river is in flood. These deliver the muddy water on to the land, which is divided into compartments or basins by cross banks running from the river bank to the higher desert edge. The water is held in these basins to a depth of several feet for some weeks and deposits its mud. During this time the land is well soaked, the river falls, and the remaining water is then returned. After this seeds are planted in the mud to produce the single annual crop, which gets only such extra water as can be lifted from wells. This system was in use for thousands of years without any deterioration of the soil; but with an uncontrolled river the area that could be watered was variable and liable to be reduced in a low flood, with the possibility of famine. In perennial irrigation as distinguished from flood irrigation much smaller quantities of water are run on to the land every two or three weeks and two or three crops are grown in the year. This began to develop on a large scale from canals in the time of Mohammed Ali Pasha, toward the middle of the 18th century. A necessary feature is the barrages or low dams which have been built across the Nile at various points to enable its level to be raised so that it can flow at all times into main canals, whose heads are just above the barrages. From the main canals there are branch canals, and these again divide into smaller canals called distributaries, which deliver the water to irrigation ditches and so to the land. By the end of the 19th century cultivation in the delta itself was all perennial, depending on the Mohammed Ali barrage (below Cairo at the head of the delta), above which the three main canals of Lower Egypt begin. During the 20th century barrages were built at Asyut and Nag Hammadi in Upper Egypt, by means of which a large part of Upper Egypt was converted to the perennial system; and another barrage at Esna improved basin irrigation. During the time of low supply, when all the water is needed for irrigation, the Rosetta branch is closed at the barrage and the Damietta branch nearly so, while both are completely closed near the sea—the first by the Edfina barrage with its sluices, the second by an earth bank built each year by February and washed away by the rising flood in August (during this time waterborne traffic in the delta follows the canals). The crops grown during the low stage of the river are cotton, rice, sugar cane, groundnuts, sesame and millet. In the flood season the principal crop is maize; and in the winter the crops are wheat, barley, clover, beans, flax, onions and lentils. Cotton is the most valuable crop and occupies more than one-quarter of the total cultivated area. It is also Egypt's principal export. The Nile from Aswan to the sea is controlled in the interests of irrigation, though control is not complete in flood time.

Climate and Health.—In Egypt the months May to October are hot in the daytime, but there is a considerable drop in temperature after sunset. The winter months usually have clear bright days with cool or even cold nights. The climate of the northern Sudan is similar except that the temperatures are higher. Upper Egypt and the northern Sudan are characterized by low humidities, and the region from Halfa to Atbara is one of the driest in the world. In the central Sudan from Khartoum to Renk or Roseires during the months of December, January and February the days are not unduly hot, and the nights are cool, while at the same time the humidity is low; then the temperature increases until May or June, after which the onset of the rains causes it to drop; September and October are liable to be oppressive months. In the southern Sudan the average temperature is lower than further north and varies less through the year; the highest temperatures occur from January to April and the lowest are in July and August. The climate of the high country of Ethiopia and central Africa is temperate, and above 5,000 ft. the nights are cold. Round Lake Victoria the temperature does not vary very much through the year.

The principal features of the rainfall are as follows. (1) There is a little rain on the Mediterranean coast (from 150 to 200 mm. annually) and over the delta, but this decreases rapidly with distance from the sea, being only 30 mm. in Cairo; it falls usually in the months from November to March. (2) A region extending from just south of Cairo to just north of Atbara is practically rainless. (3) There is next a steady increase of rainfall southward of the rainless region. (4) Regions of fairly heavy rainfall are found on the Ethiopian and Lake plateaus, where a total of more than 1,600 mm. is reached in places, the average rainfall of both plateaus being about 1,200 mm. or 50 in. On the whole the rainfall of the Nile basin is scanty, and hence for the size of its basin the discharge of the Nile is small. From Khartoum southward over the Sudan plain and in Ethiopia the maximum of rainfall is in July and August, but the rainy season is increasingly long toward the south and as the altitude of the country increases. On the Lake plateau there is no month when rain may not fall. There are two minima and maxima, the minima being in January and June-July.

In order to keep in good health in the Nile basin it is necessary to take precautions against diseases and, in the case of visitors and foreign residents, particularly against those prevalent in hot countries. In the southern and central parts of the basin malaria is a common disease and is carried by anopheline mosquitoes. All over the basin dysentery and typhoid fevers are common. The parasites which cause these are usually taken in food, while water and flies are also a means of carrying the infection. In Egypt and some other parts of the basin bilharziasis and ankylostomiasis, diseases due to microscopic worms, are common. They are either contracted by drinking infected water or by wading or bathing in it. In certain districts relapsing fever occurs, transmitted by the bite of a tick that lives in cracks in the ground and in native houses and comes out at night. Sleeping sickness occurs over a wide area of the southern Nile basin and was formerly responsible for the deaths of great numbers of people. Now, however, as a result of stringent measures of control, it has practically disappeared from many districts in which it was formerly a serious danger. It is carried from one person to another by the bites of species of tsetse flies. Flies of the same genus carry trypanosomiasis of animals and so cause mortality among cattle, horses and donkeys.

Vegetation.—The desert region outside the Nile valley extends from the Mediterranean to about the latitude of Atbara. Much of this area is almost rainless, and there is no vegetation except in favoured places such as the oases, where underground water comes to the surface, or along drainage lines where after rain the subsoil may remain moist for a long period. As regions of scanty but regular rainfall are reached, the country becomes dotted with small thorny shrubs, mostly acacias. These begin about the latitude of Atbara and grow increasingly thick toward the south. After rain the country becomes green with grasses and small herbs but these rapidly dry up after the rain ceases.

South of this are types of savanna country. The first is thorny savanna containing small thorny trees and after the rains grass and herbs. This covers much of the central Sudan from latitude 10° to 15° N.

South of this is found true savanna country, consisting of open grass plains on which trees are rare except in a few places near the rivers, and on which the grass may grow from 6 to 10 ft. high. During the rains these plains are often swampy. True savanna covers a good deal of country from Malakal to Bor and from the Bahr el Jebel to the foothills of the Ethiopian plateau. During the dry season, which lasts about half the year, the grass dries, and over all the southern Sudan and parts of the Lake plateau it is burned every year. This kills many species of trees and so limits the vegetation and moreover stunts the growth of the remainder. In the savanna zone the rivers are often fringed with reed swamp, more particularly the Bahr el Jebel in the Sudd region from Lake No to Bor and also the lower Bahr el Ghazal. In this swamp grow papyrus, bulrushes, tall bamboolike grasses, "um soof" (*Vossia cuspidata*), the thorny tree called "ambatch" (*Herminiera elaphroxylon*), whose wood is like pith, and floating vegetation such as the water lettuce (*Pistia stratiotes*). Papyrus swamps are also found in the valleys of the Lake plateau.

The true savanna country changes into savanna forest, which fringes the Blue Nile near Roseires and southward and covers the western slopes and parts of the plateau of Ethiopia, the southern parts of the Bahr el Ghazal basin and large areas of Uganda, the Lake plateau and its slopes. Savanna forest consists of trees of medium height casting little shade, while the ground is covered with grass and perennial herbs. Tropical rain forest does not exist in great quantity in the Nile basin, but it is found in river valleys along the Nile-Congo divide and in patches on the Lake plateau and in Ethiopia. Rain forest is characterized by a large number of species and several stories of vegetation, so that practically all the space is utilized and a wonderful luxuriance of plant life results.

History of Exploration.—The earliest traces of man are stone implements found in many parts of the basin, some of which were made perhaps 100,000 years ago. The most recent in Egypt are found with early pottery and come down to *c.* 4,500 B.C. The historical period begins *c.* 3,400 B.C. and follows a period known as predynastic in which metal instruments began to be used as well as those of stone. When the early flint-implement people lived, the climate of North Africa was warm and humid. Lakes and rivers existed in what is now desert and the country was covered with vegetation and inhabited by animals now only found in tropical Africa. The mildness of the climate allowed men to live in shelters made of reeds or branches and did not force them to live in caves, as in northern countries, where traces of their occupation would have been preserved. Consequently the only remains of these early men are their durable flint instruments which are widespread over northeastern Africa. Gradually the climate became drier, the rivers shrank and ultimately, perhaps 20,000 years ago, desert conditions were established as they are at present. The result of this change was to concentrate people on the edges of the Nile valley. In the valley itself the river probably covered most of the land when in flood and left huge marshes when it fell again and retired to its trough. In these marshes primitive people living on the edges of the valley hunted hippopotami, water-loving antelopes and wild fowl. As the rainfall over North Africa decreased and the country became arid, the Nile shrank to something like its present volume, and the beginnings of agriculture probably started on the edges of the valley.

Actual history in the basin begins in Egypt 5,000 or 6,000 years ago and is based on deductions from pottery and utensils found in tombs. Later there are the inscriptions, pictures and carvings on the monuments which record contemporary events, and so down through ancient Egyptian, Greek, Roman and Arab times to the present. Little is known of the early history of the Nile basin outside Egypt and this comes from the excavations in the northern Sudan and occasional references on Egyptian monuments to people farther south. It seems likely that the ancient Egyptians, although they traded down the Red sea as far as Somaliland and up the Nile beyond Khartoum, knew nothing of the source of the river. Herodotus, who visited Egypt *c.* 460 B.C. and travelled up

to Aswan, has left some account of the country and a little about what lay to the south as far perhaps as the beginning of the Sudd region. Eratosthenes, one of the mathematicians and geographers of the Alexandrian school in the 3rd century B.C., says that the Nile is formed by three streams, two of which issue from lakes in the east and the third from some lakes to the south. By the 1st century A.D. trade down the Red sea to India and the east coast of Africa was well established, and this must have led to trade with the interior. It was probably due to this that rumours of snow-capped mountains and great lakes in the interior reached the Mediterranean. Because of the difficulties of travel in the Sudan it seems unlikely that the connection of the Nile with these was actually established; it was probably an intelligent guess. Strabo about the beginning of the era says that it was well known that the annual rise of the Nile was due to rain on the high mountains of Ethiopia. Claudius Ptolemaeus, who lived in Alexandria in the 2nd century A.D. and wrote treatises on astronomy and geography, thought that the White Nile came from the high snow-covered mountains in central Africa, called the Mountains of the Moon, and passed through two lakes. His map corresponds in a general way with what actually exists and must have been a collation of information then current as travellers' tales.

With Portuguese expeditions to Ethiopia in the 15th and 16th centuries more definite knowledge was obtained, and the first European to see the source of the Blue Nile was Father Pedro Paez, a Portuguese Jesuit, who visited it in 1613. Later, about 1770, James Bruce spent some time near Lake Tana and the head waters of the Blue Nile and then returned from Gondar to the Blue Nile at Sennar and so down the Nile to Cairo.

Modern exploration of the Nile basin begins with the conquest of the northern and central Sudan by Mohammed Ali Pasha and his sons from 1821 onward. As a result of this the Blue Nile was known as far as its exit from the Ethiopian foothills, and the White Nile as far as the Sobat mouth. During his last visit to the Sudan about 1837 Mohammed Ali gave orders for the exploration of the White Nile so as to solve the problem of its origin, which had interested the civilized world for 2,000 years. Three expeditions under a Turkish officer, Selim Bimbashi, were made between 1839 and 1842 and two got to the point about 20 mi. beyond the present port of Juba, where the country rises, and rapids make navigation very difficult. These expeditions were accompanied by Georges Thibaut (Shawki Ibrāhim), Jacques Pons d'Arnaud (Arnaud Bey) and Ferdinand Werne who published accounts of their journeys. After these expeditions traders and missionaries penetrated the country and established stations in the southern Sudan. From an Austrian missionary, Ignaz Knoblecher, in 1850 came reports of lakes farther south. In the 1840s the missionaries Johann Ludwig Krapf, Johannes Rebmann and J. Erhardt travelling in East Africa saw the snow-topped mountains Kilimanjaro and Kenya and heard from traders of a great inland sea which might be a lake or lakes.

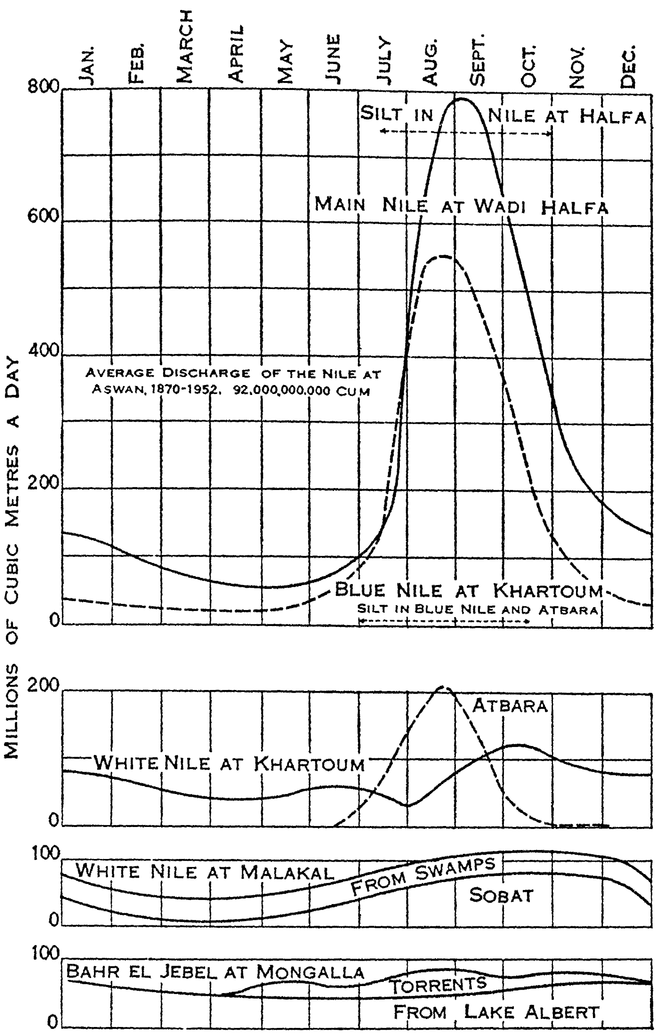
These reports led to fresh interest in the Nile source and to an expedition by Richard Burton and J. H. Speke, who followed a trade route of the Arabs from the east coast and reached Lake Tanganyika. On the return journey Speke went north and reached the southern end of Lake Victoria, which he thought might be the origin of the Nile. This was followed in 1860 by another expedition by Speke and J. A. Grant under the auspices of the Royal Geographical society. They followed the previous route to Tabora and then turned toward Karagwe, the country west of Lake Victoria. Here they saw the high Mfumbiro mountains 100 mi. to the west (they thought that they might be the Mountains of the Moon) and discovered the Kagera river. From the information that he was able to collect Speke thought that the Kagera must be the principal tributary of the lake. Continuing around the lake he finally reached the Ripon falls (1862), at which point he wrote "I saw that old Father Nile without any doubt rises in Victoria Nyanza." Speke then made his way northward with Grant, for part of the way along the Nile, until they reached Gondokoro, nearly opposite the present Juba. They heard rumours on the way of another large lake to the west but were unable to visit it and passed the information on to Sir Samuel Baker, who met them at Gondokoro, having come up from Cairo. Baker then continued his journey south and discovered Lake Albert. Neither Speke nor Baker had followed the Nile completely from the Ripon falls to Gondokoro, and Baker, who saw the northern half of Lake Albert, was told that it extended a very long way to the south. The discoveries of Speke and Baker are now commonly held to have settled the origin and course of the Nile, but at the time the unexplored gaps and the very elementary state of the science of hydrology led people to think that there was still an element of doubt. The question was settled when, between 1874 and 1877, Gen. C. G. Gordon and his officers followed the river and mapped part of it. In particular Lake Albert was mapped and Col. Charles Chaillé-Long, an American, discovered Lake Kyoga. In 1875 H. M. Stanley travelled up from the east coast and circumnavigated Lake Victoria. His attempt to get to Lake Albert was not successful, though he travelled up the Katonga swamps and got as far as the escarpment above Lake George, from which he was forced to turn back by threat of war. Finally he marched to Lake Tanganyika and travelled down the Congo to the sea. In another memorable journey in 1889 to relieve Emin Pasha, Stanley travelled up the Congo and across to Lake Albert, where he met Emin and persuaded him to evacuate his Equatorial province, which had been invaded by the Khalifa's forces. They returned to the east coast by way of the Semliki valley and Lake Edward, and Stanley saw the snowy peaks of Ruwenzori for the first time.

Thus by 1890 the main features of the Nile basin were known, though there still remained much to be explored and also the business of map-making, which 60 years later was still not fully complete in detail. The penetration of central Africa by British and German settlers from the east coast and the establishment of settled conditions in the Sudan led to detailed exploration by district officers and to the creation of survey departments, which began systematically to map the region. Since 1900 the expansion of perennial irrigation in Egypt and its commencement in the Sudan have created demands for more water when the river is low. These have led to hydrological studies and surveys, whose results are described below.

Hydrology.—Nile studies may be said to have begun at a very early date, as the ancient Egyptians recorded river levels on Nilometers some of which still remain. However, before the 20th century there was very little detailed knowledge about the Nile water supply and its origin, and the greatest developments took place after World War I. The levels and discharges of the principal tributaries and of the main stream are now measured at many points from the Kagera, beyond Lake Victoria, to the sea, with the exception of the Blue Nile beyond the Sudan boundary. Before the 20th century, discharges of the Nile were obtained by the use of surface floats, but in 1901 current meters were first used to measure velocity, leading to much more accurate results. For the first time the discharges of the three main tributaries, the Blue and White Niles and the Atbara, were accurately measured and their relative importance discovered. After the Aswan dam was finished a large tank was built below it, which was used to measure the discharge of a sluice under different heads and openings. By comparing one kind of sluice with another it was found possible to deduce the discharge of the river, which was thus based on a measure of volume. The measurements by current meters and sluices, carried on for many years, agree closely. Between 1901 and 1904 Sir William Garstin made a hydrological reconnaissance of the White Nile from Lake Victoria to Khartoum, and C. E. Dupuis examined the Atbara and also the Rahad and the Dinder (tributaries of the Blue Nile) and visited Lake Tana. The results of these reconnaissances, with recommendations for the improvement of Egypt's water supply, were published in 1904 in a report on the basin of the upper Nile. In 1906 Sir Henry Lyons published his *Physiography of the Nile Basin*, in which was collected all the information from travellers and scientific explorers available at the time. In the previous year the Sudan branch of the Egyptian Irrigation service had been formed, which with the Physical department was to continue studies of the upper Nile. In 1925 the Sudan formed an Irrigation service, and in 1947 Uganda started a hydrological survey.

The principal feature of the Nile regime is the annual flood.

The river at Wadi Halfa, where it enters Egypt, usually begins to rise in June, reaches its maximum at the beginning of September and then falls away at a decreasing rate. It is low from February to the middle of July, and during this time its natural supply is insufficient for the irrigation requirements of Egypt. Although the flood is a fairly regular phenomenon it varies both in volume and in date. These variations are important, since a very high flood brings danger of flooding in Egypt and the northern Sudan, and a low one may mean a shortage of irrigation water later.



FROM MINISTRY OF PUBLIC WORKS, EGYPT

AVERAGE DISCHARGES OF THE NILE

The flood is caused by the Blue Nile and Atbara, whose water comes from rainfall on the Ethiopian highlands and brings down mud washed off the land surface into the many small streams which it forms. The Blue Nile and Atbara come down in flushes, which are gradually smoothed as they travel down the river. The average flows of the river and its principal tributaries are shown in the accompanying figure. It is clear that the greatest part of the total flow is contributed by the Blue Nile and the least by the Atbara, but at the low time of the year the White Nile is the most important stream. The White Nile also receives some water from the Ethiopian highlands, which altogether produce 84% of the Nile supply while the remaining 16% comes from the Lake plateau of central Africa. When the Blue Nile is rising rapidly it holds up the White Nile discharge, and only when the rise slows down does the White Nile's discharge begin to increase. The effect of the Blue Nile is therefore to make a natural reservoir of the White Nile, and this effect is now produced artificially on a greater scale by the Jebel Aulia dam, situated some little distance up the White Nile. The dam raises the river level to beyond Renk, a distance of 280 mi., and adds 2,000,000,000 cu.m. to Egypt's low-stage supply. The Atbara draws its supply from the northern part of the Ethiopian plateau, but little is known of the hydrology of its tributaries. The rainfall that causes its flood comes from the same source as that falling in the Blue Nile basin, and this is probably the South Atlantic (*see* below). In flood its level fluctuates rapidly like that of the Blue Nile, and after the flood it soon ceases to flow. The Blue Nile receives two tributaries in the Sudan, both coming from Ethiopia, the Rahad and the Dinder. They are strong streams in flood but, like the Atbara, are reduced to pools later. When at their maximum, they produce together about 10% of the Blue Nile's discharge. Of the tributaries of the Blue Nile outside the Sudan practically nothing is known from a hydrological point of view. Lake Tana has been studied and only produces about 7% of the discharge of the Blue Nile. The lake is important because it offers the possibility of an economical reservoir for the joint use of the Sudan and Egypt, where excess evaporation losses would be small.

About half of the discharge of the White Nile is provided by the Sobat, about half by the Bahr el Jebel and an insignificant portion by the Bahr el Ghazal. The Sobat is formed by two main streams, the Baro coming from Ethiopia and the Pibor coming from the south, though its main tributaries also come from Ethiopia. Flushes occur on the headstreams of the Sobat, but when they reach the plains they overflow and flood large areas of country. The effect of this is to smooth out all the peaks and to delay the arrival of the maximum at the mouth by a couple of months. The Sobat, like the Blue Nile and Atbara in flood time, brings down mud from Ethiopia, though only a small amount gets into the main Nile. The figure shows the average contributions of the Sobat and Bahr el Jebel (called Swamps) to the White Nile. It will be noticed that the Bahr el Jebel's discharge varies very little throughout the year. This is due to the regulating effect of the large swamps of the Sudd region on the Bahr el Jebel. When a rise occurs upstream of the swamps, most of it flows out of the river into the marshes and only a very small part of the increase is left at their tail. As large areas are below the river level, the water which enters them is lost by evaporation and by transpiration from the luxuriant vegetation, with the result that the Bahr el Jebel loses nearly half its water in the swamps. In the case of the Bahr el Ghazal, which drains a large area having a fair rainfall, the tributary streams in their upper courses carry considerable volumes of water in flood (from July to October) although they are practically dry from January to April. Of this quantity which drains into the tributaries, estimated to be rather more than the discharge of the Sobat, only a trickle reaches the mouth of the Bahr el Ghazal. The Bahr el Jebel derives its water mainly from the equatorial lakes, but there is in addition a contribution averaging about 17% of the total from torrential tributaries joining between Lake Albert and Mongalla, which rise and fall quickly. During the dry season their contribution is negligible. The Bahr el Jebel immediately below Lake Albert does not fluctuate rapidly, since it is entirely controlled by the lake, which because of its size can only change its level slowly. Lake Albert receives supplies from two main sources, the Victoria Nile and the Semliki. The latter comes from Lake Edward and receives on its way the drainage from the western side of Ruwenzori and some small streams from the Belgian Congo. The Victoria Nile comes from Lake Victoria through Lake Kyoga and provides about 80% of the inflow into Lake Albert. There is a small amount of drainage from swampy valleys into the Victoria Nile and Lake Kyoga, which in seasons of heavy rain may be considerable; but on the average the system is a source of loss.

Lake Victoria has an annual average outflow of 21,000,000,000 cu.m. A water balance sheet for the lake shows that rainfall and evaporation are approximately equal and about five times the outflow by the Victoria Nile or inflow from tributaries. The approximate equality of rainfall and evaporation makes the large lakes of central Africa valuable as potential storage reservoirs. Lake Victoria has been made into a reservoir by the Owen Falls dam on the Victoria Nile, just below its outfall from the lake. In this the surplus discharges of high years can be stored to meet the deficit of low ones. It was planned moreover to use the head for a hydro-

electric scheme to provide power for industries in Uganda.

Origin of the Nile Flood.—It has already been said that the greater part of the Nile water comes from rainfall in Ethiopia. The development of meteorology in the 20th century made it clear that the causes of such phenomena as the Indian monsoon and other tropical rains must be sought in the general circulation of the atmosphere. In 1910 J. I. Craig put forward the theory that the Ethiopian rainfall is caused by a current of moist air coming from the South Atlantic across Africa. The following is the evidence. The possible sources of rain in Abyssinia are the Mediterranean sea, the Red sea, the Indian ocean and the South Atlantic ocean. The Mediterranean and Red seas are ruled out because of intervening deserts and the fact that there is no stream large enough to reach the sea on the eastern side of the highlands. On the whole the winds of the rainy season blow across Africa from the Gulf of Guinea to Ethiopia. The rainfall is heaviest over the coast and the Congo basin, falls off over the Sudan plains and is again fairly heavy on the Ethiopian plateau. South and east of the plateau, rainfall is scanty and large areas are desert or semi-desert.

Periodicity and Prediction.—Much work has been devoted to the search for periodicities in natural phenomena and the long series of records of the Roda (Cairo) Nilometer have afforded valuable material. The most complete portion extends, with gaps, from A.D. 622 to A.D. 1522 and gives maximum and minimum levels. In spite of uncertainties due to repairs and renewals of the gauge, to changes of the river channel, to vagaries of gauge observers and to defects in the records, much useful information can be extracted from them. When the maximum levels are plotted in order the principal feature is the occurrence of terms of years when, on the whole, floods are above the average and of others when they are below; but there is no obvious regularity about their occurrence. Low floods may occur among high ones and vice versa. For example in the latter half of the 19th century a very low and a very high flood occurred in successive years, with a difference at Aswan of 9 ft. between their peaks. Many people have analyzed the records, and periodicities have been found varying from 2 to 240 years in length, but all of them have small amplitudes of the order of 10 cm. The largest so far found has an amplitude of 17 cm., or 34 cm. between minimum and maximum floods. These periodicities are completely masked by irregularities such as the one already mentioned and, although they may have theoretical importance, are of no use for the practical business of attempting to forecast the flood. Forecasts of the river, when they can be made, are of considerable value in the practice of irrigation. Attempts to relate the flood discharge to the general circulation of the atmosphere have been partially successful, and relations have been found between the volume of the flood and temperatures in Alaska and Samoa, and the pressure at Port Darwin in Australia. On these a formula can be based which will account for rather less than half the variation of the flood; the rest results from causes outside the formula. By the middle of the 20th century this was about as far as such statistical research could go. If the flood could be traced to two or three causes which could be measured, a fairly exact formula could be deduced. So far, however, only symptoms of such causes had been found.

Two other types of forecast are successful and in regular use. The first depends on the time taken by rises or falls of the river to travel downstream and on the flattening that they undergo as they proceed. Past records of river levels have been analyzed, and from this analysis curves and tables have been made showing how long a well-marked change of level takes to travel over the various reaches of the river and how much is lost on the way. This varies with the height of the river. For example the time from Roseires on the Blue Nile to Aswan, a distance of 1,540 mi., varies from 10 days at the top of the flood to 35 days at the lowest levels. This type of forecast is very useful when the Blue Nile and Atbara begin to rise, and plans must be made for the sowing of crops. The amount of these depends on the amount of available water, of which some must be retained in the Aswan reservoir so that it is not empty before the natural supply of the rising river is sufficient for the crops. If the flood is a high one, this type of forecast is again useful to predict the height to which the river is likely to rise in Lower Egypt, so that suitable measures can be taken to prevent breaches of the river banks. The other successful type of forecast is based on the fact that when the rains in Ethiopia are over, usually by the end of October, the Blue Nile falls regularly in much the same manner each year. Consequently the discharge in one month influences those in the following months. Something of the same sort applies to the White Nile. By tabulating the sequences of past years a forecast can be made in November for the following months up to May or even June. This forecast improves as time goes on, and a better one can be made in December than in November and so on. It is extremely useful as it gives an idea of the water which will be available for summer crops and whether the prospects are favourable for a large area under rice.

Utilization of the Water and Irrigation Projects.—In Egypt in 1950 about 5,750,000 ac. were cultivated by irrigation, of which 1,000,000 were on the basin system of flood irrigation. In the Sudan about 1,000,000 ac. were irrigated in the Gezira by water taken into a canal just above the Sennar dam; about 300,000 ac. were irrigated by pumps drawing from the river; and an area in the Northern province, varying from 10,000 ac. in poor years to 100,000 in good ones, was watered by flooding. Elsewhere in the basin of the Nile cultivation by irrigation is practically non-existent.

The division of water between Egypt and the Sudan was the subject of the Nile Waters agreement of 1929 between Great Britain and Egypt. This defined the amount of water that could be taken by the Sudan without interference with the amount used by Egypt in the past; if more water was to be taken for the Sudan, Egypt's preliminary consent was to be obtained. Egypt moreover was not to undertake conservation works without first agreeing on measures to safeguard the interests of the Sudan. Subsequent agreements were made for Egypt to build the Jebel Aulia dam (1932) and a dam at the Fourth cataract (1952), that the amount stored in the Sennar reservoir might be increased and that Egypt and the Sudan should share equally in the cost and benefit of the project for a dam at Lake Tana.

The irrigation year may be divided into two parts, which are roughly from August to January when the river supply is in excess of requirements, and from February to July when it is necessary to add to the natural flow of the river by water stored from the previous time of excess. The storage of water in the Jebel Aulia reservoir begins in August when there is definitely an excess in Egypt. This is White Nile water, which is free from silt, and it is used for irrigation in Egypt as soon as the natural river is insufficient. The Sennar dam is in use from the middle of July to the end of March. Its reservoir is first of all filled to the level required to supply the Gezira canal and later to full storage level. During February and March the canal takes only water previously stored in the reservoir, since at this time Egypt has a right to all the natural flow. Further water is stored for Egypt in the Aswan reservoir from October, and this is drawn upon after the supply from the Jebel Aulia reservoir is exhausted. At the height of the flood the silt content of Nile water averages about 2,500 parts per 1,000,000 by weight, and for the whole flood period from July to October about 1,600 parts per 1,000,000. This is much less than is carried by many other rivers, for example the Colorado, the Missouri and the Indus. Most of this has passed by the time that the Aswan reservoir begins to be filled. It occasionally happens, however, that the reservoir is partially filled at the top of a high flood to reduce the maximum levels in Egypt. So far only an insignificant amount of mud has been deposited in the reservoir by this procedure. Nile water contains on the average about 170 parts per 1,000,000 of dissolved salts. This is not a great amount and is only about half that in the Thames, but more than in many other British rivers.

By the middle of the 20th century the rapidly increasing populations in Egypt and the Sudan had made further conservation works on the Nile urgent. Proposals for these were made in 1946 in *The Nile Basin*, vol. vii, by H. E. Hurst, R. P. Black and Y. M. Simaika and were accepted as the policy of the Egyptian government in 1949. They involved as a main principle over-year storage, the theory of which was worked out by Hurst (*Trans. American Society of Civil Engineers*, Paper 2447 [1951]). Over-year storage was essential, since in 1913–14, for instance, the whole discharge of the river had been less than the requirements of Egypt and the Sudan were in the middle of the 20th century. The projects comprised, in the first place, a large reservoir in Lake Victoria, produced by the Owen Falls dam, which would form the main reservoir for over-year storage and would also provide hydro-electric power for use in Uganda; by means of this reservoir water would be stored in good years to supplement the supply of bad ones. An adjunct to this reservoir was to be a regulator or low dam near the outlet of Lake Kyoga; by keeping this partially filled an increased

discharge from Lake Victoria could be passed on immediately (instead of gradually as Lake Kyoga filled to the required level), thus avoiding a delay of two or three months. Thirdly, a reservoir in Lake Albert was required to control (1) both water from the Semliki river and the large quantity coming in seasons of unusually heavy rainfall from the tributaries of Lake Kyoga and (2) the amount of water sent down to the Sudan and Egypt. Fourthly, in view of the losses of water in the swamps of the Bahr el Jebel, as it was obviously useless to provide large storage reservoirs if half their outflow would be lost, the Jonglei diversion canal was designed to by-pass the swamps; this would leave the Bahr el Jebel at Jonglei below Bor and join the White Nile between the mouths of the Bahr el Zeraf and the Sobat; a regulator would divert about half the discharge down this canal, and the remainder would flow down the Bahr el Jebel at a level that would reduce the losses to normal, so that there would be a gain of water in addition to the regulated distribution produced by the Lake reservoirs. The Jebel Aulia reservoir was to continue to act as it already did and to store water mainly from the Sobat flood. Fifthly, a projected dam at the outlet of Lake Tana, if the lake could be used to its full capacity, would provide water for the increase of cultivation in the Sudan, a measure of over-year storage and also a reserve in case of emergency in Egypt, such as might be caused by a very low flood. Finally a large dam on the main Nile below the Atbara would provide a reservoir for flood protection with, in addition, some stored water from all floods except the low ones, for use in the following low stage.

These projects could only be carried out after agreements between Egypt, the Sudan, Ethiopia, the Belgian Congo and the East African territories. Work on the Owen Falls dam was begun in 1949, and Egypt and the Sudan agreed on the building of a large dam in the Fourth cataract. Moreover the Sudan undertook a far-reaching investigation into the effects of the Equatorial Nile projects on the country and its people.

Since the above-mentioned proposals were accepted, a project for a reservoir in the Wadi Rayan, a depression in the desert south of the Fayum, was restudied. This would give a measure of flood protection and store some additional water from the flood. A proposal for a very high dam above the present Aswan dam was being studied in 1953. It was appreciated that, if this could be realized, it would produce a reservoir capable of performing some over-year storage on the main Nile and also of producing large quantities of hydroelectric power, by means of which Egypt might develop industry on a large scale. It would create a reservoir which at its maximum level would extend 90 mi. south of Wadi Halfa. The proposal was revolutionary in its departure from previous ideas and raised many difficulties which needed a considerable amount of detailed study, for which in part the material was yet to be collected. The Sudan government meanwhile was studying a project for a dam upstream of Roseires to store water from the flood so that cultivation on the Blue Nile could be increased. A hydroelectric scheme had already been undertaken at the existing Aswan dam. Any of the dams already mentioned offered possible sites for the development of power, but a drawback in some cases was the distance between the places where the power could be produced and those where it could be usefully employed. In the case of a reservoir filled and emptied annually, as were the existing reservoirs except that in Lake Victoria, there was the disadvantage that the available power fell to a small quantity during the time that the reservoir was empty.

NILE, BATTLE OF THE. The battle of the Nile was fought in Aboukir Bay, near Alexandria, on Aug. 1, 1798. It arose out of Napoleon's famous Egyptian Expedition, the first news of which had reached Jervis, off Cadiz, earlier in the year, in the shape of rumours of great activity in the port of Toulon. In the previous year the first European coalition against revolutionary France had been finally dissolved by the elimination of Austria, the result being that in 1798 France was at war with England only, and this eastern expedition with its proposed, though unlikely, result of an attack on India, was considered by Napoleon to be the most hopeful means of embarrassing England, while at the same time keeping himself in the limelight. As soon as Jervis heard of the preparations at Toulon, the object of which was, of course, unknown to him, he despatched Nelson with a small force to reconnoitre, and soon afterwards he had an opportunity of reinforcing him. Pitt was trying to build a new coalition against France, and was approaching Austria who made England's re-entry into the Mediterranean, which she had been forced to evacuate, a condition of acceptance. Jervis was thus ordered to send a detachment through the Straits of Gibraltar with instructions to find out whether a re-entry into the Mediterranean was feasible; what he did was to reinforce Nelson so as to bring his strength up to 14 ships, 13 of them seventy-fours and one a fifty.

Before Nelson was joined by his reinforcements and while he commanded only three seventy-fours and some frigates, he was forced from his station, off Toulon, by a gale. He suffered severely in this and—perhaps worst misfortune of all—was separated from his frigates which went to Gibraltar in the expectation that the admiral would go there to refit. The absence of "the eyes of the fleet" during the ensuing search for the French was obviously a great handicap. The remaining ships were repaired somehow and by May 31 they were back off Toulon, having been absent ten days, but the French were gone. The direction of the wind led Nelson to believe that the kingdom of the two Sicilies was the danger-point, and that the French had not made for the Straits of Gibraltar as it was believed in England they would. Consequently he made for the Bay of Naples, and on June 7 was joined by the reinforcements from Jervis. Malta was the next point at which it was decided to aim, but, while the fleet was in the neighbourhood of Cape Passaro, news reached it that the island had fallen to the French. It was this news that shook the public confidence, generally so strong, in Nelson, and for a time it was considered that he was being out-manoeuvred. The problem before him was certainly a hard one. With the intuition, however, for which he was so famous, he decided on Egypt as Napoleon's next stopping-place, and made sail for Alexandria. He found it empty and impetuously left, on June 30, to search elsewhere. On the following day the French arrived, actually sighting the topsails of the last ships of the departing English fleet, which ranged the coast of Asia Minor in its search and finally arrived at Syracuse. Here, by the kind influence of Lady Hamilton with the Neapolitan court, the fleet was entirely revictualled and immediately sailed again for the East. After further searching, Nelson decided to try Alexandria once more, and this time was rewarded by the sight of the republican tricolour floating over the town. A little later the French fleet could be seen anchored in Aboukir Bay. The long search was ended.

Aboukir Bay is situated about fifteen miles north-east of Alexandria and is about fifteen miles wide, extending from Aboukir Point on its westerly side to the Rosetta mouth of the Nile. The bay was silted up and its western curve offered exactly the sort of refuge de Brueys, the French Admiral, was seeking for the protection of his fleet which consisted of nine seventy-fours, three eighties, "L'Orient" of 120 guns, and four frigates. He had hoped to station this fleet in such a manner that it would be impossible for an attacking enemy to do more than fight him from seawards. The curving shoals seemed to offer him such a position, and he had drawn up his fleet facing north and north-west in a very obtuse angle, with his own ship, "L'Orient," at the apex, and the ships at the extremities of the line close to the shallows. The frigates he placed between this line and the shoals. So certain was de Brueys that this arrangement would prevent the British getting between him and the land that his ships were not even prepared for action on the landward side. An ordinary attack on his seaward side would, he thought, favour him, since the enemy would be under sail and, further, he had prepared batteries ashore which would enfilade their position. To Nelson's experienced eye, however, a weakness in these dispositions was at once apparent. The French ships were anchored in such a manner that there was nothing to prevent them swinging, and, as Nelson himself put it, "where there is room for a Frenchman to swing, there is room for a Briton to anchor"; in other words it would, for all de Brueys's care, be possible to attack the French on the landward side, either by cutting in between the leading ship and the shoals, or by breaking through between two ships. The British fleet was approaching from the

north with the wind a little west of north, so that there was nothing to prevent their doing either or both. Nelson's orders were that part of the fleet was to get to landward of the enemy and part was to remain to seaward; the northern end of the line was to be attacked first and the English ships were to anchor only by the stern so that, by merely paying out cable, they would be able, as each French ship was demolished, to move on to deal with others which would, owing to the direction of the wind, have found it impossible to come to the assistance of those attacked first.

It was nearly dark when Captain Foley, of the "Goliath," leading the English line, took his ship between the "Guerrier," the leading French ship, and the shore. Raking the "Guerrier" in passing, he went on to anchor on the port quarter of the next French ship, the "Conquérant." Captain Hood, who followed, in the "Zealous," anchored on the port bow of the "Guerrier." The three following ships, the "Audacious," the "Theseus" and the "Orion" broke through the French line and took up positions between the enemy and the shoals. Next came Nelson, in the "Vanguard," and his was the first ship to take up her station to seaward, anchoring opposite the "Spartiate," the third French ship, which was already receiving the attentions of the "Theseus" on the other side and was thus doomed to an eventual surrender. All the remaining ships took up their positions to seaward of the French, with the exception of the "Majestic" and the "Alexander," which broke through, and of the "Culloden," commanded by Nelson's friend, Troubridge, which was unfortunate enough to run ashore on a projecting sandbank before getting into action. Even this was not without its blessings, since, by hanging out signal lights, Troubridge was able to warn the ships following against suffering a similar fate, and they all escaped it. The enormous "Orient" was engaged first by the "Bellerophon" and then by the "Swiftsure" and "Alexander," which were the last ships into action, one on each side of her. The French flagship fought stubbornly, but she was set on fire and at ten o'clock blew up with a colossal explosion. Surrenders to the British were now becoming frequent, and as each ship was taken, the victors were able to move on and engage others which, no doubt mystified and confused in the darkness, were complacent enough to wait their turn. In this way the entire French fleet was accounted for with the exceptions of the two rear battleships and two frigates which made off in time; it is interesting to note that they were all taken or destroyed in subsequent actions. The victory of the Nile was one of the most complete in the annals of naval history, and was rich in results. It enabled England to capture Minorca and Malta; it completely restored her position and prestige in the Mediterranean; and this, in turn, enabled Pitt to conclude successfully his negotiations for the formation of a new coalition.

See Southey, *Life of Nelson,* ed. G. A. R. Callender (1922, bibl.).

(G. A. R. C.; J. G. B.)

NILES, a city of Berrien county, Michigan, U.S.A., 93 mi. E. of Chicago, on the St. Joseph river. Four main highways cross in Niles, federal highways 31, 112 and state highways 40 and 60. It is served by the Michigan Central railroad (a division of the New York Central railway), the Big Four railroad and motorbus lines, and has a municipal airport. The population in 1950 was 13,145; in 1940 it was 11,328 (97% white, 2% Negro and 1% foreign) by the federal census. It is in the St. Joseph valley, a rich fruit-growing, farming and dairying region. There are diversified industries which make Niles an important manufacturing centre.

On or near the site of Niles, French Jesuits established a mission in 1690, and the French government in 1697 erected Fort St. Joseph, which was captured from the English by the Indians in 1763 and in 1781 was seized by a Spanish party from St. Louis. The present city was founded in 1826 and incorporated in 1859.

NILES, a city of Trumbull county, O., U.S., on the Mahoning river, 10 mi. above Youngstown; served by the Baltimore and Ohio, the Erie and the Pennsylvania railways. Pop. (1950) 16,773; (1940) 16,273. It is an important industrial centre, manufacturing especially steel sheets, glass, metal stampings and fabricating, chemicals and firebrick, with a factory output in 1949 valued at $75,000,000.

Niles was settled in 1832, incorporated as a village in 1865 and chartered as a city in 1895. It was named (1834) after Hezekiah Niles (1777–1839), founder and editor of *Niles's Register* (1811–49); and was the birthplace of Pres. William McKinley, to whose memory a memorial was erected there.

NILGAI ("blue bull"), the largest antelope (*Boselaphus tragocamelus*) found in India, where it represents the kudu and eland group of Africa. Only the bulls have horns, and these are short. The general colour of old bulls is bluish-grey, but younger bulls and cows are browner. It is about the size of a mule (*see* ANTELOPE).

NILGIRIS, THE (Blue Mountains), a system of hills in southern India, which gives its name to a district of the Madras Presidency. The Nilgiris form a plateau rather than a range, rising abruptly from the plains on most sides, with a general elevation about 6,500 ft. above sea-level.

The DISTRICT OF THE NILGIRIS is the smallest administrative district in Madras. It was formerly confined to the plateau, but was increased by the addition of portions of the Wynaad, making a total area of 982 sq.m. The administrative headquarters are at Ootacamund (*q.v.*). There is an abrupt descent of about 6,000 ft. from the plateau to the plains, save on the north, where the base of the mountains rests upon the elevated land of Wynaad, and Mysore, standing between 2,000 and 3,000 ft. above sea-level. The Ochterlony valley and Wynaad country consist of a series of broken valleys, once forest-clad throughout, but now studded with tea and coffee-gardens. The highest peak is Dodabetta, 8,760 ft. There are six well-known passes or *ghats* by which the district communicates with the neighbouring plains, three of which are practicable for wheeled traffic. The chief rivers are the Moyar, Paikara and Calicut, none of which is navigable. The forests consist of fine timber trees, and eucalyptus and Australian wattle have been extensively planted in the higher grounds of the Wynaad. Large game animals of many kinds are numerous. The hill tribes include Todas, Badagas and Kotas. The population of the district in 1921 was 126,519. The commercially important products are coffee, tea and cinchona. The latter is cultivated by the government, and also in private gardens, and there is a government quinine factory. The climate of the Nilgiri hills is extremely equable. A branch of the Madras railway runs from Podanur to Mettupalaiyam, whence a metre-gauge line on the rack principle goes to Coonoor, where there is a silk-farm, and Ootacamund. The Lawrence Memorial School at Ootacamund is maintained by government. The military quarters are at Wellington.

NILOTES, certain peoples of the Anglo-Egyptian Sudan, of whom the Shilluk and Dinka, best known representatives of these tall "black"-skinned dolichocephals, have an average stature of about 1·78m. (about 70in.) or perhaps a little more, and a cephalic index which varies around 72. In these tribes, as well as in the Nuer and Anuak, there is an Hamitic element, and although the majority have coarse features, with broad noses, among the Shilluk and probably the Anuak men with shapely features, including thin lips, long, relatively high-bridged, narrow noses, and well modelled foreheads are not uncommon.

The languages of the Nilotes form a sub-group of the family of languages called by Meinhof "Sudanic," characterized by the absence of inflection and grammatical gender and by the use of tone rather than accent, while typically each word consists of one syllable (*see* AFRICAN LANGUAGES). Shilluk so closely resembles Anuak that the two peoples can understand one another, and the same probably holds for Dinka and Nuer.

Mode of Life.—The Nilotes are essentially pastoral and largely riverain, their interest in their cattle being so far predominant that they usually grow scarcely enough grain to supply themselves till the next harvest. For the most part the men go absolutely naked, the women wear a pair of leather aprons reaching from waist to knee. The forehead is often scarred, and the lower incisors are generally removed. The skin is commonly smeared with the ash of wood and cattle dung. Ivory armlets are worn and the hair may be worked into elaborate head-dresses. Cannibalism is unknown and human sacrifice is almost entirely absent. The number of cattle constituting the bride price is a matter of

great importance, and this is usually paid in instalments. Certain iron-making groups of Dinka living near the Nile-Congo Divide, having few or no cattle, pay for their wives in iron. Widows are inherited by their husband's heirs, the children that they bear being counted as children of the first husband. Psychically the Nilotes, especially the Dinka, are distinguished from all other groups in their extreme aloofness and pride of race, showing absolutely no desire for European clothes or trade objects.

The social organization of the Shilluk is into a number of exogamous groups, but whether these are totemistic must be left for future investigation. Among the Dinka, who consist of a congeries of independent tribes, there are typical totemistic clans with descent in the male line, the totem being an animal, plant or even a natural object such as a meteor or fire. Almost all the clans whose totem is an animal derive their origin not from the animal itself but from a man born as one of twins, his fellow twin being an animal of the totem species, though sometimes the association is not quite so close, as when the totem animal lays certain commands upon members, offering in return certain privileges.

Religion.—Among the Dinka and Shilluk, the only two Nilotic tribes of whose religious ideas there is definite knowledge, the king (Shilluk *ret*) or chief (Dinka *baiñ*) is the rain-maker and belongs to the class of rulers called by Sir James Frazer Divine Kings, *i.e.*, there is immanent in each a divine spirit upon which depends the fertility and well-being of the universe. Such divine kings are not allowed to go to battle and were formerly killed ceremonially with their own consent when they showed signs of ill-health, or sometimes even of diminishing strength, lest the decline in vigour of their body—the living shrine of the divine spirit—should entail the weakness of the latter, when the cattle would sicken and fail to bear their increase, the crops would rot in the fields, and men, stricken by disease, would die in ever increasing numbers. The Shilluk king is indeed the classical example of the divine king, and two stages of his treatment can be traced; the earlier, preserved alone in folklore, refers to a time when anyone could kill the king and become his successor until he in turn was killed by a stronger, while in more recent times the killing of the king has become a ceremonial affair, the leading part being assigned to certain families called the Ororo.

In the case of the Shilluk the divine spirit incarnate in each king is *Nyakang*, the historic founder of the Shilluk kingdom and their culture hero. Like so many divine or semi-divine characters he did not die but vanished in a great storm. He has ten cenotaph tombs, the most sacred perhaps being that of Fenikang, the village in which he lived for a great part of his life. It is the presence of the divine spirit of Nyakang in the ruling king which enables the latter to move the High God, Juok, to send rain.

See W. Hofmeyer, *Die Shilluk* (1925); C. G. Seligman, "The Cult of Nyanking," *Fourth Report of the Wellcome Laboratory*, 1911, Vol. B. (C. G. S.)

NILSSON, CHRISTINE (1843–1921), Swedish singer, was born at Wederslöff, near Wexiö, Sweden, on Aug. 20, 1843, of poor parents. She studied in Paris, where she made her début in the rôle of Violetta at the Théâtre Lyrique on Oct. 27, 1864. Between that date and 1872, when she married M. Auguste Rouzaud, she was the leading prima donna. Her first appearance in London was in 1867. A year later, on the 9th of March, she made her first appearance in the Paris Opera house as Ophélie in *Hamlet;* and she visited the United States in 1870. After her marriage her appearances in public were rare. After her second marriage in 1887, with Count A. de Casa Miranda, she retired from the stage.

Madame Nilsson died at Copenhagen on Nov. 22, 1921.

NIMBUS: *see* AUREOLA.

NÎMES, a city of southern France, capital of the department of Gard, 174 mi. S. by W. of Lyons on the P.L.M. railway, between Avignon and Montpellier. Pop. (1946) 91,667.

Nîmes, the ancient *Nemausus*, was named from the sacred wood in which the Volcae Arecomici (who surrendered to Rome in 121 B.C.) held their assemblies. Strabo states that it was the metropolis of a district containing 24 dependent towns, and that it was independent of the proconsuls of Gallia Narbonensis. Constituted a colony of veterans by Augustus, and endowed with numerous privileges, it built a temple and struck a medal in honour of its founder. The medal, which afterwards furnished the type for the coat of arms granted to the town by Francis I, bears on one side the heads of Caesar Augustus and Vipsanius Agrippa (the former crowned with laurel), while on the other there is a crocodile chained to a palm-tree, with the legend COL. NEM. Agrippa built the public baths, the temple of Diana and the aqueduct of the Pont du Gard. The city walls, erected by Augustus, were nearly 4 mi. in circuit, 30 ft. high and 10 ft. broad, flanked by 90 towers and pierced by ten gates. Hadrian on his way back from Britain erected at Nîmes two memorials of his benefactress Plotina. In the very height of its prosperity the city was ravaged by the Vandals; the Visigoths followed, and turned the amphitheatre into a stronghold, which at a later date was set on fire along with the gates of the city when Charles Martel drove out the Saracens. Nîmes became a republic under the protection of Pippin the Short; and in 1185 it passed to the counts of Toulouse, who enclosed it with ramparts, less extensive than that of Augustus, still to be traced in the boulevards. The city took part in the crusade against the Albigenses in 1207. Under Louis VIII it received a royal garrison into its amphitheatre; under Louis XI it was captured by the duke of Burgundy, and in 1420 was recovered by the dauphin (Charles VII). On a visit to Nîmes Francis I enriched it with a university and a school of arts. By 1558 about three-fourths of the inhabitants had become Protestants, and in 1567 a massacre of Catholics took place on St. Michael's day. From the accession of Henry IV till the revocation of the edict of Nantes (1685) the Protestant community devoted itself to active industry; but after that disastrous event great numbers went into exile or joined the Camisards. Louis XIV built a fortress (1687) to keep in check the disturbances caused by the rival religious parties. Nîmes passed unhurt through the storms of the Revolution; but in 1815 Trestaillon and his bandit followers pillaged and burned and plundered and massacred the Bonapartists and Protestants.

Nîmes lies at the foot of the Garrigues, a range of barren hills on the north and west. The most prominent of these is the Mont Cavalier, on the summit of which is the Tour Magne, a ruined Roman tower. To the south and east the town overlooks the plain of the Vistre, largely used for the vine. The central and oldest part of the town consists of low buildings and is encircled by boulevards, which occupy the site of the old fortifications. Here are to be found the majority of the Roman remains for which Nîmes is remarkable. The most celebrated is the amphitheatre, the best preserved in France. It dates from the 1st or 2nd century A.D. and was used as a fortress for some time during succeeding centuries. Occupied during the middle ages by a special quarter, with a church, it was cleared in 1809. It is built of large stones fitted together without mortar. In form it is elliptical, measuring approximately 440 by 336 ft. externally; the arena is 227 by 126½ feet. The elevation (70 ft. in all) consists of a ground story of 60 arches, an upper story of 60 arches and an attic with consoles pierced with holes for supporting the *velarium* or awning. The building, which was capable of holding nearly 24,000 persons, has four main gates, one at each of the cardinal points; and 124 doorways gave exit from the 35 tiers of the amphitheatre to the inner galleries. Originally designed for gladiatorial shows, naval spectacles, chariot races, wolf or boar hunts, the arena has in recent times been used for bull-fights. The celebrated Maison Carrée, a Roman temple 82 ft. long by 40 wide, is a famous monument, and according to an inscription is dedicated to Gaius and Lucius Caesar, adopted sons of Augustus, and dates from the beginning of the Christian era. In contains a collection of antique sculptures and coins. The so-called temple of Diana, which adjoins the Fountain gardens, was probably connected with the baths of which remains are visible near by. Two Roman gates, the Porte d'Auguste, consisting of two large archways flanked by two smaller ones and dating from A.D. 16, and the Porte de France remain. The Tour Magne (Turris Magna) is still 92 ft. in height, and was formerly higher. It is the oldest monument of Nîmes, but its use it not clear. It was turned into a fortress in the middle ages by the counts of Toulouse. Near the

Tour Magne was discovered the reservoir from which the water brought by the Pont du Gard (*see* AQUEDUCTS) was distributed throughout the city.

With its capital, the temple of Augustus, the basilica of Plotina erected under Hadrian, the temple of Apollo, the baths, the theatre, the circus, constructed in the reign of Nero, the Campus Martius and the fortifications built by Augustus, Nîmes must have been one of the richest of the Roman cities of Gaul. The cathedral (St. Castor), occupying, it is believed, the site of the temple of Augustus, is partly Romanesque and partly Gothic in style. The churches of St. Paul and St. Baudile are modern. The Fountain gardens owe their name to a spring of water which fluctuates considerably in volume, and discharges into the Vistre; the town water comes from the Rhône. Alphonse Daudet and the Provençal poet Jean Reboul were natives of the town.

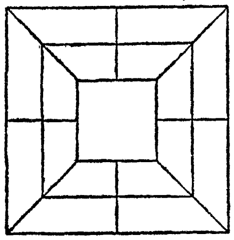
The city is the seat of a bishop under the archbishop of Avignon, a prefect, a court of appeal and a court of assizes, and has tribunals of first instance and of commerce, a board of trade-arbitrators and a chamber of commerce. At the close of the middle ages the industries of Nîmes received an impetus from a colony from Lombardy and Tuscany, and maintained their importance, so that before the revolution about half of the whole community were engaged in manufactures, chiefly that of silk. Upholstery materials, shawls, carpets, handkerchiefs, tapes and braidings, brandy, hosiery, leather, clothes, candles, machinery and boots and shoes are now manufactured, and there are a number of foundries. Nîmes is, besides, a great market for wine and brandy, and there is a good trade in grain, groceries and colonial wares. Quarries of hard limestone, used for the amphitheatre and other Roman buildings, are still worked in the vicinity.

NIMROD is described in Genesis x, 8–12 as the first "to be a mighty one in the earth," which Skinner in his commentary paraphrases as "originator of the idea of the military state, based on arbitrary force." Apart from 1 Chron. i, 10, which quotes this description, the only other reference to Nimrod in the Old Testament is Micah v, 6, where Assyria is called the land of Nimrod. Unlike the other names in the Genesis context, which are names of peoples, Nimrod is that of an individual. He is a son of Cush, which cannot mean, as it usually does, Ethiopia, but possibly stands here for the Kashshu, a people who conquered Babylon in the 18th century B.C. The beginning of Nimrod's kingdom is said to be Babel, Erech, Accad and Calneh, in the land of Shinar. Babel is Babylon; Erech, a city of Babylonia, is the present-day Warka; Accad, "Agade," the royal city of Sargon I., was the capital of a district of the same name in N. Mesopotamia; Calneh is unknown. Shinar, which the O.T. sometimes identifies with Babylonia, was, as Egyptian and Hittite records show, a distinct country, probably in N. Mesopotamia, which was prominent 1500–1200 B.C. Nimrod is said to have built Nineveh, Calah, an Old Assyrian town on the left bank of the Tigris, south of Nineveh, Rehoboth-Ir and Resen, both of which are unknown. It is in accordance with historical truth that Assyria was developed from Babylonia. The description of Nimrod as a "mighty hunter before the Lord," that is, a supreme hero of the chase, is an intrusion in this context, but probably, like the historical notices, derived from some old Babylonian saga. The Assyrian kings were noted for their prowess in hunting. But though we may feel reasonably sure that the Nimrod traditions were derived from Babylonian sources no equivalent of the name has yet been found in the cuneiform records. In character there is a certain resemblance between Nimrod and the hero Gilgamesh. Jensen, and later, with some hesitation, Jirku, suggested that the name NIN-IB of a Babylonian god might be read phonetically Namurtu, and compared with Nimrod. But Clay (*The Origin of Biblical Traditions*, p. 22 *seq.*) seems to have demonstrated that the correct reading is Nin-martu. Meyer says that the name Nimrod is common in Libya, but his theory that the saga was Libyan, and came to Israel via Egypt, seems improbable. (W. L. W.)

NINEBARK, any shrub of the genus *Physocarpus* of the rose family (Rosaceae). One of the best known is *P. opulifolius,* native from Quebec to Manitoba, south to Georgia and Kansas, and commonly planted for ornament. It grows from 5 to 10 ft. high, with strong, recurving stems, exfoliating bark and small, white or pinkish flowers, in umbel-like clusters, followed by clustered, inflated, reddish follicles. There are variegated and dwarf varieties.

NINE MEN'S MORRIS, a game played with counters on a board, also known as Muhle (Germany and Austria), Marelle (France), Mylla (Iceland), Siegen Wulf Myll (Poland) and The Mill, Morelles, Merry Peg, etc., in England.

The board (*see* diagram) comprises three concentric squares and several transversals, making 24 points of intersection. Two players, each provided with nine counters of his own colour, lay pieces alternately upon the points, the object being to get three in a row upon any line. On doing so, the player is entitled to remove from the board one adverse counter, but not one that is in a "mill," a row of three. Having placed all their counters, the players continue moving alternately, with the same object. A "mill" may be opened by moving one piece off the line; returning the piece to its original squares counts as a new "mill." The player who first captures all the adverse pieces wins. A move is limited from one point to the next along a line, but the rule is often made that when a player has only three pieces left he may move them from any point to any point regardless of the lines. In modern play the diagonal lines of the board are usually omitted, to lessen the advantage of the first player.



THE MILL BOARD

In modern play the diagonal lines are usually omitted

The mill board has been found carved or painted on innumerable relics of antiquity—on the steps of the Acropolis at Athens, on a Roman tile dug up at Silchester, England, on the deck of a Viking vessel discovered at Gokstad, on a tombstone in the Isle of Man. The game has been known since ancient times in India and China, among many African tribes, and on the Amazon, where it is called Trique and is held to be of Indian origin. The Greek game Petteia, played with pebbles upon an identical board, was supposed to have been invented by Palamedes prior to the siege of Troy, but later research indicates that this pebble game was played by shepherds in western Asia for centuries before the age of Homer. Some hold that mill, tit tat toe, pachisi, draughts (checkers), and chess all had a common ancestor.

The mill game is often played by shepherds with stones upon a diagram cut into the turf. Shakespeare alludes to this practice in *Midsummer Night's Dream* (Act II, scene I):

> The nine men's morris is fill'd up with mud,
> And the quaint mazes in the wanton green
> For lack of tread are indistinguishable.

This passage made "Nine Men's Morris" the best-known among many English variant names. "Morris" (*i.e.,* Moorish), is the name of a square dance to which the pebble game bears a fanciful resemblance. (G. MH.)

NINEVEH. The ancient capital of the Assyrian empire lay on the right bank of the Tigris opposite the modern city of Mosul. It consists of two great mounds, Kouyunjik and that on which today is the reputed tomb of the prophet Jonah (Nebi Yunus). The river has now shifted a short distance to the west so that the mounds are isolated from the present bed, although in ancient times the city abutted on the river. The city is situated on the northwest corner of a plain about 25 by 15 mi. in extent, formed by the Tigris and its tributaries, the Khosr on which Nineveh was built, which bounds the plain on the northwest, the Gomal, which forms the northeastern boundary, and the Upper Zab on the southeast. The western and south flank is protected by the Tigris itself. The whole plain slopes gently to the Tigris and provides a strong position, being protected by the foothills and the Gomal on the northeastern side, and on the south and west by the Tigris and the Upper Zab. The Khosr, although impassable enough when flooded forms at other times no barrier to attack. The position of Nineveh therefore astride this stream at its confluence with the Tigris is of great strategic importance. The Khosr was used to supply water to fill the protective works of the city and elaborate measures of river conservancy were taken to protect the plain against its most destructive inundations. Although the country is a fertile and prosperous wheat growing land, a fact which no doubt accounts for the many ancient cities so close to one another, owing to the slope of the plain the city itself is badly supplied with water and Sennacherib was compelled to build water conduits to conduct water from the hills into the Khosr and its canal system. The city then, although formerly, as is its modern descendant Mosul, the centre of a rich district, was suited particularly to military efficiency.

The city itself was surrounded by immense walls, which enclosed an irregularly shaped space, about three mi. long and about a

mile broad at the north where the walls were double, narrowing to about three quarters of a mile at the southern end. The walls were pierced by 15 gates. As in so many walled cities the actual dwellings did not occupy the whole of the space within the walls, there were parks watered by the elaborate aqueducts which brought water from the Khosr and other open spaces. The two great mounds formed two great fortified strongholds, and were joined together by a wall, part of which formed the west wall of the city. The mound of Kouyunjik, explored by R. Campbell Thompson on behalf of the British Museum contains an important series of buildings. On the north lay the palace of Assur-bani-pal. South of this lay the Temple of Nabu.

On this spot a rectangular building was found, 100×80 ft. which probably included part of the temple buildings and of the courtyard. Directly south of this again is today a broad pit which may possibly represent the site of the temple of Ishtar which is known to have existed on the mound. To the east is a building of Sennacherib, whose purpose does not seem to have been identified. Finally at the southwestern extremity of the mound is the palace of Sennacherib. This palace is of great architectural magnificence and is especially remarkable for the bas-reliefs which have so far been discovered. On the other mound Sennacherib built a military depot; his son Esar-Haddon built himself a palace on this mound, which has not at present been fully explored.

Although the greatness of Nineveh covers a comparatively short period there are indications that the city was Sumerian in origin. and early pottery and obsidian flakes have been found on the site. It has been suggested that possibly the Sumerians occupied this whole area before migrating south. The true history of Nineveh however begins at a comparatively late date. Hammurabi restored a temple of Ishtar, probably in Nineveh and Shalmaneser I, nearly 1,000 years later, about 1300 B.C. restored the temple again but although Sennacherib states that some of his ancestors were buried there the city was small and unimportant. He built the great building and walls which have been described and made a great triumphal way. His son Esar-Haddon rebuilt the temple of Ashur but started to rebuild Babylon, and did not carry out Sennacherib's purpose of making Nineveh the capital city of the Assyrian empire. Assur-bani-pal enriched the city with some of its greatest treasures, including a great library of clay tablets. In 612 B.C. the men of Nineveh were defeated by the Medes and the city was looted and destroyed. It seems probable that Mespila, referred to by Xenophon in the Anabasis refers to this site, and if so the spot was deserted at this time, but the name of Nineveh was applied to the site even in the middle ages, so an ancient tradition must have existed as to the location of the town. The site however did not become of any importance again till the time of the Arab conquest, when it lay on the opposite bank of the Tigris. (For later history *see* MOSUL.) The site has been attacked by numerous excavators from Layard onwards. In 1903–05 it was excavated by L. W. King and R. Campbell Thompson.

NINGPO ("City of the peaceful waves"), an important Chinese city and chief commercial centre of the province of Chekiang, lying in a fertile plain backed by mountains on the south side of Hangchow bay, and about 12 mi. upstream from the mouth of the River Yung. The district of Ningpo, covering an area of 21 sq.mi., has a population of about 680,000, of whom 212,397, according to the census of 1928, live in the city. The city is of great antiquity and has occupied its present site since A.D. 713. It was one of the earliest centres of European settlement in China, the Portuguese arriving there about 1520. The early colony, known as Liampo, flourished until 1545, when the traders, owing to their illegalities, were driven out by the Chinese. Subsequent regulations and restrictions made foreign trade with Ningpo virtually impossible. In 1840 British war-vessels blockaded Ningpo and the following year, after the fall of Chinhai, a fortified town at the mouth of the Yung river, it was entered without resistance. In 1842, by the treaty of Nanking, Ningpo was opened to foreign trade, and the question then arose as to whether Shanghai or Ningpo should become the commercial metropolis in this region of the coast. Shanghai assumed that rank and since then has impeded the growth of Ningpo's trade. The opening of Wuhu (1877) and Hangchow (1896) also contributed to the diversion of this trade. After World War I, however, the value of the trade increased considerably. After the outbreak of the war in 1937 Ningpo remained one of the few ports in Chinese hands open to trade and while its import trade remained about the same, its export and interport trade increased considerably. Figures for foreign trade are given in Table I.

TABLE I—*Values of Foreign Trade*

	1937	1938	1939
Imports	$620,602 (U.S.)	$ 258,907 (U.S.)	$ 198,032 (U.S.)
Exports	7,507 (U.S)	1,018,412 (U.S.)	1,166,082 (U.S.)

Table II shows values of interport trade for 1936 and 1939.

TABLE II—*Values of Interport Trade*

	Imports	Exports	Re-exports
1936	$5,009,884 (U S)	$4,748,101 (U.S)	$ 20,822 (U.S.)
1939	4,427,097 (U.S)	2,680,949 (U S.)	2,271,504 (U.S)

Ningpo was formerly the port of shipment for cotton grown in the neighbouring districts; the annual export to Shanghai amounting to about 180,000 bales, for native drugs, tea, and more especially, fish and fish products. It had about 1,500 "couples" of junks engaged in the sea fisheries around the Chusan archipelago and supplied large numbers of fishermen. Ningpo was also noted for its grass mats, made of reed or grass grown locally. These mats found a market even in Japan, despite keen competition, owing to their cheapness. Rush is also specially grown and made into braids for straw hats, while laces are knitted in the neighbourhood and shipped chiefly to Shanghai. On the import side, Shanghai supplied Ningpo with considerable quantities of cotton yarn and cotton piece-goods. There were also large imports of kerosene oil and drugs. The total value of the sugar trade of Ningpo was approximately $1,500,000 a year; 70% of the sugar came from foreign sources and the remainder from Fu-kien province. Inland waterway communication in the vicinity of the city is provided by the Yung and the Fenghwa-kiang, as well as by canals. There was a daily steamer service to Shanghai, and regular sailings to Chusan and as far afield as Wenchow. Railway connection with Hangchow, the capital of Chekiang province and about 100 mi. distant, was made by the Shanghai-Hangchow-Ningpo Railway. The chief crops in the district around Ningpo, in order of importance, are rice, beans, wheat, cotton, rush and reed.

Various modern manufacturing industries had been established in the city. Of the cotton mills the Ho Fêng was the largest, drawing the bulk of its raw cotton supply from the neighbouring district of Yuyao. Its yarns were sold chiefly on the local market or elsewhere in Chekiang. About 1,000 looms in small factories and households produced each year 30–40,000 pieces of silk, the bulk of which was dyed in Shanghai. There were, in addition, electrical supplies, hardware, knitting and sewing companies, candle, soap, and canning factories, and numerous tinfoil makers.

The city is encircled by a fine old wall, having six gates, and from 4–5 mi. in length. Among its most prominent features are the many tall ice-houses, the picturesque T'ien-fêng-t'a or Ningpo pagoda, a tall white tower rising to a height of 160 ft., and the Drum tower, many centuries old. The city has long been famous as a centre of learning and religion, and many temples, monasteries and colleges are representative of old Ningpo.

NINIAN, ST., a Briton, probably from Strathclyde, who was trained at Rome and founded a church at Whithorn on the west side of Wigtown Bay. Whithorn has been identified with the Leukopibia of Ptolemy, but this is uncertain. Bede, writing three centuries after Ninian, ascribes the name Ad Candidam Casam to the fact that the church of Ninian was built of stone. We are told by Bede that St. Ninian dedicated his church to St. Martin of Tours, who died between 397 and 400, but Ailred of Rievaulx is our only authority for the statement that St. Martin supplied him with masons. The legends of his work in Ireland probably

arise from the influence exercised in that country by the church of Whithorn.

The date of Ninian's death is given by Archbishop Ussher as 432, but there is no authority for this statement.

Skene, *Celtic Scotland*, vol. ii, 2 ff. (Edinburgh, 1877); J. Rhys, *Celtic Britain*, p. 173 (London, 1904); A. B. Scott, *S. Ninian, Apostle of the Britons and the Picts* (1916); W. D. Simpson, *Saint Ninian and the Origins of the Christian Church in Scotland* (Edinburgh, 1940).

NINUS, in Greek mythology, the eponymous founder of the city of Nineveh (*q.v.*), and thus the city itself personified. He was said to have been the son of Belos or Bel, to have conquered in 17 years the whole of western Asia with the help of Ariaeus, king of Arabia, and to have founded the first empire. During the siege of Bactra, he met Semiramis, the wife of one of his officers, Onnes, whom he took from her husband and married. The fruit of the marriage was Ninyas; *i.e.*, "the Ninevite." After the death of Ninus, Semiramis, who was accused of causing it, erected to him a temple tomb, 9 stades high and 10 stades broad, near Babylon.

According to Castor (*ap. Syncell.* p. 167), the reign of Ninus lasted 52 years, its commencement falling 2189 B.C., according to Ctesias.

Another Ninus is described by some authorities as the last king of Nineveh, successor of Sardanapalus.

NIOBE, in Greek mythology, daughter of Tantalus and Dione, wife of Amphion, king of Thebes. Proud of her sons and daughters (numbers variously given by different authors), she boasted of her superiority over Leto, the mother of only two children, Apollo and Artemis. As a punishment, Apollo slew her sons and Artemis her daughters. Their bodies lay for nine days unburied, for Zeus had changed the people to stone; on the tenth day they were buried by the gods.

Out of pity for her grief, the gods changed Niobe herself into a rock on Mt. Sipylus in Phrygia, in which form she continued to weep (Homer, *Iliad*, xxiv, 602–617; Apollodorus iii, 5; Ovid, *Metamorphoses*, vi, 146–312). This "Niobe," described by Pausanias (i, 21) and Quintus Smyrnaeus (i, 293–306), both natives of the district, was the appearance assumed by a cliff on Sipylus when seen from a distance and from the proper point of view (*see* Jebb on Sophocles, *Antigone*, 831). It is to be distinguished from an archaic figure still visible, carved in the northern side of the mountain near Magnesia, to which tradition has given the name of Niobe, but which is really intended for Cybele.

According to some, Niobe is the goddess of snow and winter, whose children, slain by Apollo and Artemis, symbolize the ice and snow melted by the sun in spring; according to others, she is an earth goddess, whose progeny—vegetation and the fruits of the soil—is dried up and slain every summer by the shafts of the sun god. C. E. Burmeister regarded the legend as an incident in the struggle between the followers of Dionysus and Apollo in Thebes, in which the former were defeated and driven back to Lydia. W. Heffter built up the story round the dripping rock in Lydia, really representing an Asiatic goddess but taken by the Greeks for an ordinary woman. Enmann, who interpreted the name as "she who prevents increase" (in contrast with Leto, who made women prolific), considered the main point of the myth to be Niobe's loss of her children. He compared her story with that of Lamia, who, after her children had been slain by Zeus, retired to a lonely cave and carried off and killed the children of others. The appearance of the rock on Sipylus gave rise to the story of Niobe having been turned to stone. The tragedians used her story to point the moral of the instability of human happiness; Niobe became the representative of human nature, liable to pride in prosperity and forgetfulness of the respect and submission due to the gods.

The tragic story of Niobe was a favourite subject in literature and art. Aeschylus and Sophocles wrote tragedies upon it; Ovid has described it at length in his *Metamorphoses*. In art, the most famous representation was a marble group of Niobe and her children, taken by Sosius to Rome and set up in the temple of Apollo Sosianus (Pliny, *Historiae Naturalis*, xxxvi, 4).

What is probably a Roman imitation of this work was found in 1583 near the Lateran, and was later placed in the Uffizi gallery at Florence.

NIOBIUM: *see* COLUMBIUM.

NIORT, a city of France, chief town of the department of Deux-Sèvres, 42 mi. E.N.E. of La Rochelle by rail to Saumur. Pop. (1946) 32,752.

Up to the 7th century the Niort plain formed part of the Gulf of Poitou, and the mouth of the Sèvre lay at the foot of the hills now occupied by the town which grew up round the castle erected by Henry Plantagenet in 1155. The place was captured by Louis VIII in 1224. By the peace of Brétigny it was ceded to the English, but its inhabitants revolted against the Black Prince and most of them were massacred when his troops recovered the town by assault. In 1373 the French regained the town. Protestantism made numerous proselytes at Niort, and Gaspard de Coligny made himself master of the town, which successfully resisted the Catholic forces after the battle of Jarnac but surrendered without striking a blow after that of Moncontour. Henry IV rescued it from the league. It suffered severely by the revocation of the Edict of Nantes. Niort is on the Sèvre Niortaise.

The tower of the church of Notre-Dame (15th and 16th centuries) has a fine stone spire and a north doorway with a carved balustrade. The old Renaissance hôtel de ville contains a collection of antiquities. Near Niort are the feudal remains of the fortress of Coudray-Salbart. Niort is the seat of a prefect and a court of assizes. Tanning, currying, chamois dressing, glovemaking and the manufacture of brushes and boots are the staple industries.

NIPIGON, a lake and river of Thunder Bay district, Ontario, Can. The lake is 30 mi. N. of the bay of the same name on Lake Superior, at an altitude of 852 ft. above the sea. It is 70 mi. long and 50 mi. wide, contains more than 1,000 islands, is very deep and has a much-indented shore line measuring about 580 mi.

The river, which drains the lake, descends 250 ft. in the 40 mi. of its course and is the largest stream flowing into Lake Superior. It is widely known for its trout fishing.

NIPISSING, a lake of the district of the same name in Ontario, Can., situated nearly midway between Lake Huron and the Ottawa river, at an altitude of 644 ft. above the sea. It is of irregular shape, with bold shores, and contains many islands; from the north it receives the waters of Sturgeon river. It is 50 mi. in length and 20 mi. in breadth, discharges its waters by French river into Lake Huron and is separated by a low watershed from the Mattawa river, a tributary of the Ottawa.

NIPPON, the Japanese pronunciation of the Chinese name of Japan, "sun origin."

See JAPAN.

NIPPON GINKO: *see* JAPAN, BANK OF.

NIPPUR, an ancient sacred city of Mesopotamia. Nippur lay on the bank of the old course of the Euphrates in 32° N., 45° E. The old bed of the river is represented by present Shatt-al-Nil, whose dry bed now separates the two main groups of ruins. The city lies in the very heart of Sumeria, between the northern cities of Kish, Cutha and Babylon, to which it is nearest in position, and the cities of the south. It was the centre of the national cult of the god Enlil, and no doubt because of its position was the ecclesiastical rival of the southern cities, especially Eridu. The possession of Nippur was an essential for every great dynasty, because the rulers of all the cities throughout the whole of Sumer and Akkad ultimately derived their authority from Enlil, and it is essential in studying the ancient geography of Mesopotamia to remember that the monarchy of the region took its rise from prince-priests, and that even the most powerful monarchs could never afford to separate themselves from the powerful and dominant priesthood. Nippur, therefore, although probably never a lay capital except possibly in later times, throughout its long history always played a very prominent part in Mesopotamian history, and, because of the passion exercised by the priests for recording every transaction, however minute, on clay tablets, has

left us a most complete record both of its life and of the part which it played in national politics. To-day the wide gap between the two rivers has made the irrigation problem a very difficult one but in ancient times the twin rivers approached one another more closely. The narrow strip between the rivers, scarcely more than thirty miles, could be irrigated by water run from the Euphrates to the Tigris and the land between the Euphrates on which there lay a string of cities and the Tigris was of great agricultural value. Nippur, therefore, apart from its sacred position was a land of great wealth.

The prehistoric city was built on the west bank of the Euphrates, and was grouped about the temple of the earth god. The mound now lies on the east bank of the Shatt al Nil. Extensive remains of cremation have been found in all the earlier pre-Sargonic periods and as a matter of comparison it is interesting to note that in the earliest graves at Ur cremation appears to be a purely ritual survival, and that so far at Kish, even in the earliest graves, no signs of cremation have been found. Painted pottery was also found. In the period of Ur-nina, that is, the end of the fourth millennium B.C., the temple area was enlarged and a great rectangular terrace of plano-convex bricks was built. This terrace extended far beyond the temple area and was large enough to include both the temple and its stage tower (*ziggurat*) at the southern end. There were also store houses, cloisters and priests' rooms on the terrace and a large court north of the temple. This building had an inner court, which was surrounded by thick walls and included rooms in which the temple archives were stored.

The restoration of the original form of the city, especially in later times, is made possible by the discovery of a tablet of the Kassite period, now unfortunately lost, which had upon it a sketch plan of the city. It shows part of the city east of the river and enclosed within its own walls, like the forbidden city of Peking, which lies within its own walls and surrounded by the city itself. This inner city formed an irregular square, with sides about 900 yards long and was surrounded by canals, with quays along the walls. The inner city was itself also divided into two by a canal. The temple enclosure was oriented, its angles pointing towards the cardinal points of the compass. The tower of the pre-Sargonic period was on the north side of the inner court. On the east side, next to the tower, was the temple of Ekur, with its chapels and other buildings.

All the important kings held this temple in great veneration and considered its repair and reconstruction as a very necessary pious duty. Under the Semitic occupation Naram-sin rebuilt the temple and the city walls. His building was partly destroyed by Ur-Engur, whose restoration gave the area the form in which we have it recorded. His terrace of sundried bricks covered an area of about eight acres. The ziggurat at the northwestern edge was approached by an inclined plane on the south-east side and was made of crude bricks faced with burnt bricks, set in bitumen. It contained three stages. The city walls built by Ur-Engur followed the general lines of the walls built by Naram-Sin.

The whole sanctuary was later restored by Assur-bani-pal of Assyria in the 7th century. The city had previous to this time been allowed to fall into comparative decay, partly owing to the predominance of Marduk, the god of Babylon, when that city was politically dominant, but it enjoyed a period of renewed splendour under the Kassite dynasty, but this was only a temporary respite. Assur-bani-pal's restoration however gave it a form in some ways more magnificent than it had ever enjoyed, his great ziggurat measuring 128×190 feet. This was the end of Nippur's glories.

It gradually fell into decay. In the Seleucid period it became a fortress, and was used as such until the close of the Parthian period, in the middle of the third century A.D. From this time onwards the city ceased to be of any importance. It degenerated into a mere village, while some of the old sacred area was used, as in so many Sumerian cities as a cemetery. In the tenth century A.D. the site again became of some importance as a Jewish settlement, although it is possible that there may have been Jews settled on the site even earlier, possibly at the time of the exile. In the 12th century it was the site of a Christian bishopric.

The condition of the ruins is thus described by Langdon. "They are not so extensive as Kish but more compact and massive. . . . The grandeur of these lofty unbroken lines of mountainous ridges, whose concealed buildings lie deep beneath the plain level, cannot be described to conjure sufficiently the imagination of the reader. They do not belie the fame of Nippur in cuneiform inscriptions."

ANCIENT DOCUMENTS

The excavators of the site were particularly fortunate in the number of ancient documents discovered. The ancient temple library and its archives were not in the temple itself but in a mound to the south. West of the temple there was a commercial and residential quarter, and here, separated from the temple by a canal, were found the important archives of the Kassite kings and business houses of the Neo-Babylonian and Persian periods.

These archives show that the district was a great centre of the cattle industry. Cattle and sheep were driven to Nippur for the different feast days and careful records of every transaction were kept. The details are so full that an issue is recorded of barley porridge to such humble members of the temple staff as the dogs. There were three main sources of revenue for the temple. First there were a series of tolls or dues of various forms. Secondly the temple was a great owner of property and received considerable revenues as rent. Thirdly cattle breeding was carried on. Nippur under the Kassites was an administrative centre, possibly even a capital city. The taxes, which were paid in kind, were either stored here or at the chief city of the district. The record of these taxes is instructive for the side lights thrown on the economic geography of Mesopotamia nearly four thousand years ago. The products which were paid included wheat, sesame, oil, dates, flour and live stock.

The majority of these temple archives of Nippur have been found at Tal Duraihim (Drehem) a city site about six miles south of Nippur, and three miles S.E. of the modern village of Afaj. This city apparently served as the collecting place for the animals used for sacrifices at Nippur. These animals formed part of the taxes payable under the kings of the third dynasty of Ur, and the records are therefore of the greatest value in giving lists of the towns at the time and their assessable value. The ruins of this site consist of a large crescent-shaped mound, some 300 feet from north to south, and 200 feet in width, while the height above the plain is about 40 feet. Langdon is of opinion that whatever the building under this mound may prove to be it is certainly not a temple.

Clay, *Documents from the Temple Archives of Nippur*, Univ. Penns. II. 2 (Philadelphia 1912); E. Chiera, *Legal and Administrative Documents from Nippur*, Univ. Penn. VIII. 1 (Philadelphia 1914); *Cambridge Ancient History* (Vol. I. 1923) Bibliography. (L. H. D. B.)

NIRVĀNA, in Buddhist dogmatics, means literally "blowing out," *i.e.*, the blowing out or extinction of the fire of passion in one who attains release. Whether such a person became extinct at death is classed in the Scriptures among the questions which the Buddha refused to answer. The term is probably originally Buddhist, but it is also found in Vedānta to express union with Brahma. (*See* BUDDHA AND BUDDHISM.)

NISH, the capital of the Nish department of Serbia, Yugoslavia. Pop. (1931) 35,465, comprising Serbs, Turks, Albanians, Bulgars, Greeks and Jews. The city is not only important commercially, but also strategically since (1) it commands the only two valleys affording easy access from central Europe to the Aegean, (2) it is the meeting-point of several of the chief Balkan highways, and (3) it is the junction on the Belgrade-Nish railway for both Sofia and Salonika, and fortunately, in this respect, is within easy reach of good coal supplies. The town during World War II was one of Yugoslavia's main defense areas and was a principal fortress, the perimeter of the entrenched camp being about 30 mi. with outlying modern works. The surrounding heights were fortified after 1886. The Turkish town, on the N. bank of the Nishava, contains the citadel and many mosques and

picturesque old houses among its winding alleys. It is connected by three bridges with the more modern Serbian town on the south bank, which has wide, fairly well-paved streets, a royal palace surrounded by gardens, a cathedral, government offices, banks and several trading associations. Here too, are the government railway repairing sheds, factories for trucks, engines and carriages, an iron foundry, a pork factory, steam flour mills and an electric power station. The barracks are outside the town. Nish is the see of a bishop and the seat of a district prefecture and a tribunal.

The ancient Roman city *Naissus,* which probably superseded a Celtic settlement, was mentioned as an important place by Ptolemy of Alexandria, and the old fortress on the right bank of the river is believed to have been erected on its site. Under its walls in A.D. 269 the Emperor Claudius destroyed the army of the Goths, and within it, in A.D. 274, Constantine the Great was born. The emperor Julian improved its defences but the town was destroyed by the Huns under Attila in the 5th century, and restored by Justinian. In the 9th century the Bulgarians conquered it, but ceded it to the Hungarians in the 11th century, from whom the Byzantine emperor Manuel I. took it in 1173. Towards the end of the 12th century the town was in the hands of the Serbian prince Stephen Nemanya, who there received hospitably the German emperor Frederic Barbarossa and his Crusaders. In 1375 the Turks captured Naissus from the Serbians. In 1443 the Hungarians and the Serbians retook it from the Turks, but in 1456 it again came under Turkish dominion, and remained for more than 300 years the most important Turkish military station on the road between Hungary and Constantinople. In the frequent wars between Austria and Turkey during the 17th and 18th centuries, the Austrians captured Naissus twice (in 1689 and 1737) but were unable to retain it long. In the first Serbo-Turkish rising, the Serbians, defending the approach to Nish in 1809, fired their magazine and destroyed themselves and the enemy. The Turks built a brick tower in which they embedded 900 Serbian skulls. The ruins are still called *Tyele-Koula* (Tower of Skulls). In the Russo-Turkish war (1877–8) the Serbians captured Nish and the town was ceded to them by the treaty of Berlin (1878). Here the National Assembly, before the Constitution of 1901, was regularly held. During World War I the government withdrew to Nish (1915) when Belgrade was occupied by the enemy, but it was not able to stay there. During World War II, the Germans occupied Nish in April 1941.

NISHAPUR, a town in the province of Khurasan in Iran, 3,920 ft. above sea level, in 36° 12′ N., and 58° 40′ E., 50 mi. W. of Meshed in one of the most fertile districts of Iran, which produces much grain and cotton. The town, which has shifted its position with the ages, has a circuit of two miles. It has moderately good caravanserais and public baths. Pottery making is a special industry. Nishapur in the old Persian is *Nev-shapur-nev*. The second element of the name is that of its traditional founder Shapur (A.D. 241–272). It was once one of the four great cities of Khurasan (*q.v.*), rivalling Rai (Rhages), but the population is now 22,000 (est.). It was an important place in the 5th century, for Yazdajird (438–457) resided there mostly. During the later Sasanids it is seldom mentioned and when the Arabs came to Khurasan (641–642) it was of so little importance that, as the historian Tabari relates, it did not even have a garrison. But under the Tahirids (820–872) it became a flourishing city and rose to importance during the Samanids (874–999). Toghrul, the first Seljuk ruler, made Nishapur his residence in 1037. In 1153, the Ghuzz Turkmans overran the country and partly destroyed it. In 1208 most of the town was destroyed by earthquake and was hardly rebuilt when it was again destroyed by the Mongols. It was rebuilt, suffered again at the hands of the Mongols (1269) and from another earthquake in 1280, and never rose again to its former greatness.

A few miles to the east stands a fine domed mausoleum, the Gadam Gar (1643). Expeditions of the Metropolitan Museum of Art, New York (1934–40) disclosed rich and significant architectural and artistic remains of both Seljuk and pre-Seljuk times. *See* "Excavations at Nishapur, 1934–35," *Bulletin,* Metropolitan Museum of Art, vol. xxxi; xxxii, sec. 2 (1936); xxxiii, sec. 2 (1937); and vol. xxxvii, (1938–40). Four mi. S.E. of the town, adjacent to the mosque of the Imamzadeh Mahruk (a Moslem saint of the 8th century), is the tomb of the astronomer-poet Omar Khayyam, a fine marble shaft and sarcophagus built in 1934. Nearby is the grave of the celebrated poet and mystic Farid ud Din Attar. At Madan, 32 mi. N.W. of Nishapur, at an elevation of 5,100 ft., are the famous mines which have supplied the world with turquoises for at least 2,000 years.

NISIBIS (NUSAYBIN), a frontier fortress and trading town of Turkey on the Syrian border about 130 mi. N.W. of Mosul, Iraq. It lies on the borderland between the mountains and the plain in 37° N. 41° E. at the point where the Yaghyagha (called in ancient times the Mygdonius) passes through a narrow canyon and enters the plain.

In ancient times, and indeed until the 11th century A.D., the plain regions below the town are said to have been wooded and the town was famous for its agricultural products. Strategically, like Edessa (*q.v.*), it commanded the entrance of the valley country from the mountains and has been the site of fighting since Assyrian times to even as late as the 19th century. It also lies on the upper trade route from Mosul to the west and in times of peace has been of importance on this line.

Nisibis has been directed east or west according to the dominant empire of the time. During the Assyrian empire it formed a frontier fort against aggressions from the north, and occupied a similar position in Seleucid times. From the middle of the second century B.C. until the early years of the Christian era it was the residence of the kings of Armenia. Owing to its strength the fortress was of considerable importance during the struggle between Rome and Parthia. It became in early Christian times a religious centre with a Nestorian and a Jacobite bishop. Under the Caliphs it was a frontier fortress and the scene of continuous fighting.

Finally it lost most of its prosperity owing to internal troubles, and according to the Arab chroniclers, the compulsory substitution of wheat for fruit crops. It is probable that an insufficient control of the Bedouins of the desert was responsible for much of Nisibis' lost prosperity. It is now (1945) only a small town of 2,311 inhabitants but the railway to Konia has rendered the site of significance.

NISI PRIUS, in English law, a term used to denote generally all actions tried before judges of the king's bench division. For the history and meaning of this term *see* ASSIZE. In the United States a trial at *nisi prius* is a trial of a civil action in a court of record before a judge and jury.

NISUS, the name of two Greek legendary figures. (1) Son of Pandion of Athens and king of Megara. He had a purple lock of hair, and as long as it grew on his head the city was safe against all attacks. When Minos (*q.v.*) was besieging the city, Scylla (*q.v.*), daughter of Nisus, was bribed by him or fell violently in love with him, and to gain his favour cut off the purple lock and gave it to him, thus betraying the city. Nisus fell, or killed himself, during the sack and was turned into a sea eagle; Scylla swam after Minos' ship, or in punishment for her treachery was tied to the stern and dragged after it, and became a creature called *κεῖρις* or *κίρρις* (*ciris*), usually said to be a bird, as yet unidentified, but sometimes a fish; she is constantly pursued by her father.

Nisus is the eponym of Nisaea, the harbour of Megara; Scylla is sometimes confused with the monster of the same name (*see* ODYSSEUS); the story is one quite common in Greek and other folklore; a combination of External Soul (*see* Frazer, *Golden Bough* 3rd ed., xi, chap. x.) with Maiden Castle (*see* Rose, *Handbook of Mythology,* chap. viii, ix.).

See Roscher's *Lexikon, s.v.,* for identification of the *ciris;* and D'Arcy Thompson in *Class. Quart.,* xix, 155 ff.

(2) A Trojan, son of Hyrtacus, friend of Euryalus, with whom he is killed in an attempt to get through the besieging force and communicate with Aeneas, Virgil, *Aen.* ix.

NITERÓI: *see* NICTHEROY.

NITHARD (d. 844), Frankish historian, was the illegitimate son of Angilbert, the friend of Charlemagne, by Bertha, a daughter of the great emperor. He was educated at the imperial court and became abbot of St. Riquier *in commendam,* never taking the vows. He fought for Charles the Bald at Fontenoy in June 841, and died as the result of wounds received while fighting against the Northmen near Angoulême. The date of his death was probably June 14, 844.

In the 11th century his body, with the fatal wound still visible, was found in the grave of his father, Angilbert. Nithard's historical work consists of four books on the history of the Carolingian empire under the turbulent sons of the emperor Louis I, especially during the troubled period between 840 and 843. This *Historiae* or *De dissensionibus filiorum Ludovici pii,* dedicated to Charles the Bald, is valuable for the light which it throws upon the disintegration of the Carolingian empire.

The *Historiae* has been printed several times. Perhaps the best edition is in Band ii of the *Monumenta Germaniae historica: Scriptores;* it has also been edited by A. Holder (Freiburg, 1882). It has been translated into German by J. von Jasmund (1851; new edition by W. Wattenbach, Leipzig, 1889); and into French in tome iii of Guizot's *Collection des mémoires* (Paris, 1824).

See O Kuntzemüller, *Nithard und sein Geschichtswerk* (Jena, 1873); G. Meyer von Knonau, *Über Nithards vier Bücher Geschichten* (Leipzig, 1866); and W. Wattenbach, *Deutschlands Geschichtsquellen,* Band i. (1904).

NITHSDALE, WILLIAM MAXWELL, 5TH EARL OF (1676–1744), Jacobite leader, was a member of the family of Maxwell (*q.v.*), being a son of Robert, the 4th earl (d. 1696), and a collateral relation of Robert Maxwell (d. 1646), who was created earl of Nithsdale in 1620. His wife was Winifred, daughter of William Herbert, 1st marquess of Powis.

After becoming earl in 1698, he served the exiled house of Stuart in secret, and was suspected as a Jacobite conspirator. In 1712 he resigned his estate to his son William (d. 1776), reserving a life rent to himself. When the Jacobite rising took place in 1715, he joined his friends in the north of England and was taken prisoner at Preston, being sent to London for trial.

The countess of Nithsdale, who was at Terregles when she heard of the capture of her husband, followed him to London, making part of the journey on horseback in bitter winter weather. The earl and the other Jacobites were brought to trial in Westminster hall on Jan. 19, 1716, and condemned to death on Feb. 9. The execution was fixed for Feb. 24.

The countess presented a petition to George I which he refused to receive, and when she knelt before him and took hold of the skirts of his coat he dragged her half across the room before he could break away. Finding that no pardon could be obtained, the countess laid a plan to rescue her husband from the Tower of London. With the help of two Jacobite ladies, she cleverly extricated her husband from his cell on the night before the day fixed for the execution by disguising him as a woman.

The earl escaped from England and was followed by his wife after she had gone back to Scotland to rescue important legal papers which proved the transfer of the estate to their son. After a short stay in France, the earl and countess went to Rome, where they lived in poverty and obscurity. The earl died on March 20, 1744, and the countess in 1749.

Their son, William Maxwell, regained the possession of the family property after his father's death in 1744, since the government could only confiscate his father's life interest; but the title was forfeited, and he died childless.

See Sir A. Fraser, *The Book of Carlaverock* (Edinburgh, 1873).

NITON: *see* RADON.

NITRE, a name given to naturally occurring potassium nitrate; "cubic nitre" is sodium nitrate. The word is adapted from Lat. *nitrum,* which is itself adapted from Gr. *νίτρον.* These terms were originally applied to the naturally occurring sodium carbonate; the connection with potassium nitrate (*sal petrae* or *sal petrosum*) may be traced to Raimon Lull's name sal nitri, which he distinguished from nitrum. In the 16th century the ancient nitrum became altered to natron, a term used for native sodium carbonate, while nitrum, and its adaptation nitre, were retained for potassium nitrate or saltpetre (*see* NITRIC ACID AND NITRATES).

NITRIC ACID AND NITRATES. Nitric acid, HNO_3, an important mineral acid, was one of the earliest of the nitrogen compounds to be prepared and used. Its preparation by the distillation of a mixture of nitre (potassium nitrate), alum and blue vitriol is reported in *De inventione veritatis,* ascribed to Geber (*q.v.*). A similar method was described by Albertus Magnus in the 13th century and by Raimon Lull, who prepared the acid by heating nitre and clay and called it "eau forte."

In 1648 J. R. Glauber devised the process in common use for many years, viz., by heating a nitrate with concentrated sulphuric acid. The true nature of nitric acid was not determined until the 18th century when A. L. Lavoisier (1776) showed that it contains oxygen, while in 1784 H. Cavendish synthesized it by passing a stream of sparks through humid air, proving that nitrogen is also a constituent. In 1816 J. L. Gay-Lussac and C. L. Berthollet established its exact composition. Nitric acid has been known as *aqua dissolutiva, aqua prima, spiritus acidus nitri, spiritus nitri fumans Glauberi* and *aqua fortis.*

Free nitric acid, formed in moist air by the discharge of atmospheric electricity (lightning), is found to a very slight extent in rain water and is also formed in the soil by the oxidation of nitrogeneous organic matter. It is neutralized by the basic substances in the soil to form nitrates, principally saltpetre, KNO_3, and Chile saltpetre, $NaNO_3$, the latter being found in greater abundance and concentrations.

Physical Properties.—Pure 100% nitric acid is a colourless liquid whose specific gravity at 25° C. relative to water at 4° C. is 1.50269, melting point -41.59° C., and boiling point 86° C. at one atmosphere of pressure. It fumes strongly on contact with moist air and is miscible with water in all proportions.

A water solution containing 68% of the acid, which is the approximate composition of the concentrated acid of commerce, is a constant boiling or azeotropic mixture at atmospheric pressure with a boiling point of 120.5° C. and a specific gravity of 1.41. A solution containing less than 68% nitric acid may be separated by distillation at atmospheric pressure into the constant boiling mixture and a distillate of more dilute acid; one with more than 68% nitric acid yields a residue of the constant boiling mixture and a distillate of the more concentrated acid. The very concentrated or pure acid undergoes decomposition when boiled and, with the water formed, may be converted to the constant boiling mixture by repeated distillation. The composition of the constant boiling mixture varies with the pressure at which it is distilled.

Chemical Properties.—Pure nitric acid or its concentrated solutions decompose slowly into water, nitrogen dioxide and oxygen: $4HNO_3 = 2H_2O + 4NO_2 + O_2$; the rate of the decomposition is increased by light and by higher temperature. The concentrated acid is therefore usually coloured yellow due to the presence of part of the nitrogen dioxide which remains in the solution. Nitric acid forms two compounds with water in the solid phase, the monohydrate, $HNO_3.H_2O$, melting point $-37.68°$ C., and the trihydrate, $HNO_3.3H_2O$, melting point $-18.47°$ C.

Nitric acid may be considered to be the hydrate of nitrogen pentoxide although it is almost never prepared by hydration of the oxide. Conversely the pentoxide is normally prepared by dehydrating the concentrated acid with phosphorous pentoxide: $2HNO_3 + P_2O_5 = N_2O_5 + 2HPO_3$. Nitrogen pentoxide is a white solid which is easily sublimed and which decomposes readily into nitrogen dioxide and oxygen.

Nitric acid is a strong acid; in dilute water solutions it is almost completely ionized to hydrogen ions, H^+, and nitrate ions, NO_3^-. Its salts with strong bases are not hydrolyzed in aqueous solution and are neutral to indicators. It neutralizes hydroxide bases and salts of weak acids to form nitrates (*see* below). Due to its strong oxidizing properties, a dilute solution of the acid does not

yield hydrogen when treated with metals, but is reduced to one of the oxides of nitrogen, or to nitrogen or ammonia. However, with very active metals (magnesium, for example), some hydrogen is liberated along with the other reduction products.

Most of the nitric acid produced is consumed in the manufacture of explosives, plastics, lacquers, synthetic fabrics and dyes by the reaction of the acid on organic compounds. In one type of reaction, organic nitrates and water are formed when alcohols and other compounds containing OH groups react with the acid. Glycerol trinitrate, commonly called nitroglycerine, is made by the treatment of glycerine with a mixture of concentrated nitric and sulphuric acids: $C_3H_5(OH)_3+3HNO_3=C_3H_5(NO_3)_3+3H_2O$. The sulphuric acid combines with the water, thus increasing the yield by preventing the reaction of the latter with the product. Cellulose in the form of cotton or wood fibres is similarly treated to obtain cellulose nitrates. The extent of nitration (*i.e.*, the number of nitrate radicals combining with a unit of the cellulose) is controlled to produce either guncotton (smokeless powder) or, with less nitration, the base for pyroxalin lacquers and plastics and certain types of fibres. In the organic nitrates the nitrogen atom is bonded to an oxygen atom which in turn is linked to a carbon. Another type of reaction of nitric acid and organic compounds involves the formation of nitro compounds in which the nitrogen atom of the group $-NO_2$ is bonded directly to the carbon atom.

Methyl benzene (toluene) reacts with nitric acid in the presence of concentrated sulphuric acid to form trinitrotoluene, more commonly known as TNT: $C_6H_5CH_3+3HNO_3=CH_3C_6H_2(NO_2)_3+3H_2O$. (*See* EXPLOSIVES.)

Nitric acid is a powerful oxidizing agent; it oxidizes nearly all of the metals except platinum, rhodium, iridium, tantalum and gold, and a number of the nonmetals such as carbon, sulphur and phosphorus. In its reaction with most of the metals the nitrates are produced, but with tin, arsenic, antimony, wolfram and molybdenum the oxides of the metals are formed. The behaviour of the acid as an oxidizing agent is complex because of the number of possible reduction products which may be obtained. The oxidation or valence number of the nitrogen in nitric acid is $+5$; it may be reduced to nitrogen dioxide, NO_2 ($+4$), nitric oxide, NO ($+2$), nitrogen, N_2 (0), or to ammonia, NH_3 (-3), depending upon the temperature, the concentration of the acid, the presence of catalysts and the activity of the metal or other reducing agent involved.

In general, the more concentrated the acid the less the change in the oxidation number of the nitrogen. For example, copper reduces the concentrated acid to NO_2: $Cu+4HNO_3$ (concentrated) $=Cu(NO_3)_2+2NO_2+2H_2O$, and the dilute acid to NO: $3Cu+8HNO_3$ (dilute) $=3Cu(NO_3)_2+2NO+4H_2O$. A stronger reducing agent may cause a greater change in the oxidation number of the nitrogen, as: $4Zn+10HNO_3$ (dilute) $=4Zn(NO_3)_2+NH_4NO_3+3H_2O$, wherein the reduction product, ammonia (NH_3) combines with the acid to form ammonium nitrate, NH_4NO_3.

On the other hand, the concentrated acid may oxidize the metal or nonmetal to a higher valence stage than does the dilute acid, as:

$S+6HNO_3$ (concentrated) $=H_2SO_4+6NO_2+2H_2O$, and

$3S+4HNO_3$ (warm, dilute) $=3SO_2+4NO+2H_2O$

When iron, copper or chromium is placed in contact with concentrated nitric acid it becomes inactive or passive to the acid and to certain other substances with which it normally reacts; passive iron reduces neither hydrogen ion nor cupric ion, and the passive copper does not reduce silver ion. Passivity may be destroyed by scratching the surface, by the action of reducing agents, or by the effect of a strong magnetic field. It was thought at mid-20th century that the formation of a film of the oxide on the surface of the metal was the cause of the phenomenon.

Nitric acid is highly toxic if taken internally, producing a widespread gastroenteritis, burning pain in the oesophagus and abdomen, and bloody diarrhoea. Death may occur from collapse or from secondary destructive changes in the intestinal canal. On the skin a characteristic yellow staining appears, due to the formation of xanthroproteic acid. Copious quantities of water and mild bases such as sodium bicarbonate solution will assist in neutralizing the effects of internal and external exposures.

Manufacture.—In the laboratory pure anhydrous nitric acid is prepared by gently heating an equimolal mixture of pure concentrated sulphuric acid and pure sodium nitrate under vacuum and condensing the evolved gaseous acid at a temperature near or below its melting point. The reaction is: $H_2SO_4+NaNO_3=NaHSO_4+HNO_3$ (gas).

Commercially, nitric acid is manufactured by three processes. The older method, practically obsolete at mid-20th century, is similar to the laboratory method. Chile saltpetre, a commercial form of sodium nitrate, is heated with an equimolal amount of concentrated sulphuric acid under reduced pressure in iron retorts. Nitric acid boils out of the reaction mixture and is condensed in glass containers. An attempt to bring about a reaction between another molecule of sodium nitrate with the second hydrogen in the sulphuric acid molecule results in decomposition of the nitric acid because of the high temperatures necessary to make the reaction go.

The second and most common method of manufacturing nitric acid is by catalytic oxidation of ammonia. Ammonia can be synthesized as cheaply per pound of nitrogen as Chile saltpetre can be mined and purified, and as a result it largely supplanted the latter as a source material. A mixture of 10% ammonia and 90% air is heated to 300° C., and passed over a platinum gauze catalyst which is heated initially to 900°–1,000° C. Heat liberated in the reaction is sufficient to maintain the catalyst temperature. About 90% of the ammonia is oxidized to nitric oxide: $4NH_3+5O_2=4NO+6H_2O$. From the catalyst the gases pass into absorption towers where two reactions take place: $2NO+O_2=2NO_2$, and $3NO_2+H_2O=2HNO_3+NO$.

The third method of nitric-acid manufacture involves the direction union of atmospheric oxygen and nitrogen in an electric arc: $N_2+O_2=2NO$, followed by the last two reactions of the ammonia process. Equilibrium in the arc reaction favours formation of nitric oxide only at very high temperatures. For example, at 3,900° C. the reaction is only 10% complete at equilibrium. However, if the reaction mixture is quenched quickly to a temperature below 1,000° C. it may be frozen at the high temperature equilibrium proportions. Under the most favourable conditions, the yield of nitric oxide is only about 2.5%; it seemed doubtful at mid-century whether the process could be made commercially feasible even in locations where electric power was cheap. (*See* NITROGEN, FIXATION OF.)

Nitrates.—Inorganic nitrates are chemical compounds with the type formula $Me(NO_3)_n$, where Me represents a metal atom and n may be one, two, or more depending on the valence or combining power of the metal under consideration. Nitrates are crystalline solids at ordinary temperatures. They may be white or coloured, depending on the metallic constituent. As a group they are the most water soluble of all metallic salts. Nitrates are prepared by reaction of the desired metal, its oxide, or its carbonate with nitric acid.

Nitrates of base metals decompose according to the equation: $2NaNO_3=2NaNO_2+O_2$, when heated, whereas nitrates of the less active metals are converted to oxides under the influence of heat: $2Cu(NO_3)_2=2CuO+4NO_2+O_2$. When heated to high temperatures, nitrates are strong oxidizing agents comparable to nitric acid.

Many nitrates are hygroscopic; *i.e.*, they absorb atmospheric moisture if left unprotected. Potassium nitrate is an important exception. Some nitrates contain water of crystallization when precipitated from aqueous solution, one or more water molecules per nitrate molecule forming an integral part of the crystalline structure of the solid material. The amount of water varies with the substance and the temperature. Upon heating the hydrated salts there is a partial to complete conversion to oxide, depending on the metallic constituent. Nitric acid is driven off as a gas.

Nitrates are determined qualitatively by reduction with ferrous ion, Fe^{++}, to nitric oxide and subsequent formation of $FeNO^{++}$, a complex ion with a characteristic deep brown colour. The reaction takes place in the presence of concentrated sulphuric acid which is added slowly to a mixture of the unknown and ferrous sulphate so that the two do not mix. A brown layer at the interface indicates the presence of nitrate ion. Quantitative de-

termination of nitrate ion is usually accomplished by reduction to ammonia by aluminum in alkaline solution, distillation of the ammonia into excess standardized sulphuric acid and back titration with standardized sodium hydroxide solution. (For other nitrogen compounds, *see* NITROGEN.)

BIBLIOGRAPHY.—W. M. Latimer and J. H. Hildebrand, *Reference Book of Inorganic Chemistry* (1951); F. Ephraim, *Inorganic Chemistry*, 4th Eng. ed. (1943); D. M. Yost and H. Russell, Jr., *Systematic Inorganic Chemistry of the Fifth-and-Sixth-Group Nonmetallic Elements* (1944). (W. R. FE.; X.)

NITRIDES are binary compounds of nitrogen with the elements. They apparently do not occur in nature, although F. A. Bannister reported the presence of titanium nitride, TiN, in the mineral osbornite found in the Bustee meteor. The simple nitrides may be regarded as derivatives of ammonia in which the hydrogen atoms are replaced by a metallic or nonmetallic element. Their composition may be represented by formulas corresponding to the normal valence (oxidation number) of the elements based upon their position in the periodic classification; for example, Group I, Li_3N; Group II, Mg_3N_2; Group III, AlN; Group IV, Si_3N_4. Where an element is capable of existing in several oxidation states, corresponding nitrides may be capable of existence; for example, PN and P_3N_5.

In addition to these simple nitrides, compounds with nitrogen are formed by such transition elements as chromium, iron and cobalt, whose structure and composition are more complex and do not conform to valence rules.

Reference is also made to three classes of binary nitrogen compounds which differ markedly from the simple nitrides: (1) the hydronitrogens, compounds of hydrogen and nitrogen which formally resemble the hydrocarbons (*see* AMMONIA); (2) compounds with the more electronegative elements such as oxygen, sulphur and the halogens which are discussed under the respective elements and (3) the trinitrides, containing the N_3 radical which are derivatives of hydrazoic acid, one of the hydronitrogens (*see* HYDRAZOIC ACID).

Preparation.—Many of the nitrides can be prepared by direct combination of the elements with nitrogen, but such reactions take place much less readily, and then usually only at higher temperatures, than the corresponding oxidation reactions. A few elements, notably lithium, magnesium and the alkaline earth metals burn in air to give mixtures of the oxides and nitrides. Nitride formation is aided by use of active nitrogen, by reducing the elements to a fine state of subdivision, by employing the amalgams (*see* MERCURY) and by use of catalysts such as lithium nitride. Nitride formation by direct combination has been observed to take place with the following elements: Mg, Ca, Sr, Ba, Li, Be, B, Al, La, Ce, Pr, Nd, Ti, Zr, Th, V, Cb, Ta, Cr, Mo, W, U, Mn, Fe, Co, Ni, Si, Ge and P. Despite their high reactivity, sodium, potassium, rubidium and caesium do not appear to form nitrides by direct combination. In general, elements of the B subgroups of the periodic classification show little inclination to react directly with nitrogen.

Nitrides may also be prepared by indirect methods, of which the following are the more important:

(1) Mixtures of the oxides with carbon can be converted to nitrides by heating in a nitrogen atmosphere. This procedure is used for the preparation of aluminum nitride in accordance with the equation $Al_2O_3+3C+N_2 \rightarrow 2AlN+3CO$ and constitutes the basis for the Serpek process for the fixation of atmospheric nitrogen (*see* NITROGEN, FIXATION OF). In some cases carbides can be heated directly with nitrogen as in the production of beryllium nitride: $Be_2C+2N_2 \rightarrow 2Be_3N_2+C$.

(2) Gaseous ammonia may serve as the nitriding agent for conversion of certain metals, oxides, sulphides and, in some instances, halides into nitrides. Cuprous oxide reacts with ammonia at 300° C. to yield some cuprous nitride, Cu_3N; at 600° C. zinc is converted into zinc nitride, Zn_3N_2.

(3) Amides and imides of many elements undergo thermal decomposition to yield the nitrides. Nonmetallic halides, in particular, react with gaseous or liquid ammonia at ordinary temperatures to give the amides or imides which may be heated to effect deammonation (removal of ammonia, analogous to dehydration by which hydroxides are converted to oxides), eventually to give the nitrides. Thus, treatment of boron trichloride with ammonia gives first the diboron tri-imide, $B_2(NH)_3$, which on heating loses ammonia to form the nitride, BN.

$$BCl_3 \xrightarrow{NH_3} B_2(NH)_3 \xrightarrow[125^\circ\text{ C.}]{\text{above}} BN$$

The amides of such metallic elements as magnesium, calcium, strontium, barium, zinc, cadmium, nickel and cobalt precipitate when potassium amide is added to solutions of their salts in liquid ammonia. These products likewise undergo deammonation at higher temperatures.

$$M^{++} \xrightarrow{KNH_2} M(NH_2)_2 \xrightarrow{\text{heat}} M_3N_2$$
$$(\text{where } M=\text{Mg, Ca, Sr, Ba, Zn, Cd, Ni, Co})$$

The amides of the alkali metals, with the exception of lithium, do not give nitrides on heating.

(4) Reaction of certain metallic salts with potassium amide in liquid ammonia as the solvent medium affords a procedure whereby nitrides may be obtained which are unstable at the temperatures required to effect direct combination of metal with nitrogen. The following nitrides are precipitated from liquid ammonia solution under these conditions: mercuric nitride, Hg_3N_2, thallous nitride, Tl_3N, bismuth nitride, BiN.

$$\left.\begin{array}{l} Hg^{++} \\ Tl^{+} \\ Bi^{+++} \end{array}\right\} \text{in liquid } NH_3+NH_2^- \text{ (from } KNH_2) \rightarrow \begin{array}{c} Hg_3N_2 \\ Tl_3N \\ BiN \end{array}$$

For methods by which nitrides can be obtained using liquid ammonia as the solvent medium, together with a discussion of nitrides as derivatives of ammonia, *see* E. C. Franklin, *The Nitrogen System of Compounds* (1935). (*See* also AMMONIA and SOLUTIONS.)

(5) Aqueous ammonia converts the oxides of silver, gold and the platinum metals into highly explosive compounds which are assumed to be nitrogen compounds, possibly nitrides. These are often referred to as the "fulminating metals."

(6) Careful decomposition of the alkali and alkaline earth azides by heating gives mixtures of nitrides with the respective metals. (*See* HYDRAZOIC ACID.)

A large number of nitrides have been described in the chemical literature. These may be listed conveniently on the basis of type formula with *M* representing the element with which nitrogen is combined.

Nitrides of the Elements

Type Formula	where *M* =
MN	B, Al, Sc, Y, La, Ce, Pr, Nd, Sm, Er, Ga, In, Si Te, Zr, P, As, Sb, Bi, V, Ta, Cb, Cr
MN_2	V, W
M_2N	Cb, Cr, W, Fe
M_3N	Li, Na, K, Rb, Cs, Cu, Tl
M_3N_2	Be, Mg, Ca, Ba, Sr, Ra, Zn, Cd, Hg, Ge, Zr, Cr, Mo, Mn, Co, Ni
M_3N_4	C, Si, Te, Zr, Th, Ge, U
M_3N_5	P, Cb, Ta

A number of other nitrides have been described, but the identity of some of these is questionable: Si_2N_3, U_5N_4, U_5N_2, W_2N_3, Mu_5N_2, Mn_7N_2, Fe_8N, Fe_4N. For details concerning the nitrides see Gmelins *Handbuch der Anorganischen Chemie*, 8th edition, especially vol. 4 (*Nitrogen*) (1936); also Joseph Mellor's *A Comprehensive Treatise on Inorganic and Theoretical Chemistry* (1922–37).

Properties and Uses.—Nitrides, like oxides, vary considerably in their stability and reactivity.

The nitrides of the noble metals (for example, Hg_3N_2 and BiN) decompose explosively into the elements on heating, whereas the nitrogen compounds of boron, silicon, titanium, zirconium, vanadium, tantalum and molybdenum (as examples of the nitrides of Groups III, IV, V and VI) are characterized by their remarkable stability at high temperatures.

Most nitrides react with water to liberate ammonia as, for instance, $Mg_3N_2+6H_2O \rightarrow 3Mg(OH)_2+2NH_3$, although the tendency to do so depends not only on the specific nitride but also on

the method of preparation and the subsequent thermal history of the compound.

Thus, many of the nitrides prepared at lower temperatures by deammonation of the amides or imides hydrolyze rapidly; if these same nitrides are sintered by heating to a high temperature, they become relatively inert to attack by chemical agents (for example, boron nitride, BN). Structural changes to highly polymerized aggregates are involved. It should be noted, however, that high-temperature treatment changes in some instances the composition of the nitrides to correspond to products of lower nitrogen content; for example, trititanium tetranitride, Ti_3N_4, is converted into titanium nitride, TiN.

Certain nitrides such as those of boron, BN, silicon, SiN, titanium, TiN, zirconium, ZrN, and tantalum, TaN, are extremely refractory materials with melting points near or above 2,500° C. Where this property is combined with chemical inertness such nitrides have found use in the manufacture of crucibles and other equipment which must withstand chemical action at high temperatures. O. Meyer found that crucibles of titanium nitride, TiN, are especially resistant to attack by various molten ferrous metals. The nitrides of boron, titanium, zirconium and tantalum are furthermore characterized by their extreme hardness, above 8 on the Moh hardness scale, and are used either alone or in admixture with borides and/or carbides for hard-metal alloys and abrasive compositions. (The patent literature must be consulted for specific disclosures concerning compositions used for such purposes.) Investigation also revealed that these refractory nitrides possess high electrical conductivity resembling metallic conduction. They may therefore be considered as interstitial compounds with the relatively small nitrogen atoms occupying positions in the expanded crystal lattice of the element, thus accounting for the unusual properties of these substances.

Formation of such interstitial or metallic-like nitrides is also involved in the nitriding process in which steel and its alloys are heated in an atmosphere of ammonia above 800° C. to produce a surface film possessing great hardness, resistance to wear and to chemical attack. (*See* H. J. Emeléus and J. S. Anderson, *Modern Aspects of Inorganic Chemistry* (1938) for a discussion of refractory nitrides.) (L. F. A.)

NITROBENZENE, the simplest aromatic nitrocompound, $C_6H_5NO_2$, was first isolated in 1834 by E. Mitscherlich, and is prepared commercially by the action of a mixture of concentrated nitric and sulphuric acids upon benzene at a temperature of 50° C.—55° C. The oily product, which separates, is washed with alkali, and then distilled. It is a yellowish liquid possessing a strong smell similar to that of oil of bitter almonds. It boils at 210.9° C., and melts at 5.7° C. The products of its electrolytic reduction vary with the conditions: in 50% sulphuric acid solution it yields p-aminophenol (L. Gattermann, 1893); in alkaline solution it yields azoxybenzene, azobenzene, hydrazobenzene or aniline, depending upon the material of which the cathode is constructed, upon the solvent, upon the applied voltage and current density and upon the total amount of current allowed to pass through the solution; in an approximately neutral aqueous or alcoholic solution, it yields β-phenylhydroxylamine; and, in acid alcoholic solution, it yields some benzidine together with other products. With chlorine, in the presence of iodine or antimony chloride, it yields meta-chloronitrobenzene. It occasionally acts as an oxidizing agent, as in the preparation of quinoline and fuchsine (magenta, *q.v.*). It is used commercially for the preparation of aniline (*q.v.*); and of benzidine (*q.v.*); and in perfumery (oil of mirbane).

Dinitrobenzenes, $C_6H_4(NO_2)_2$.—Ortho-dinitrobenzene, produced in small quantity in the preparation of meta-dinitrobenzene, forms colourless crystals which melt at 116.5° C. and boil at 319° C. (773 mm.). When boiled with aqueous sodium hydroxide, it yields ortho-nitrophenol. Meta-dinitrobenzene is formed by the direct nitration of nitrobenzene with fuming nitric acid, the product being poured into water and recrystallized from dilute alcohol. It forms practically colourless needles which melt at 89.7° C., and boil at 302.8° C. It is used for the preparation of metaphenylenediamine. Para-dinitrobenzene results from the action of nitrogen peroxide on an ethereal solution of quinone dioxime; it crystallizes in colourless needles, which melt at 171°–172° C.

Trinitrobenzenes, $C_6H_3(NO_2)_3$.—Asymmetrical (1:2:4) trinitrobenzene results from the action of fuming nitric and sulphuric acids on para-dinitrobenzene. It forms yellow crystals, which melt at 57.5° C. When boiled with dilute aqueous sodium hydroxide it yields 2:4-dinitrophenol. Symmetrical (1:3:5) trinitrobenzene is formed by the further nitration of meta-dinitrobenzene with fuming sulphuric and nitric acids; or by the action of water on 2:4:6-trinitrobenzoic acid (German patent 77,353). It crystallizes in prisms which melt at 121° C.

NITROCELLULOSE (or cellulose nitrate) is the name given to the nitric esters of cellulosic materials, in practice largely cotton linters and wood pulp.

T. J. Pelouze discovered in 1838 that cotton could be converted into a violently inflammable substance by the action of concentrated nitric acid. C. F. Schönbein in 1845 demonstrated the use of this material as an explosive and improved the manufacturing method by adding sulphuric acid to the nitric acid. Nitrocellulose began to be used as an ingredient of gun powders (bulk powders) in the 1860s; gelatinized nitrocellulose propellants (*q.v.*) were introduced in the 1880s. E. A. Brown discovered in 1868 that dry and even moist nitrocellulose could be exploded by a detonator; this discovery started the use of the substance as a high explosive.

The history of its uses is punctuated by many disastrous explosions, caused largely by the failure to appreciate that nitrocellulose is an unstable material and is subject to catalytic decomposition caused by its own decomposition products. This reaction, if not checked in time, results in explosions. Sir Frederick Abel demonstrated in 1868 that the then prevalent methods of washing nitrocellulose after nitration were inadequate and that the residual acid was causing high instability. The introduction of the pulping process and other changes in the washing procedure led to significantly improved nitrocellulose. However, explosions of smokeless powder magazines continued; and in modern practice, which goes back to the researches of Paul Vieille, special stabilizers are added to nitrocellulose; the function of these is to neutralize catalytically active decomposition products. The results of this practice are the modern stable and reliable propellants.

Cellulose molecules consist of thousands of anhydroglucose units, $C_6H_{10}O_5$, linked into chains; therefore the nitration process may be schematically represented by the equation:

$$C_6H_{10}O_5 + xHNO_3 = C_6H_{10-x}O_{5-x}(NO_3)_x + xH_2O$$

Here x is a variable quantity which depends on the composition of the nitrating mixture and on the time and temperature of nitration. Theoretically x can reach the value of three, corresponding to 14.14% nitrogen in the product; but with mixtures of sulphuric and nitric acids such a high degree of nitration is seldom achieved.

The manufacture of nitrocellulose, in principle if not in practice, is a relatively simple process. Cotton linters or sulphite-process wood pulp are dipped into a large excess of nitric-sulphuric acid mixture; after a prescribed length of time, the product is separated from the bulk of the acid, for instance by centrifuging. The nitrocellulose is then "drowned" quickly in excess water and is subjected to boiling in acidified water to eliminate unstable by-products of nitration.

The next step consists in pulping to disintegrate the fibres and to facilitate a subsequent washing, in which the last traces of acid must be removed. Cotton linters were for a long time preferred for the manufacture of gun propellants; but, starting in World War I, wood pulp became more and more accepted. A high content of alphacellulose in wood pulp appears to be essential to ensure high quality of smokeless powders.

Nitrocellulose is a fluffy, white substance, retaining some of the fibrous structure of untreated cellulose. It is rather unstable to heat and even carefully prepared samples will ignite on a brief heating to temperatures in excess of about 150° C.

Nitrocellulose is insoluble in water and in hydrocarbon solvents. It is soluble in acetone, in ethyl acetate, etc. Only the material

with a low content of nitrogen is soluble in alcohol or ether, but intermediate grades are soluble in ether-alcohol mixtures.

Collodion or pyroxylin nitrocellulose, with a nitrogen content not in excess of 12%, is used chiefly for lacquers and celluloid plastics. Materials with a nitrogen content in the neighbourhood of 11.5% were used once, after denitration, as artificial silk, but have been replaced in this role by other materials, such as viscose rayon. This same material continued to be used for the manufacture of photographic films, although the use of safety film, made of cellulose acetate plastics, undermined its popularity.

Collodion nitrocellulose with 12% nitrogen is finding much use in the manufacture of propellants and of gelatin dynamites. The highest degree of nitration which still gives a product soluble in mixed alcohol-ether solvents is 12.6%. This material, discovered by Dmitri Mendeleyev and known as pyrocellulose, is extensively used for the manufacture of propellants. Guncotton, with more than 13% nitiogen and soluble in acetone only, is also used for propellants, either alone or in combination with lower grades of nitrocellulose. Moist guncotton was once widely used as a high explosive (*q.v.*), but it has been replaced by safer materials.

The nitration of cellulose is accompanied by a varying degree of depolymerization of the large molecules. For the manufacture of gun propellants, the depolymerization is largely avoided, but with materials intended for the manufacture of lacquers it is deliberately encouraged since depolymerized nitrocellulose gives solutions of low viscosity which are desirable for this application. NITROCELLULOSE POWDER: *see* GUNCOTTON.

NITRO COMPOUNDS. Organic compounds in which one or more hydrogen atoms are replaced by the NO_2 or nitro group are called nitro compounds. Two main classes of such compounds are recognized—aromatic and aliphatic.

Aromatic Nitro Compounds.—Aromatic nitro compounds contain a benzene ring in which one or more hydrogen atoms have been replaced by a nitro group.

Examples are nitrobenzene, $C_6H_5NO_2$, α-nitronaphthalene and 2, 4, 6-trinitrotoluene (T.N.T.).

The first preparation of an aromatic nitro compound was carried out in 1834 by the German chemist Eilhardt Mitscherlich who prepared nitrobenzene by heating together benzene and nitric acid. Although conditions vary with the compound being nitrated, aromatic nitro compounds have been prepared ever since by essentially similar processes.

Sulphuric acid is commonly used to aid the reaction by combining with the water formed. Nitrations are carried out on a commercial scale in large cast-iron vessels equipped with devices through which cooling water can be circulated to remove the heat of reaction. As much as 1,000 gal. of benzene is nitrated at one time. As successive nitro groups are introduced into an aromatic compound, more drastic conditions must be employed. Thus, the preparation of T.N.T. (*q.v.*) is usually carried out in three successive steps in each of which higher temperatures and stronger acids are used.

Many aromatic nitro compounds cause pronounced physiological reactions and care should be taken to avoid breathing their vapour and also to avoid contact with the skin. Aromatic nitro compounds are heavier than and practically insoluble in water. Most are solids, although a few, including nitrobenzene, are liquids. Commercial preparations of nitrobenzene are yellow, but the completely purified compound is colourless. Nitrobenzene has a slightly sweetish odour; it boils at 210.9° C.

Except as explosives, the uses of the aromatic nitro compounds as such are rather limited. They are used to some extent in perfumery, as solvents and as special oxidizing agents. N,2,4,6-tetranitroaniline (tetryl), T.N.T. and ammonium picrate, as well as other aromatic nitro compounds, are used extensively as explosives.

In peacetime by far the greater part of the aromatic nitro compounds produced is converted into various derivatives. The nitro group is frequently reduced as one step in the preparation of these derivatives.

Aromatic nitro compounds are the starting point in the manufacture of many commonly used dyes. Derivatives of aromatic nitro compounds are also widely used as pharmaceuticals and to some extent as photographic chemicals and as chemicals used in the manufacture of rubber articles.

The presence of a nitro group on the benzene ring influences the reactivity of the other atoms or groups attached to the ring. Ordinarily, positions ortho or para to the nitro group are activated. Examples of this are the oxidation of *m*-dinitrobenzene by potassium ferricyanide to 2,6- and 2,4-dinitrophenols and the reactivity of halogen atoms ortho or para to an aromatic nitro group. Such halogen atoms may be rather easily caused to react with bases, for example, to give nitro phenols.

Most aromatic nitro compounds undergo a reaction known as the Piria reaction when heated with a sulphite and then with a mineral acid. In this reaction, the nitro group is reduced and the benzene ring is also sulphonated.

Thus nitrobenzene gives by this reaction a mixture of aniline and sulphanilic acid.

The most characteristic reaction which aromatic nitro compounds undergo is that of reduction. The products obtained vary according to the conditions employed. Under acid conditions the $-NH_2$ group is usually formed, while neutral or basic conditions generally lead to intermediate reduction products. Nitrobenzene is reduced to aniline, $C_6H_5NH_2$, by the use of iron plus a small amount of acid.

By the use of proper neutral or basic conditions it is possible to reduce nitrobenzene to phenylhydroxylamine, C_6H_5NHOH, azoxybenzene, $C_6H_5N{=}NOC_6H_5$, azobenzene, $C_6H_5N{=}NC_6H_5$, or hydrazobenzene, $C_6H_5NHNHC_6H_5$. Meta-dinitrobenzene is reduced to meta-mitroaniline by the use of sodium hydrosulphide. Meta-nitroaniline is used in the preparation of dyes and of the explosive T.N.A., 2,3,4,6-tetranitroaniline. The fact that aromatic nitro compounds are easily reduced indicates that they are oxidizing agents. This property is made use of in the Skraup synthesis of quinoline in which nitrobenzene serves as an oxidizing agent. The explosion of T.N.T. is an oxidation by the nitro groups of the carbon and hydrogen present in the molecule.

Aliphatic Nitro Compounds.—In aliphatic nitro compounds (commonly called nitroparaffins) the nitro group is attached to an alkyl radical. Thus, nitroethane, $CH_3CH_2NO_2$, is a typical member of the class.

Interest in this class of compounds was stimulated in 1872 by the announcement by the German chemists Victor Meyer and Otto Stüber of the synthesis of nitropentane, $C_5H_{11}NO_2$, by the action of silver nitrite on amyl iodide. This is a general synthesis for many aliphatic nitro compounds, but it does not lend itself to commercial practice, and the fact that the aliphatic hydrocarbons are much more resistant to direct nitration than the aromatic hydrocarbons hindered the development of the nitroparaffins for many years. Finally, in 1940, the first nitroparaffins were produced on a commercial scale by a process employing high-temperature contact between the vapour of propane (C_3H_8, found in natural gas) and nitric acid vapour. The nitration is carried out in a stainless steel tube at temperatures of 300° C.–500° C., and the reaction takes place in a fraction of a second. When propane is nitrated 1-nitropropane ($CH_3CH_2CH_2NO_2$), 2-nitropropane ($CH_3CHNO_2CH_3$), nitroethane and nitromethane (CH_3NO_2) are formed.

The lower nitroparaffins are colourless liquids of mild odour. In contrast with the aromatic nitro compounds the nitroparaffins have about the same toxicity as petroleum naphtha. The nitroparaffins are only slightly soluble in water. The boiling points of the four lowest members, nitromethane, nitroethane, 2- and 1-nitropropane, are, respectively, 101.2° C., 114° C., 120.3° C. and 131.6° C.

The nitroparaffins are used as solvents for such materials as vinylite and cellulose-acetobutyrate resins. They are also used for special solvent purposes such as the purification of pyrethrum, used in fly sprays. Various derivatives are made from the nitro-

paraffins, and the more important of these are considered below.

Nitroparaffins fall into three classes: primary, secondary and tertiary. These have, respectively, two or three, one, and no hydrogen atoms attached to the carbon atom holding the nitro group. These hydrogen atoms take part in various reactions. Thus, primary and secondary nitroparaffins behave as weak acids and form metallic salts. In the presence of small amounts of bases, nitro compounds of these two classes react with aldehydes as shown:

$$\underset{\text{Nitroethane}}{CH_3CH_2NO_2} + \underset{\text{Formaldehyde}}{2HCHO} = \underset{\text{2-Nitro-2-methyl-1, 3-propanediol.}}{CH_3C(CH_2OH)_2NO_2}$$

Aliphatic nitro groups are readily reduced to amino groups, and nitro alcohols produced as shown in the above equation can be reduced to amino alcohols which find important uses as emulsifying agents, constituents of resins and of emulsion-type paints.

By the use of a strong mineral acid at temperatures of 100° C.–150° C., the primary nitroparaffins are converted to fatty acids and a salt of hydroxylamine. Salts of hydroxylamine find use in the preparation of antiskinning agents for paints, vulcanization accelerators for synthetic rubber, and dyes.

When primary or secondary aliphatic nitro compounds are treated with a halogen in the presence of a base, the active hydrogen atoms are replaced by the halogen. This is probably the best way of making chloropicrin, CCl_3NO_2, which finds large-scale use as an insecticide.

Powerful insecticides are made by condensing aromatic nitro alcohols with chlorobenzene, as illustrated in the equation:

$$p\text{—}ClC_6H_4CHOHCHNO_2CH_3 + ClC_6H_5 \xrightarrow{H_2SO_4} (p\text{–}ClC_6H_4)_2CHCHNO_2CH_3.$$

(*See* BLASTING; EXPLOSIVES; NITROGLYCERIN; T.N.T.)

(E.B.HE.)

NITROGEN is a colourless, odourless, tasteless gas, which is incombustible, does not support combustion or respiration, and is one of the most widespread elements. It occurs free in the atmosphere and in various compounds, some of which are found in the proteins of plants and animals and others of which constitute important drugs, dyes and other chemicals. Symbol N, atomic number 7, atomic weight 14.008. Its existence was first recognized by K. Scheele (1772), who showed that common air is a mixture of two gases, which he called "foul air" (nitrogen) and "fire air" (oxygen). He obtained the foul air by removing the fire air in combination with various combustible or oxidizable materials, and showed that the residue would not support combustion or respiration.

Nitrogen was also, independently, discovered by Joseph Priestley and Daniel Rutherford about the same time. Antoine Lavoisier named the gas "azote," from its inability to support life, and recognized that it is an element. The name nitrogen was introduced by J. A. C. Chaptal (1790) to indicate that the element is a constituent of nitre.

Nitrogen occurs in the atmosphere to the extent of approximately 78% by volume and 75.5% by weight, and serves to dilute the oxygen. Free nitrogen is also found in many meteorites and in volcanic gases and gases in mines; its presence in the sun and in certain stars and nebulae is shown by the spectroscope. In combination, it is found in nitre or saltpetre (potassium nitrate), Chile saltpetre (sodium nitrate), ammonia and ammonium salts in the atmosphere, in rain, soil and guano, and as complex organic compounds (proteins) with an average of 16% of nitrogen, in living organisms.

Preparation and Uses.—Nitrogen may be prepared (1) from atmospheric air by removal of the oxygen, or (2) from its compounds. Atmospheric nitrogen contains about 1% of inert gases (argon, etc.).

1. The oxygen is removed from air by exposure to phosphorus at ordinary temperature (burning phosphorus is not so effective), to moist iron filings, an alkaline solution of pyrogallol, an acid solution of chromous chloride or cuprous chloride, or metallic copper in presence of hydrochloric acid or ammonia, or by passing air over red-hot copper.

On the large scale, nitrogen is made almost entirely by the fractional distillation of liquid air, in which process, since it has a lower boiling point than oxygen, it tends to evaporate first. The gas is marketed in gray cylinders under a pressure of about 120 atm. This gas contains most of the helium and neon present in air (*see* ATMOSPHERE), but the argon, which has nearly the same boiling point, mostly remains with the oxygen. Some industrial nitrogen may be made by passing air over heated copper, the copper oxide being afterward reduced by heating in a current of water gas.

2. Pure nitrogen is made from its compounds: (a) By passing chlorine into ammonia solution, $2NH_3+3Cl_2=N_2+6HCl$; (b) by heating a slightly acid solution of ammonium nitrite (or a mixture of sodium nitrite and ammonium chloride), $NH_4NO_2=N_2+2H_2O$; (c) by heating ammonium dichromate, $(NH_4)_2Cr_2O_7=N_2+Cr_2O_3+4H_2O$; (d) by passing a mixture of nitric oxide and ammonia gas over red-hot copper, $6NO+4NH_3=5N_2+6H_2O$; (e) in a very pure state by heating sodium or barium azide in a vacuum, $Ba(N_3)_2=Ba+3N_2$. The gas may be collected over water.

Nitrogen gas is used in filling the larger or cheaper kinds of electric bulbs (argon [*q.v.*] is used for the smaller, more expensive ones) to prevent blackening of the bulb by volatilized metal from the filament, which can thus be run at a higher temperature. High-temperature mercury thermometers may contain compressed nitrogen. Large quantities of nitrogen are used to make synthetic ammonia and other nitrogen compounds (such as nitric acid) which are needed in the production of dyes, drugs, explosives and fertilizers.

Properties.—Nitrogen gas is only slightly soluble in water, but one volume of liquid oxygen dissolves about 450 vol. of the gas. On strong cooling under pressure, nitrogen forms a colourless liquid, boiling at −195.81°±0.02° C. (F. Henning and W. Heuse, 1924), at which temperature its specific gravity is 0.8042 g. per millilitre. The critical temperature is −147.13° C. and the critical pressure 33.49 atm. On rapid evaporation under reduced pressure the liquid freezes to a colourless solid melting at −210.5° C. under a pressure of 86 mm. The density of nitrogen gas at 0° C. and 760 mm. pressure is 1.25051 g. per litre (E. Moles and J. M. Clavera, 1924); the mean value given by several different observers is 1.25056 g. per litre at 0° C., 760 mm., and g=980.665.

The accepted value for the atomic weight is N=14.008 (O=16); the element has two stable isotopes with masses 14 and 15, enrichment in N^{15} being achieved by an exchange reaction between ammonia gas and ammonium sulphate solution. Rutherford showed that the nitrogen atom is disintegrated by the impact of swift α-particles, and protons (hydrogen nuclei) are expelled from its nucleus. Radioactive isotopes with mass numbers 13 and 16 have been formed artificially; *e.g.*, N^{13} by bombarding carbon with deuterons.

Nitrogen gas is somewhat inert, since the heat of dissociation of the nitrogen molecule into atoms is large, but it can unite directly under certain conditions with several elements, including hydrogen, oxygen, boron, silicon, lithium, magnesium, calcium, barium, titanium, vanadium, tantalum, tungsten and manganese. The compounds with metals (nitrides) may be decomposed by water under various conditions, with evolution of ammonia.

Active Nitrogen.—When a current of nitrogen gas containing a trace of oxygen or other impurity is exposed at low pressure to a high-tension electric discharge, the gas beyond the discharge glows with a yellow light and is more active chemically than ordinary nitrogen (Lord Rayleigh, 1911). It does not react with molecular hydrogen or oxygen but forms ammonia with atomic hydrogen, combines with sulphur, phosphorus and several metals, forming nitrides, decomposes nitric oxide into oxygen and nitrogen, and forms hydrocyanic acid with acetylene. The nature of this so-called active nitrogen is still uncertain, but it probably contains nitrogen atoms, both normal and excited. In a bulb coated with metaphosphoric acid, the glow persists for several hours.

The Nitrogen Cycle.—Animals derive the nitrogen of their tissue proteins partly from animal proteins and partly (sometimes

wholly) from vegetable proteins of food. Plants synthesize their proteins from inorganic compounds in the soil and to some extent from free nitrogen in the atmosphere. Daniel Berthelot found that sterilized soils do not take up nitrogen from the air, hence he concluded that microorganisms are concerned with the assimilation. These were found (S. Vinogradsky, 1895; M. W. Beijerinck, 1901) to be a *Clostridium* (*C. pasteurianum*), which is anaerobic; *i.e.*, incapable of functioning in presence of oxygen unless protected by certain bacteria, and several species of bacteria of which the most active is *Azotobacter chroococcum.* The amount of nitrogen fixed by these bacteria increases by 30% if certain Protozoa are present in the soil, although Protozoa feed on bacteria.

Atmospheric nitrogen is also fixed by the co-operative action of bacteria and certain plants, chiefly Leguminosae, such as peas, beans and clover. The parasitic bacteria are present in small nodules on the root hairs of the plants, which are grown on a large scale in order to restore the nitrogen content of soils.

Nitrogen is also fixed in the form of oxides by electrical discharges in the atmosphere, and conveyed to the soil in the form of nitric and nitrous acids by rain, these acids forming nitrates and nitrites in the soil. Altogether about 250,000 tons of nitric acid are said to be formed in this way in 24 hours. Some observations show, however, that the nitrogen content of rain does not increase during a thunderstorm. Nitrites and ammonium salts are often of little use as plant foods and must first be oxidized to nitrates by special soil bacteria, the process being known as nitrification.

Other kinds of bacteria decompose nitrogen compounds in the soil and, by this process of denitrification, return free nitrogen to the air. The combined nitrogen content of cultivated soil is generally enriched and renewed by means of nitrogenous fertilizers such as nitrates and ammonium salts.

Compounds of Nitrogen and Hydrogen.—Nitrogen forms three compounds with hydrogen, ammonia (*q.v.*), NH_3; hydrazine, N_2H_4; and hydrazoic acid or azoimide, HN_3. Ammonia and hydrazine normally function as bases and form secondary compounds, N_4H_4 and N_5H_5, respectively, with hydrazoic acid. With alkali metals, ammonia and hydrazine form compounds in which part of their hydrogen is replaced by a metal.

Hydrazine (*q.v.*), N_2H_4, with the structure $H_2N.NH_2$ (diamide), was originally obtained by T. Curtius (1887) from organic compounds containing two nitrogen atoms linked together. It is made commercially by a process devised by Friedrich Raschig (1907). Sodium hypochlorite solution is mixed with a small quantity of glue and warmed with excess of concentrated ammonia. An intermediate compound called chloramine, NH_2Cl, is formed, which reacts with the excess of ammonia to form hydrazine. After addition of sulphuric acid and cooling, hydrazine sulphate, $2N_2H_4,H_2SO_4$, crystallizes. When this is distilled under reduced pressure with concentrated potassium hydroxide solution, a colourless fuming liquid, called hydrazine hydrate, is obtained. From this, anhydrous hydrazine is obtained by distilling with solid sodium hydroxide or barium oxide (which remove water) under reduced pressure. It is a colourless liquid, boiling point 113.5° C., which freezes to a white crystalline solid, melting point 1.4° C. Hydrazine decomposes on heating, $3N_2H_4=N_2+4NH_3$, and reacts violently with halogens, forming nitrogen and halogen hydracids, $N_2H_4+2I_2=N_2+4HI$. Hydrazine rapidly destroys cork and rubber and when hot attacks glass. It is a weaker base than ammonia, forming two series of salts; *e.g.*, N_2H_4, HCl and N_2H_4, 2HCl. Hydrazine and its salts are poisonous. They are very powerful reducing agents, precipitating many metals from solutions of their salts.

Hydrazoic acid (*q.v.*), HN_3, also discovered by Curtius (1890), is formed by the action of an oxidizing agent; *e.g.*, nitric acid, on hydrazine, $3N_2H_4+5O=2HN_3+5H_2O$. The sodium salt is formed on passing nitrous oxide over heated sodamide, $NaNH_2+N_2O=NaN_3+H_2O$. Pure hydrazoic acid is a colourless liquid (boiling point 37° C., freezing point −80° C.), with a very unpleasant odour. It is very dangerously poisonous and explosive, decomposing with a blue flash on heating. The solution is acid and dissolves many metals forming salts called azides, which, especially those of the heavy metals, are explosive; lead azide (*q.v.*) is used as a detonator instead of mercury fulminate. In its action on metals hydrogen is not evolved (except a trace with magnesium), but nitrogen is, and part of the acid is reduced to ammonia. With ammonia and hydrazine it forms the colourless crystalline compounds NH_3,HN_3 (or N_4H_4) and N_2H_4,HN_3 (or N_5H_5). The group $-N_3$ in hydrazoic acid behaves like a halogen; azides give a white precipitate of AgN_3 with silver nitrate. From X-ray spectra it is shown that the three nitrogen atoms in the group are in a straight line, not, as formerly supposed, in a ring.

Oxides of Nitrogen.—The oxides of nitrogen are: nitrous oxide, N_2O; nitric oxide, NO; dinitrogen trioxide, N_2O_3; nitrogen dioxide, NO_2, and its polymer, dinitrogen tetroxide, N_2O_4; dinitrogen pentoxide, N_2O_5; and a higher oxide of uncertain formula, perhaps NO_3 or N_2O_6. They form a good example of the Law of Multiple Proportions.

Nitrous oxide, N_2O, was discovered by Joseph Priestley (1772) by exposing "nitrous air" (NO) to iron or alkali sulphides, when the gas diminished in volume and became a better supporter of combustion than common air. It was studied by Sir Humphry Davy (*q.v.*) (1799), who called it nitrous oxide and prepared it by heating ammonium nitrate, $NH_4NO_3=N_2O+2H_2O$, the method now used. He showed that it has anaesthetic properties, in some cases preceded by peculiar effects which led to its name "laughing gas." Nitrous oxide can be synthesized from its elements only with difficulty and under special conditions (D. L. Chapman, R. A. Goodman and R. T. Shepherd, 1926). It is produced by the reduction of nitric acid under certain conditions; *e.g.*, by the action of zinc on the dilute acid. In the pure state it is made by the action of hydroxylamine hydrochloride on sodium nitrite in equimolecular proportions in solution, hyponitrous acid (*q.v.*) being an intermediate product, $NH_2OH+HNO_2=N_2O+2H_2O$. It is formed in special circumstances by the oxidation of ammonia.

Nitrous oxide is a colourless gas with a pleasant sweetish odour and taste, density 1.977 g. per litre, $1\frac{1}{2}$ times that of air. At 15° C. one volume of water dissolves 0.7778 vol. of nitrous oxide, forming a neutral solution. It is more soluble in alcohol (3.268 vol. at 15° C.). Nitrous oxide supports combustion better than common air (it kindles a glowing chip, like oxygen), because it decomposes into a mixture of one volume of oxygen and two volumes of nitrogen at a fairly low temperature (beginning at 520° C.). It is an endothermic compound; *i.e.*, contains more energy than its elements and can be decomposed into oxygen and nitrogen by the explosion of a detonator. The molecule is linear, the two nitrogen atoms being adjacent. On cooling or under pressure (50 atm. at 15° C.) it forms a colourless liquid, boiling point −88.7° C., on rapid evaporation of which a white solid, melting point −102.3° C., is formed. The critical temperature is 36.5° C. and the critical pressure 71.66 atm.

The chief use of nitrous oxide is as an anaesthetic in operations of short duration, but prolonged inhalation of the pure gas causes death. About 22 l. is required to produce insensibility, and oxygen is usually administered as well. A very pure gas must be used; it is made by the decomposition of ammonia nitrate by heat, the temperature being carefully regulated to avoid the formation of ammonia and nitric oxide, and minimize the formation of nitrogen.

The gas is washed with solutions of ferrous sulphate and potassium hydroxide, and with milk of lime, and the gas is dried and liquefied by pressure in steel cylinders. One kilogram of ammonium nitrate gives 182 l. of the gas. Nitrous oxide may be used in making artificially whipped cream, being dissolved in the cream under pressure and liberated in small bubbles when the pressure is released.

Nitric oxide, NO, which is formed from its elements by the action of electric sparks or a high temperature, $N_2+O_2=2NO$, was first obtained by Jean Baptiste van Helmont about 1620, but was more carefully studied by Priestley (1772), who called it "nitrous air," and obtained it by the action of dilute nitric acid on copper or mercury, $3Cu+8HNO_3=3Cu(NO_3)_2+2NO+4H_2O$. Copper turnings and a mixture of equal volumes of nitric acid and

water may be used. The gas so prepared contains nitrogen and nitrous oxide. The pure gas is obtained by shaking a mixture of nitric acid and concentrated sulphuric acid with mercury, or by dropping a solution of potassium (or sodium) nitrite and potassium ferrocyanide into dilute acetic acid, $K_4Fe(CN)_6 + KNO_2 + 2CH_3COOH = K_3Fe(CN)_6 + NO + H_2O + 2CH_3COOK$. The colourless gas may be collected over water, or, if required pure, over mercury. It has a density of 1.3402 g. per litre, slightly greater than that of air. At 15° C., one volume of water dissolves only 0.051 vol. of the gas. It is not easily liquefied and has a boiling point of −150.2° C. and a melting point of −163.6° C. The liquid and solid are distinctly blue. The critical temperature is −96° C. and the critical pressure 64 atm. The molecule contains an odd electron in its structure, and nitric oxide is paramagnetic, its susceptibility being half that of oxygen.

Nitric oxide, although it is endothermic, is the most stable oxide of nitrogen, being dissociated into its elements only to about 3.5% at 1,000° C. Consequently, burning substances continue to burn in the gas only if they have previously attained a high temperature. A taper, burning sulphur, and feebly burning phosphorus is extinguished, but brightly burning phosphorus burns brilliantly in the gas. A mixture of nitric oxide and carbon disulphide vapour burns with a brilliant lilac-coloured light, very rich in actinic rays. Nitric oxide combines rapidly with oxygen to form the dioxide, NO_2, which appears as red fumes when nitric oxide is exposed to air. The reaction involves three molecules, $2NO + O_2 = 2NO_2$, and slows down appreciably in its later stages, so that a short time of contact is necessary for complete oxidation, and with dilute gases several minutes may be needed. This is important in technology (*see* NITROGEN, FIXATION OF). Nitric oxide dissolves to form a black liquid in cold ferrous sulphate solution, but is expelled again on warming. The best solvent is a slightly alkaline solution of sodium sulphite, when the compound $Na_2(NO)_2SO_3$ is formed. At the temperature of liquid oxygen, it reacts with fluorine to form *nitryl fluoride*, $4NO + F_2 = 2NO_2F + N_2$, a halogen derivative of nitric acid (melting point −166° C., boiling point −72.4° C.). The compounds NO_3F and NO_2Cl are also known. Nitric oxide and all higher oxides of nitrogen are poisonous.

Dinitrogen trioxide (nitrous anhydride), N_2O_3, was obtained by J. R. Glauber (1648). When nitric acid (56%) is distilled with arsenious oxide or starch, and the red vapour cooled in a freezing mixture, dark-blue liquid N_2O_3 is obtained, $2HNO_3 + As_2O_3 = N_2O_3 + H_2O + As_2O_5$. On evaporation, the liquid decomposes almost completely into nitric oxide and nitrogen dioxide, but these recombine on liquefaction by cooling: $N_2O_3 \rightleftarrows NO + NO_2$. Although the gas is mainly a mixture of nitric oxide and nitrogen dioxide, only about 2% of N_2O_3 being present at 15° C., it is absorbed by solutions of alkalies with formation of nitrites, and by concentrated sulphuric acid with formation of nitrososulphuric acid ("chamber crystals"), thus behaving as if it consisted of N_2O_3. As absorption proceeds, the equilibrium is displaced to the left in the above equation. Only traces of nitrous acid are formed by the action of water, since the acid is unstable and decomposes, partly into dinitrogen trioxide (to which the blue colour of the solution is due) and water, and partly into nitric oxide and nitric acid: $3HNO_2 = HNO_3 + 2NO + H_2O$. According to H. B. Baker and M. Baker (1900), when liquid dinitrogen trioxide is dried by long exposure to phosphorus pentoxide, the vapour formed from it consists of N_4O_6 molecules, but other workers could not repeat this experiment.

Sodium nitrite, $NaNO_2$, an important salt used in many organic preparations (*e.g.*, of dyestuffs), is now mostly manufactured by absorbing higher oxides of nitrogen formed by the oxidation of ammonia in alkali solutions. Older methods of preparation are by heating molten sodium nitrate with metallic lead, $NaNO_3 + Pb = NaNO_2 + PbO$, or by adding sulphur to fused sodium nitrate and sodium hydroxide, $3NaNO_3 + S + 2NaOH = 3NaNO_2 + Na_2SO_4 + H_2O$. Nitrites are reducing agents, forming nitrates, usually in acid solution, but they also liberate iodine from acidified potassium iodide, being reduced to nitric oxide, $2KI + 2KNO_2 + 2H_2SO_4 = 2K_2SO_4 + I_2 + 2NO + 2H_2O$.

The chloride of nitrous acid, *nitrosyl chloride*, NOCl, is a yellow gas formed by the direct combination of nitric oxide and chlorine, by the action of phosphorus pentachloride on sodium nitrite, by heating nitrososulphuric acid with sodium chloride, or (together with chlorine) by heating a mixture of concentrated nitric and hydrochloric acids (aqua regia): $HNO_3 + 3HCl = NOCl + Cl_2 + 2H_2O$. It has been used for bleaching flour.

Nitrogen dioxide, NO_2, and *dinitrogen tetroxide*, N_2O_4 (the mixture being often incorrectly called "nitrogen peroxide"), formed as a red gas by the direct union of nitric oxide and oxygen (*see* above), are usually prepared by heating dry lead nitrate, $2Pb(NO_3)_2 = 2PbO + 4NO_2 + O_2$, and condensing the red gas to a liquid in a tube cooled in a freezing mixture, the oxygen passing on. A very pure gas is made by warming nitrososulphuric acid with potassium nitrate: $SO_2(OH).O.NO + KNO_3 = KHSO_4 + 2NO_2$, or by adding fuming nitric acid and phosphorus pentoxide to liquid dinitrogen trioxide, and distilling: $N_2O_3 + N_2O_5 = 2N_2O_4$. Dinitrogen tetroxide in a good freezing mixture solidifies to nearly colourless crystals (the liquid supercools), melting at −9.04° C. to a honey-coloured liquid. Both these forms consist mainly of N_2O_4. On warming, the liquid becomes red, because of formation of nitrogen dioxide molecules, $N_2O_4 \rightleftarrows 2NO_2$, and boils at 21.9° C. to form a red vapour. On heating, the colour of the gas deepens, because of further dissociation, and at 140° C. it is nearly black, dissociation being then complete. At still higher temperatures, nitrogen dioxide dissociates into nitric oxide and oxygen, this being complete at 620° C., when the gas is colourless, $2NO_2 = 2NO + O_2$. On cooling, all these changes are reversed. Since the volume increases, the extent of dissociation may be calculated from the density of the gas. At atmospheric pressure it varies from about 15% at the boiling point to 89.3% at 100° C., and 100% at 140° C.

The gas kindles a glowing chip and supports the combustion of brightly burning phosphorus. A mixture with hydrogen is reduced to ammonia when passed over heated platinum. In contact with water, the liquid, or gas, forms nitric and nitrous acids, $2NO_2 + H_2O = HNO_3 + HNO_2$, and the nitrous acid decomposes as explained above. With ice-cold water, blue liquid dinitrogen trioxide separates.

In the absorption of nitrous fumes in water, as in the preparation of nitric acid by the oxidation of ammonia, the evolution of nitric oxide necessitates adequate oxidation space for its reoxidation to nitrogen dioxide. Alkalies absorb the gas with formation of nitrite and nitrate, $2NO_2 + 2KOH = KNO_2 + KNO_3 + H_2O$, the process being somewhat slower than in the case of dinitrogen trioxide. Liquid dinitrogen tetroxide forms a violently explosive mixture with gasoline or other hydrocarbons, which has been used for aerial bombardment. The gas diluted with air is used in bleaching flour.

Dinitrogen pentoxide (nitric anhydride), N_2O_5, discovered by E. H. Sainte-Claire Deville (1849), is best prepared by adding phosphorus pentoxide to cooled concentrated nitric acid, then distilling the product in a current of ozonized oxygen, drying the gas with phosphorus pentoxide and condensing in a receiver cooled in solid carbon dioxide and ether: $2HNO_3 + P_2O_5 = N_2O_5 + 2HPO_3$.

It is also formed by passing ozonized oxygen into cooled liquid dinitrogen tetroxide: $N_2O_4 + O_3 = N_2O_5 + O_2$. The colourless crystals are stable below 0° C., but are very hygroscopic. On warming, they melt with decomposition into nitrogen dioxide and oxygen, and also decompose on exposure to light. Rapid heating causes explosion. Phosphorus and potassium burn in the liquid on warming, and charcoal burns if previously ignited. With water, nitric acid is formed.

Trinitrogen tetroxide, N_3O_4, is said to be formed as a greenish solid by passing nitric oxide into liquid oxygen, or by the action of air on solid nitric oxide at the temperature of liquid air. It decomposes into dinitrogen trioxide and nitric oxide above the temperature of liquid air (R. L. Hasche, 1925). A higher oxide of nitrogen, perhaps NO_3 or N_2O_6, is apparently formed by the action of an electric discharge on a mixture of nitrogen and oxygen, and has a characteristic absorption spectrum.

Hyponitrous acid, $H_2N_2O_2$, with the structure $HO.N=N.OH$, is formed by the action of nitrous acid on hydroxylamine (*see* above), but is best obtained as a salt by the reduction of a solution of sodium nitrite with sodium amalgam: $2NaNO_2+4Na+2H_2O=Na_2N_2O_2+4NaOH$ (Edward Divers, 1871). The free acid is obtained in colourless crystals, which at once decompose with feeble explosion, $H_2N_2O_2=N_2O+H_2O$, by the action of dry hydrogen chloride in ether on silver hyponitrite, and evaporation at room temperature. The acid and its salts are reducing agents. An isomer of hyponitrous acid is *nitramide,* perhaps with the formula $NH_2.NO_2$. *Hyponitric acid* (nitrohydroxylamic acid), $H_2N_2O_3$, is known in the form of salts.

Nitrogen Halides.—*Nitrogen trifluoride,* NF_3, is a colourless gas, melting point −216.6° C., boiling point −119° C., formed by the electrolysis of ammonium hydrogen fluoride (O. Ruff and L. Staub, 1928). *Nitrogen trichloride,* NCl_3, is a yellow, very explosive oil, formed by the action of chlorine on ammonium chloride solution, or the action of excess of chlorine on ammonia (P. L. Dulong, 1811): $NH_3+3Cl_2=NCl_3+3HCl$. In the last reaction, two intermediate compounds are formed, viz., *monochloramine,* NH_2Cl, which has been obtained pure in colourless explosive crystals, melting point −66° C., and *dichloramine,* $NHCl_2$, known only in solution. Nitrogen trichloride boils at 71° C., but easily decomposes with violent explosion on heating. The vapour has a pungent smell and attacks the eyes and mucous membranes. The liquid explodes on exposure to bright light, and in contact with many solids. It is decomposed by ammonia. A solution in benzene is fairly stable.

The existence of *nitrogen tribromide* is doubtful. *Nitrogen iodide* was obtained by B. Courtois (1812) as a black powder by the action of ammonia solution on iodine, and drying at room temperature on filter paper. Its formula is NI_3NH_3 (F. D. Chattaway, 1900). It is very explosive, detonating when gently pressed, with evolution of violet fumes of iodine. It is an oxidizing agent. *Nitrogen tri-iodide,* NI_3, is a black powder obtained by the action of ammonia gas on potassium iodobromide, $KIBr_2$, washing with water, and drying (H. W. Cremer and D. R. Duncan, 1930). (*See* also AMMONIA; HYDRAZOIC ACID; HYDRAZINE; HYDROXYLAMINE; NITRIC ACID; NITROGEN, FIXATION OF.)

NITROGEN, FIXATION OF. The term "fixation of nitrogen" has been given to any chemical process whereby "free" nitrogen, one of the elements, is caused to combine chemically with other elements to form nitrogen compounds. The atmosphere is a great reservoir of nitrogen, this element accounting for nearly four-fifths of the volume.

Nitrogen is chemically inert, and, under ordinary conditions, does not react with other elements. A number of rather drastic processes have been discovered for "fixing" nitrogen (*i.e.,* causing it to enter into chemical combinations) but these are processes one would not expect to find operative in nature. Yet, nitrogen in combined form is found in all fertile soils, in every living thing, in many foodstuffs, in silk, wool and feathers, in coal and in such naturally occurring chemicals as saltpetre and ammonia. Fixed nitrogen is found in the basic substance of living matter, the protoplasm; it is present in the nucleus of every living cell.

During the early decades of the 19th century, Nicolas Théodore de Saussure, Jean Baptiste Boussingault, Justus von Liebig and others demonstrated that growing plants obtain their fixed nitrogen from the soil. Animals, in turn, secure their fixed nitrogen through the consumption of plants or of other animals which use plants as food. The astonishing fact was discovered, however, that when crops were removed from a field, the decrease in the fixed-nitrogen content of the soil was less than the amounts accounted for by the crop removals. Liebig rightly concluded that the fixed-nitrogen supply of the soil was replenished from the atmosphere, but he contended that the process did not involve any fixation of free atmospheric nitrogen. Since he knew that rain water always contains traces of dissolved nitrogen compounds, and that both animal and vegetable matter release ammonia during decay, Liebig postulated that the released ammonia was returned to the earth in rain water. This "ammonia cycle," from earth to atmosphere and return to earth, does occur, but it accounts for only a small part of the fixed nitrogen that the soil receives from the atmosphere. Not until 1886 was it known that certain microorganisms are able to fix atmospheric nitrogen and thus replenish the soil's supply. Of these, the most important are the *Rhizobium* genera of bacteria and the *Azotobacter.* The former are found on the roots of leguminous plants and the latter live independently in the soil. The process by which these bacteria fix nitrogen was not known at mid-20th century. It was virtually certain, however, that bacteria do not use any of the known chemical methods for the fixation of nitrogen.

Although Liebig and his contemporaries did not arrive at a correct explanation as to the source of fixed nitrogen in the soil, they did make clear the importance of fixed nitrogen in agriculture. Nitrogenous materials long had been used as fertilizers without understanding of the reason for the beneficial effects. As a result of the new knowledge, ammonia released in making coke from coal was thenceforth recovered and utilized as a fertilizer, as was sodium nitrate from the deposits discovered in Chile. Wherever agriculture was practised intensively, there developed a demand for nitrogen compounds to supplement the natural supply of the soil.

In addition to the demand for fixed nitrogen in agriculture, there were other urgent and growing needs for nitrogen compounds. The increasing quantity of saltpetre used in the manufacture of gunpowder led to a world-wide search for natural deposits of this nitrogen compound. Industrial demands and the advent of high explosives called for an ever larger supply of fixed nitrogen. By the end of the 19th century it was clear that recoveries from the coal-carbonizing industry and the importation of Chilean nitrate could not meet the future agricultural and industrial demands for nitrogen compounds. Moreover, it was obvious that in the event of a major war, a nation cut off from the Chilean supply soon would be unable to manufacture munitions in adequate amounts. The problem of fixed-nitrogen supply had become an exceedingly important one, and it appeared that the fixation of atmospheric nitrogen offered the only solution. During the final decade of the 19th century and the opening decade of the 20th century, intensive efforts culminated in the development of commercial nitrogen fixation processes.

Fixation of Nitrogen as the Oxide.—Air is essentially a mixture of one volume of oxygen with four volumes of nitrogen. Both gases are in the free, or elemental, condition and do not react with each other under ordinary conditions. If, however, air or any other mixture of oxygen and nitrogen is heated to a very high temperature, a small portion of the mixture reacts to form the gas nitric oxide. On allowing the gas mixture to cool slowly, the nitric oxide decomposes almost completely into oxygen and nitrogen. At any given temperature there exists a dynamic equilibrium among the three gases. This may be expressed chemically thus:

$$O_2+N_2 \rightleftarrows 2\,NO-43{,}200\text{ Cal.}$$

The arrows indicate that the reaction may proceed in either direction as conditions change. Although all chemical reactions are of this sort in theory, conditions are often such that the reaction proceeds almost exclusively in one direction. The chemical expression may then be written as an equation. In the reaction now under consideration, both the forward and reverse reactions must be taken into account. Change of pressure has no effect on the equilibrium, but when the temperature is increased the equilibrium shifts to the right; *i.e.,* a larger proportion of nitric oxide is formed. At ordinary temperatures practically no nitric oxide is present, but at the temperature of an electric arc a small percentage of nitric oxide is formed. Inasmuch as the nitric oxide decomposes into its elements on cooling, it would appear that an

"arc" process could not serve as a commercial method of nitrogen fixation. It can serve as a practical process, however, when advantage is taken of the rates of the reactions involved. The chemical expression given above is for an equilibrium. It reveals nothing as to the time required to establish the equilibrium. It is well known that most chemical reactions are greatly accelerated as the temperature of the reactants is increased and, conversely, are retarded as the temperature is decreased. In the present case, equilibrium is reached quickly at the very high temperature of the arc. If the mixture of gases then is cooled rapidly, the rate of the reverse reaction drops to nil; *i.e.*, the decomposition of the nitric oxide virtually ceases, and the high-temperature equilibrium is, so to speak, "frozen."

The nitric oxide does not remain long as such in the cooled gas mixture but begins to react with the free oxygen present when the temperature falls below about 600° C., thus:

$$2\ NO + O_2 \rightleftarrows 2\ NO_2.$$

The indicated reaction proceeds from left to right until nearly all the nitric oxide has been converted to the dioxide, NO_2. The latter polymerizes partially to set up another equilibrium, thus:

$$2\ NO_2 \rightleftarrows N_2O_4.$$

And, when the $NO_2-N_2O_4$ mixture is brought into contact with water, nitric acid (*q.v.*) is formed.

The foregoing facts form the basis for a practical process of nitrogen fixation.

In 1772 the English chemist, Joseph Priestley, observed that the passage of an electric spark through a small volume of air confined over water brought a decrease in gas volume, and that the water became acidic. Priestley did not interpret this result correctly and two years elapsed before the correct interpretation was given by another English chemist, Henry Cavendish. Thus was discovered what later became known as the "spark" or "arc" method of nitrogen fixation. At that time, however, electrical energy was far too costly to permit the use of such a process.

By the end of the 19th century, mechanical means of generating large quantities of electric energy had been evolved, and the use of water power to drive electric generators finally brought the cost of electric energy down to a range where nitrogen fixation by the spark or arc method became economically feasible. Many experimenters then turned attention to the problem, and by 1902 Charles S. Bradley and D. R. Lovejoy had a small plant using a spark process in operation at Niagara Falls, N.Y. This venture failed commercially, however. In 1904 Christian Birkeland of Oslo, Nor., and Samuel Eyde, an engineer, used an arc method in a small plant that was the forerunner of large and commercially successful plants. In 1908 a large arc process plant was established at Notodden, Nor.

In the Birkeland-Eyde process an electric arc was spread into a disk of flame by means of a magnetic field. Air was blown through the disk and then mixed immediately with cold air, thus "freezing" the high-temperature equilibrium.

Several modifications of the arc process were developed in the first two decades of the 20th century, and small plants were built in countries other than Norway. The arc process was, however, inherently inefficient in the use of energy, and the absorption towers required for the reaction of the nitrogen oxides with water were large and costly. Better methods of fixing nitrogen were soon discovered and the process was eventually abandoned.

In the decade 1940–50 new interest was aroused in the fixation of nitrogen as the oxide through the use of the high temperature and rapid heat exchange and heat economy possible in a "Royster stove." This piece of equipment is a modification of the heat exchange stoves long in use on blast furnaces, the essential difference being the substitution of small pieces of highly refractory material for the usual brick checkerwork in the stoves. In the process two or more Royster stoves are used. The refractory filling in one such stove is brought up to a high temperature by burning gas therein. Air is then passed through the stove and, at the high temperature prevailing, a small portion of nitric oxide is formed. The high temperature equilibrium is then "frozen" by passing the hot gas into an unheated stove. The nitric oxide in the cool gas issuing from the second stove may then be recovered.

When most of the heat in the first stove has been transferred to the second stove, the direction of air flow through the two stoves is reversed. Inasmuch as the heat transfer between the two stoves cannot be quite complete without disturbing conditions necessary in the process, one stove must be reheated occasionally with gas.

Fixation of Nitrogen as a Cyanide.—Another chemical method of fixing nitrogen was discovered about 1828 by Desfosses, who observed that potassium cyanide was formed when a stream of nitrogen was passed through a red-hot mixture of potash and carbon in an iron tube. In 1842 a small plant using the cyanide method was built in France and was operated for a few years. Many other attempts were made to find a practical process based on cyanide formation, the latest during World War I, but no commercially successful cyanide process had been adopted at mid-20th century.

Fixation of Nitrogen as a Nitride.—At high temperatures nitrogen will combine directly with some metals to form their nitrides (*q.v.*), most of which can be hydrolyzed to form the metal hydroxides and ammonia. During the decade 1909–19, unsuccessful attempts were made to apply a nitride process developed by O. Serpek in which nitrogen, aluminum oxide and carbon were heated together to form aluminum nitride.

Fixation of Nitrogen as a Cyanamide.—During the period 1895–98, Adolph Frank and Nikoden Caro conducted investigations directed toward the improvement of methods for producing cyanides. In the course of this work they discovered that crude calcium carbide and nitrogen would react at 1,000° C. to form calcium cyanamide rather than a cyanide. The chemical reaction may be written thus:

$$CaC_2 + N_2 = CaCN_2 + C.$$

Pure carbide reacts slowly, if at all, but the reaction is catalyzed by alkalies or alkaline earths. Calcium fluoride is the catalyst commonly used. Crude calcium cyanamide may be used directly as a fertilizer.

A large calcium cyanamide plant was built in Italy in 1907. Within the next five years, large plants were built in Germany, Dalmatia, France, Switzerland, Norway, Canada and Japan. The cyanamide process was the first nitrogen fixation process to be so widely used. During World War I the United States government built a very large cyanamide plant near Wilson dam, Ala.

Calcium carbide and nitrogen are the raw materials for the cyanamide process. The nitrogen may be obtained by the partial liquefaction and fractional distillation of air. The carbide is made by the heating of coke and high-grade lime in an electric furnace, the chemical reaction being:

$$CaO + 3\ C = CaC_2 + CO.$$

The carbon monoxide gas escapes from the furnace. The carbide is drawn off in molten form, cooled, ground and then heated to 1,000° C. and treated with nitrogen. The nitrifying reaction is exothermic and continues spontaneously once started. The resultant mass of crude cyanamide is cooled, ground and granulated for use as a fertilizer, or the cyanamide may be hydrolyzed and the fixed nitrogen liberated as ammonia: $CaCN_2 + 3H_2O = CaCO_3 + 2NH_3$.

The cyanamide process is an elaborate one. The electric energy required to produce the necessary carbide is relatively large per ton of fixed nitrogen finally obtained, although it is not so large as the energy required in the arc process.

The development of new manufacturing processes has been rapid during the 20th century. Within a decade after the erection of the first plant using the arc process, that process was fast becoming obsolete, and the cyanamide process was also to become obsolete within a decade after its development. Subsequent to World War I, no new cyanamide plants were built, although some of those then extant were still in operation at the beginning of World War II.

Fixation of Nitrogen as Ammonia.—The direct synthesis

of ammonia from elemental nitrogen and hydrogen has proved to be the most economical method discovered for the fixation of nitrogen. This method is being utilized in many countries and has become one of the largest and most basic processes of chemical industry the world over.

During the closing decade of the 19th century and the early years of the 20th century many investigators studied the gaseous system nitrogen-hydrogen-ammonia. Among those prominent in this work in the period 1904–08 were F. Haber, G. van Oordt, R. LeRossignol, W. Nernst, F. Jost and K. Jellinek.

The research of Haber and his associates convinced the Badische Anilin- und Sodafabrik that it was economically feasible to manufacture ammonia. The German firm then threw its great engineering and technical resources into the project and in 1910 a pilot plant was put into operation. This was the forerunner of a commercial plant which came into production in 1913 with a capacity of 7,000 tons of fixed nitrogen per year.

It was well known when Haber and his associates began their research on ammonia synthesis that no ammonia is formed when nitrogen and hydrogen are brought together under ordinary conditions of temperature and pressure. It was known that a trace of ammonia is formed when a silent electric discharge is passed through a mixture of nitrogen and hydrogen. It had also been observed that complete decomposition of ammonia cannot be effected by heat. Regardless of these clues to the existence of a true equilibrium, such as represented by the expression:

$$N_2 + 3\ H_2 \rightleftarrows 2\ NH_3 + 24{,}000\ \text{Cal.},$$

several investigators of note contended that no such equilibrium could be found. The situation was, therefore, one of confusion until Haber and his co-workers clearly demonstrated the existence of the equilibrium and measured the concentrations of the gases under several conditions of temperature and pressure.

Inasmuch as the foregoing expression of equilibrium indicates that one volume of nitrogen and three volumes of hydrogen combine to form two volumes of ammonia it follows, according to the Le Chatelier principle (*see* LE CHATELIER, HENRY LOUIS), that the higher the pressure on the system the larger the proportion of ammonia at equilibrium; that is, the equilibrium is shifted toward the smaller volume. It will be recalled that this effect of pressure is different from the case of the nitrogen-oxygen-nitric oxide equilibrium, on which a change in pressure had no effect. The effect of temperature on the equilibrium in the two cases is reversed. In the nitrogen-oxygen-nitric oxide equilibrium, the higher the temperature the larger the proportion of nitric oxide, whereas in the nitrogen-hydrogen-ammonia equilibrium the higher the temperature the smaller the proportion of ammonia.

The following table shows the effect of temperature and of pressure on the percentage of ammonia formed at equilibrium when one volume of nitrogen and three volumes of hydrogen are caused to react.

Percentage of Ammonia at Equilibrium

(Data obtained by the U.S. Fixed Nitrogen Research Laboratory)

Temperature ° C.	Pressure in atmospheres						
	10	30	50	100	300	600	1,000
200 . . .	50.66	67.56	74.38	81.54	89.94	95.37	98.29
250 . . .	28 34	47.22	56.33	67 24	81.38	90.66	96.17
300 . . .	14.73	30.25	39.41	52.04	70.96	84.21	92.55
350 . . .	7.41	17.78	25 23	37.35	59.12	75.62	87.46
400 . . .	3.85	10.15	15.27	25.12	47.00	65.20	79.82
450 . . .	2.11	5.86	9.15	16.43	35.82	53.71	69.69
500 . . .	1 21	3.49	5.56	10.61	26.44	42.15	57.47
550 . . .	0.76	2.18	3.45	6.82	19.13	31.63	41.16
600 . . .	0.49	1.39	2.26	4.52	13.77	23 10	31.43
650 . . .	0.33	0.96	1.53	3.11	9.92	16.02	20.70
700 . . .	0.23	0.68	1.05	2.18	7.28	12.60	12.87

From the foregoing table it is apparent that an ammonia synthesis process should be carried out at a temperature as low and at a pressure as high as may be practical and economical. Again, the rates of reaction toward equilibrium must be taken into account. At ordinary temperatures the rate of reaction is virtually zero and is negligibly low even at 500° C. unless a catalyst is used. Obviously, the use of a catalyst in ammonia synthesis is extremely important in permitting the reaction to be carried out at a lower temperature than would be practical with no catalyst. In commercial plants temperatures in the range 450° C. to 500° C. are used. The best catalyst known is prepared from pure iron plus small proportions of alumina and potash.

The decision as to the pressure at which to carry out the ammonia synthesis is an economic matter. Plants have been built to operate at pressures as low as 100 atm. and as high as 1,000 atm., but most of the plants use pressures in the range 200 to 350 atm.

Steps in the Synthetic Ammonia Process.—Four major steps are involved in the synthetic ammonia process as it is carried out in large commercial plants. The initial step comprises the preparation of nitrogen and hydrogen or a mixture of these two gases. Where natural gas is available at relatively low cost, this material is used as a source of hydrogen. Most of the plants, however, use air, steam and coke to obtain a mixture of nitrogen and hydrogen along with carbon monoxide, carbon dioxide and other impurities. This mixture is then further processed with steam to convert most of the carbon monoxide to hydrogen and carbon dioxide. A few plants obtain hydrogen through the electrolysis of water, and a few others use coke oven gas as a source of hydrogen. In all plants, the necessary nitrogen is obtained from air.

In the second step of the process, the gas mixture is compressed and then freed from undesired gases by means of an elaborate system of equipment, leaving a purified mixture of nitrogen and hydrogen in the correct proportion for the ammonia synthesis.

In the third major step the nitrogen-hydrogen mixture is passed through a bed of catalyst at a temperature of about 500° C. and at a pressure from 100 to 1,000 atm. Some ammonia is thus formed, the proportion depending on the temperature and pressure used, the activity of the catalyst and time of contact of the gases with the catalyst.

In the fourth and final step, the ammonia is removed, usually by refrigeration. That part of gas mixture which remains uncombined is then recycled through the catalyst bed after the addition of sufficient fresh nitrogen-hydrogen mixture to compensate for the ammonia removed from the system.

Although the synthetic ammonia process may seem to be one of relative simplicity, it actually represents engineering achievement in the usage of materials and in construction unknown before the 20th century. Nevertheless, the process assures ample supplies of ammonia, which has become the cheapest form of fixed nitrogen available to industry and to agriculture, and is the raw material from which numerous nitrogenous chemicals are manufactured.

The success of the synthetic ammonia plants built in Germany during World War I, led to a rapid expansion of the industry and the construction of plants in many countries other than Germany. The initial plant at Oppau, Ger., was expanded to a capacity of 120,000 tons per year during World War I and a second large plant built at Leuna, near Merseburg, Ger. Various modifications of the original Haber or Haber-Bosch process were devised, such as the Claude process in France, the Casale process in Italy, the American and the Nitrogen Engineering processes in the United States. During World War II, ten new synthetic ammonia plants were built in the U.S. to meet an anticipated demand for ammonia in the production of munitions. The output of some of these plants was diverted to the production of agricultural fertilizer in the form of ammonium nitrate. At the close of World War II, most of the German synthetic ammonia plants lay in ruins; the United States had become the world leader in ammonia production, with a fixed nitrogen capacity of more than 1,000,000 tons per year.

NITROGEN HARDENING, a process for the surface hardening of steel more commonly known as nitriding. It consists of heating special alloy steels in contact with ammonia at temperatures below the transformation range for steels, usually between 950° F. and 1,050° F., for periods of from 5 to 100 hrs., depending upon the depth of case desired. The steels used must contain nitriding-forming elements (such as aluminum, chromium or molybdenum) dissolved in the iron. During the nitriding cycle, nitrogen from the ammonia diffuses into the steel and forms alloy nitrides, which are precipitated along the crystal planes of the iron. This precipitation causes an increase in hardness, which is dependent upon temperature and the amount and nature of the nitride-forming elements in the steel. Aluminum is the most effective hardening element. A steel containing approximately 1% aluminum and 1% chromium nitrided at 975° F. will have a surface hardness of approximately 1,100 Vickers-Brinell.

The advantages of nitriding compared with other methods of surface hardening are as follows: (1) a much harder and more wear-resistant case is produced; (2) distortion is low primarily because the process is carried out below the transformation range; and (3) the resistance to fatigue failures, particularly notch fatigue, is greatly increased because nitriding results in surface compressive stresses which resist crack formation. The disadvantages of the process are: (1) an alloy steel must be used, which is more expensive than plain carbon steels; and (2) the time required to produce a case is long compared with other methods of surface hardening such as carburizing, cyaniding or induction hardening. (C. F. F.)

NITROGLYCERIN, an explosive first obtained in 1846 by A. Sobrero by treating glycerol (*see* GLYCERINE) with a mixture of concentrated nitric and sulphuric acids at ordinary temperature.

This reaction is strongly exothermic, and precautions must be taken that it does not get out of control, particularly in large-scale operations. Nitroglycerin is an ester of nitric acid, having the systematic name of glyceryl trinitrate and the formula is $CH_2(ONO_2)$-$CH(ONO_2)$-$CH_2(ONO_2)$.

It is an oily substance which is colourless when pure, but which is usually of a pale yellow colour, of specific gravity 1.60 at 15° C. Its melting point is 13.2° C., but the liquid is easily supercooled. Nitroglycerin is scarcely soluble in water and in glycerol, fairly soluble in ethyl and methyl alcohols and is miscible in all proportions with ether, acetone, benzene, etc. It dissolves and swells nitrocellulose and is therefore used as an ingredient in double-base propellants. It is used either alone or in mixtures with other ingredients as an explosive. Liquid nitroglycerin is extremely sensitive to shock and should be regarded as a hazardous substance. Evidence as to whether crystalline nitroglycerin is less or more hazardous is conflicting. However, for the prevention of freezing of nitroglycerin on storage in cold places, more use is being made of the so-called "low-freezing" nitroglycerin, which is obtained by nitration of partly polymerized glycerol or of glycerol mixed with other polyhydric alcohols.

Therapeutics.—Nitroglycerin has a sweet burning taste and is somewhat poisonous. Its vapour produces violent headache but most persons become accustomed to nitroglycerin after periods of weeks or months, and the headaches disappear thereafter. Although a nitrate, its pharmacological actions when it is taken internally resemble those of nitrites such as amyl nitrite. The explanation is that, in an alkaline medium at body temperature, nitroglycerin yields a nitrite, probably as a preliminary stage of decomposition. This gradual conversion in the tissues is a valuable property of nitroglycerin, since its effects take longer to disappear than is the case with amyl and other nitrites. Nitroglycerin is administered as a preventive in cases of cardiac pain, such as angina pectoris. (*See* EXPLOSIVES; PROPELLANTS.)

BIBLIOGRAPHY.—P. Naoúm, *Nitroglycerine and Nitroglycerine Explosives,* Eng. trans. by E. M. Symmes (1928); Sir Thomas Edward Thorpe, *Dictionary of Applied Chemistry,* 5 vol., 4th ed. (1939–42).
(G. B. K.)

NITROSOBENZENE, C_6H_5NO, first obtained by the action of nitrosyl bromide or chloride on mercury diphenyl, is prepared by the oxidation of β-phenylhydroxylamine with chromic acid. It results from the oxidation of aniline by monopersulphuric acid (H. Caro). It forms colourless crystals which melt at 68° C. to an emerald-green liquid. It is very volatile, and its vapour and solutions are green. The colour changes which nitrosobenzene exhibits are explained by the fact that in the solid state, in which it is colourless, it exists in the form of dimeric molecules $(C_6H_5NO)_2$; whereas, in the liquid and vapour states, in which it is green, it has the monomeric form C_6H_5NO.

NITTI, FRANCESCO SAVERIO (1868–1953), Italian statesman, was born at Melfi (Potenza). He was already known as a barrister and as professor of financial science at the University of Naples when he entered parliament in 1904. He made his reputation as an authority on economic and financial questions, and was minister of agriculture, industry and trade in the Giolitti cabinet of 1911–14. When the United States entered World War I in 1917, he was entrusted with an economic mission to that country, and certain of his utterances and acts in this connection were severely criticized. He became minister of the treasury in the Orlando cabinet from Oct. 1917 to Jan. 1919. On the fall of the Orlando ministry, which he helped to bring about in June 1919, he succeeded as premier. Nitti's adoption of the system of proportional representation resulted in an important increase in the Socialist and Popolari deputies at the elections of Nov. 1919, but he failed to conciliate either group. An epidemic of strikes and disorders seriously weakened his position, and he felt forced to resign on March 12, 1920. But no other statesman being willing to assume the succession, he reconstructed his cabinet; defeated in the chamber of deputies after the San Remo meeting of the supreme council presided over by him, to prepare the peace with Turkey, he resigned a second time but again reconstructed his cabinet. The arrest ordered by him of the Dalmatians and Fiumani in Rome provoked further irritation. He resigned for the last time on June 9, 1920, leaving the door open for Giovanni Giolitti's return. On retiring from office he returned to journalism. In parliament he opposed Giolitti, splitting the democratic forces, which helped fascism. Nitti was re-elected in 1921, but did not stand in the 1924 elections held under Benito Mussolini's auspices. He lived abroad after the advent of fascism in Italy, returning to Italy after World War II. He was a member of the *assemblea nazionale,* 1946–48, and in 1948 became a member of the Italian senate. He died in Rome on Feb. 20, 1953.

Nitti wrote several books on economic questions, including one entitled *Nord e Sud* (1900), dealing with what he regarded as the unfair treatment of south Italy by the wealthier north, and *L'Italia all' alba del secolo XX.* (1901). His other works include: *L'Europa senza pace* (Eng. trans., 1922); *La Decadenza dell' Europa* (Eng. trans., 1923); *La Tragedia dell' Europa* (Eng. trans., *They Make a Desert,* 1924); *Meditazioni dell' Esilio* (1947); and *Rivelazioni* (1948). In 1925 his son Vincenzo Nitti published a vindication of his father's policy, *L'Opera di Nitti.*

NITZSCH, KARL IMMANUEL (1787–1868), Lutheran divine, was born near Leipzig on Sept. 21, 1787. He studied at Wittenberg, where he began to teach in 1809. From 1820 to 1822 he was superintendent in Kemberg, and in the latter year he was appointed professor of theology at Bonn, where he remained until called to succeed Philip Marheineke at Berlin in 1847. Subsequently he became university preacher, rector of the university, provost of St. Nicolai (in 1854) and member of the supreme council of the church, in which last capacity he was one of the ablest and most active promoters of the Evangelical union. He died on Aug. 21, 1868. He represented the *Vermittelungstheologie* of the school of Friedrich Schleiermacher, holding "that religion is not doctrine but life, direct consciousness, feeling."

His principal works are: *System der christlichen Lehre* (1829; 6th ed., 1851; Eng. trans., 1849), *Praktische Theologie* (1847–60; 2nd ed., 1863–68). *Akademische Vorträge über christliche Glaubenslehre* (1858) and several series of *Predigten.*

NIUÉ (SAVAGE ISLAND): *see* PACIFIC ISLANDS.

NIVELLE, ROBERT GEORGE (1856–1924), French soldier, was born on Oct. 15, 1856, at Tulle, Corrèze. He entered the Polytechnic in 1876, and left two years later to join the artillery. He served in China in 1900, and then for many years in Algeria. When World War I broke out, he was in command of the 5th artillery at Besançon.

Appointed a general of brigade on Oct. 24, 1914, he fought successfully on the Aisne, and in Jan. 1915 took a prominent part in the attack on Quesnevières. On Dec. 23, 1915, he was placed at the head of the 3rd corps, and in March 1916 was sent to Verdun, where after some remarkable fighting he succeeded in checking the crown prince's first attack. On May 2 he succeeded Gen. Henri Pétain in the command of the 2nd army, and definitely held the enemy before that glorious citadel. It was he who, in orders which have become famous, made the unforgettable declaration: "Ils ne passeront pas." On Dec. 12, 1916, he succeeded Gen. Joseph Joffre as commander in chief of the armies of the north and northeast. In conjunction with the British armies he prepared the great offensive of April 16, 1917, between Soissons and Auberive. After this semidefeat he was replaced by General Pétain in the command of the French armies. On May 15, 1917, he was appointed commander of the armies *chargé de mission,* and on Dec. 23, 1917, took over the French troops in North Africa.

On Oct. 14, 1918, General Nivelle was confirmed in his command despite the rules of superannuation, and on Jan. 30, 1920, was nominated a member of the supreme war council. On March 5, 1920, he gave up the command of the 19th corps, and in Nov. 1920 he was ordered to represent France in the United States at the tercentenary of the arrival of the "Mayflower." He was placed on the retired list on Oct. 11, 1921; he died on March 23, 1924. (M. GU.)

NIVELLES (Flem. *Nÿvel*), town, province of Brabant, Belgium, on the Thines 19 mi. S. of Brussels. Pop. (1947) 11,929.

It manufactures parchment, cardboard and paper. The town is supposed to owe its origin to the foundation of a convent by Itta or Iduberge, wife of Pippin of Landen, and it is the cradle of the Carlovingians. The Romanesque church of St. Gertrude, named after Itta's daughter, dates from the 11th century. On the top of the tower is the effigy of a man in iron who strikes the hours with a hammer. He is called by the townspeople Jean de Nivelles, a celebrated baron of the 15th century whose title eventually became merged in that of the count de Hornes (Horn). Close to Nivelles is Seneffe, where Condé defeated William of Orange in 1674. At Nivelles the French under Marceau defeated the Austrians in 1794.

NIVERNAIS, an old province of France, bounded by Berry, Burgundy, Auxerrois and Gâtinais. Part of the territory of the Aedui before the Roman conquest, Nivernais was, from the end of the Carolingian period, perpetually coveted by the dukes of Burgundy (*see* NEVERS). The first Valois duke of Burgundy, Philip the Bold, became master of it thanks to an inheritance from his father-in-law, Louis of Mâle. After Charles the Bold's death, it became a province and a duchy of the kingdom of France, included in the jurisdiction of the *parlement* of Paris and was a *gouvernement militaire.* After the French Revolution it was embodied almost entirely in the department of Nièvre.

See A. Massé, *Histoire du Nivernais* (Paris, 1938). (M. PAC.)

NIXIE, or NIXY, a female water sprite. The word is adapted from Ger. *Nixe,* the male water sprite being *Nix.* The general term for both the male and female is "nicker," a kelpie. This also appears in Dutch *nikker.* The Old Teutonic *nikus* may be connected with the root which is in Gr. *νίζειν* or *νίπτειν*, "to wash."

NIXON, RICHARD MILHOUS (1913-), U.S. lawyer and politician, was born at Yorba Linda, Calif., Jan. 9, 1913. Educated in the public schools, he graduated from Whittier (Calif.) college (A.B. 1934) and Duke university law school (LL.B. 1937). He practised law in Whittier (1937–42) and in 1939 became a member of the Whittier college board of trustees. He served as attorney in the office of emergency management, Washington, D.C., Jan.–Aug. 1942. He went on active duty with the U.S. navy in August, resigning his commission as lieutenant commander, Jan. 1946. He was elected as a representative to the 80th congress, Nov. 5, 1946, and re-elected to the 81st congress, Nov. 2, 1948. In 1947 he helped draft the Taft-Hartley bill, and with Rep. Karl Mundt of South Dakota sponsored the subversive activities control bill in an attempt to curb undercover communist activities in the U.S. He was associated with the citation for contempt of congress of Gerhard Eisler and conducted an inquiry into communism in Hollywood, Calif. In 1948 he was instrumental, as a member of the un-American activities committee, in sending Alger Hiss to prison for perjury. He was appointed U.S. senator from California on Dec. 1, 1950, by Gov. Earl Warren. In July 1952 he was chosen vice-presidential nominee at the Republican national convention at Chicago, Ill., as the running mate of Dwight D. Eisenhower. The Eisenhower-Nixon ticket won decisively in the national election of Nov. 4, 1952.

NIZĀMĪ (1140–1—1202–3). Nizām-uddīn Abū Mohammed Ilyās bin Yūsuf, Persian poet, was born A.H. 535 (A.D. 1140–1). His native place, or at any rate the abode of his father, was in the hills of Kum, but as he spent almost all his days in Ganja in Arrān (the present Elizavetpol) he is generally known as Nizāmī of Ganja or Ganjawī. Nizāmī abandoned himself at an early age to a stern ascetic life, as full of intolerance to others as dry and unprofitable to himself. The first poetical work in which Nizāmī embodied his thoughts on God and man, and all the experiences he had gained, was *Makhzanul Asrār* (*c.* 1165–6) or "Storehouse of Mysteries," and bears the unmistakable stamp of Sūfic speculations. His claim to the title of the earliest Persian romanticist he fully established only a year or two after the *Makhzan* by the publication of his first epic masterpiece *Khosrau and Shīrīn* (*c.* 1175–6), reciting the ancient tale of the loves of Chosroes and Shīrīn. It was composed, according to the oldest copies, in A.H. 576 (A.D. 1180), and inscribed to the reigning atābeg of Azerbaijān, Abū Ja'far Mohammed Pahlavān, and his brother Kizil Arslān, who, soon after his accession to the throne in A.H. 582, showed his gratitude to the poet by summoning him to his court, loading him with honours, and bestowing upon him the revenue of two villages, Hamd and Nijān. In 1188 Nizāmī completed his *Dīwān*, or collection of kasīdas and ghazals (mostly of an ethical and parenetic character), which are said to have numbered 20,000 distichs, although the few copies which have come to us contain only a very small number of verses. About the same time he commenced, at the desire of the ruler of the neighbouring Shīrvān, his second romantic poem, the famous Bedouin love-story of *Laila and Majnūn* (*c.* 1188–9). His *Iskandarnāma* (1191) or "Book of Alexander," also called *Sharafnāma* or *Iqbālnāma-i-Iskandarī* ("The Fortunes of Alexander"), is split into two divisions, the first based on the historical career of Alexander, which is embroidered by many magical tales, among others the voyage of Alexander to the fountain of life in the land of darkness; the second describing him as prophet and philosopher. Nizāmī's last romance *Haft Paikar* (1198–9), or the "Seven Beauties," comprises seven tales in verses related by the seven favourite wives of the Sassānian king Bahrāmgūr. Among these is the tale of the Russian princess used by Gozzi and Schiller, "Turandot." The five mathnawīs, from the *Makhzan* to the *Haft Paikar,* form Nizāmī's so-called "Quintuple" (*Khamsa*) or "Five Treasures" (*Panj Ganj*), and have been taken as pattern by all the later epic poets in the Persian, Turkish, Chaghatāi and Hindustānī languages. Nizāmī died at Ganja in his sixty-fourth year, A.H. 599 (A.D. 1202–3).

BIBLIOGRAPHY.—The fullest account of Nizāmī is given in Dr. W. Bacher's *Nizāmī's Leben und Werke* (Leipzig, 1871; English translation by S. Robinson, London, 1873; reprinted in the same author's *Persian Poetry for English Readers,* 1883, pp. 103–244). All the errors of detail in Bacher's work have been corrected by Dr. Rieu in his *Catalogue of the Persian MSS. in the British Museum* (1881), ii. 563 *sqq.*

Principal Editions.—The whole *Khamsa* (lithographed, Bombay, 1834 and 1838, Teheran, 1845); *Makhzan-ul Asrār* (edit. by N. Bland, London, 1844, lithographed, Cawnpore, 1869, English translation in ms. by Hatton Hindley, in the British Museum Add. 6961); *Khosrau and Shīrīn* (lithographed, Lahore, 1871, German translation by Hammer in *Shīrīn, ein persisches romantisches Gedicht,* Leipzig, 1809); *Laila and Majnūn* (lithographed, Lucknow, 1879; English translation by J. Atkinson, London, 1836); *Haft Paikar* (lithographed, Bombay, 1849, Lucknow, 1873; the fourth tale in German by F. von Erdmann, *Behramgur und die russische Fürstentochter,* Kasan, 1844); *Iskandarnāma,* first part, with commentary (Calcutta, 1812 and 1825, text alone, Calcutta 1853, lithographed with marginal notes, Lucknow, 1865, Bombay, 1861 and 1875, English translation by H. Wilberforce Clarke, London, 1881; compare also Erdmann, *De expeditione Russorum Berdaam versus,* Kasan, 1826, and Charmoy, *Expédition d'Alexandre contre les Russes,* St. Petersburg, 1829); *Iskandarnāma-i-Bahrī,* second part, edited by Dr. Sprenger (Calcutta, 1852 and 1869).

NIZHEGOROD (now GORKY; the name Nizhegorod is an abbreviation from Nijni-Novgorod), a region of the Russian S.F.S.R., bounded on the east by Kirov region and the Marii, Chuvash and Mordovia Autonomous Soviet Socialist republics, on the south by Ryazan region, on the west by the Ivanovo and Yaroslavl regions, and on the north by Vologda region. Area 34,440 sq.mi. Pop. (1939) 3,876,274; urban 1,218,900, rural 2,657,374. The northern portion consists of a pine forest area lying along each side of the Vetluga river from the point where it curves sharply to the south, though the lower course of the Vetluga, and its junction with the Volga, lie in the Marii republic. The forest approaches the left bank closely, but along the right bank there are a series of settlements in the forest-free strip.

South of the Volga is a fertile black earth area, between the Oka on the west, which forms the boundary of the region in the southwest and then flows through the former province of Vladimir, finally turning sharply to the east and flowing through the Gorky region to its junction with the Volga, and the Sura on the east, which flows through the Chuvash republic in the south, but forms the boundary between that republic and the Gorky region in the north of its course. This southern part has little forest and consists of high plains, with river valleys entrenching them, and the valley black earth is the most fertile soil in the entire area of the region.

The southern part is not favourable to grass and meadow cultivation, so that dairying has not developed. Grain cultivation occupies 85% of the ploughed land, the chief crops being rye and oats, with a little wheat, millet and buckwheat. Potatoes, flax

and a little hemp are grown. Fruit and vegetables are cultivated along the Oka and Volga and find a ready market in Gorky (Nijni-Novgorod). Sheep, cattle, horses, pigs and goats are raised. The region is sparsely peopled, especially in the north; the population is mainly Great Russian, though there are Mordvinian and Tatar colonies in the southeast. Bog iron ores, sand, salt and phosphorite are found. The region is rich in peat, and the electric station opened in 1925–26 at Balakhna, on the Volga, north of Gorky, works on peat fuel and has a power of 20,000 kw.

Factory industries include the making of machinery for railway and river transport, and for local peasant industries, flour milling, distilling, sawmilling and the manufacture of cardboard and paper, brewing and the making of eather goods. The poor guarantee for agriculture has led to a great development of koustar (peasant) industry, especially the making of wooden articles (41%) and textiles, including woollen goods and felt (30%). Special peasant industries are wooden spoons in Semenov, cutlery and locks in Gorbatov, spindles in Balakhna, fancy boxes in Makaryev, and furs and leather goods.

NIZHNI TAGIL (NIZHNE-TAGILSK, TAGIL), a city of the Russian S.F.S.R., in the Sverdlovsk region, in 57° 27′ N., 59° 54′ E. Pop. (1939) 159,864. It lies in a valley on the eastern slope of the Ural mountains, within a few miles of the place where the Tagil escapes to the lowlands to join the Tura, a tributary of the Tobol. The southern part of this valley is occupied by the upper Tagil, and its northern portion by the upper Tura, from which the Tagil is separated by a low watershed. The town is connected by railway (the first in Siberia) with Perm and Sverdlovsk, and with mines to the east and west. It was founded in 1725 by the Russian mine-owner Demidov. Nizhni Tagil is a central foundry for iron mines and other works. Gold, platinum and copper are mined at Nizhni Tagil, and there is a brick-making industry. Wagon works with an output of 5,000 wagons per annum have been under construction.

NIZHNIY NOVGOROD: *see* NIJNI-NOVGOROD.

NOAH appears in Genesis v. 29 as son of Lamech and tenth in descent from Adam. The hazardous attempt of the verse to find an etymology for the name in the Hebrew verb "comfort" is an extract from another tradition, and views Noah as repairing in some measure by his discovery of vine-culture, Gen. ix. 20, the disaster of the curse pronounced upon the ground by Yahweh in consequence of the Fall. The story of the Deluge has Noah for its hero. He is represented as the patriarch who, because of his blameless piety, was chosen by God to perpetuate the human race after his wicked contemporaries had perished in the Flood. He receives a divine warning of the impending disaster, and is instructed to build an ark, in which he and his family are preserved alive. In accordance with God's instructions Noah took into the ark specimens of all animals, from which the stocks might be replenished. The story has close affinities with Babylonian traditions, in which Ut-napishtim plays the part corresponding to that of Noah (*see* DELUGE). The narrative of Gen. ix. 18–27 belongs to a different cycle, which seems to know nothing of the Flood story. In the latter Noah's sons are married, and their wives accompany them in the ark; but in this narrative they would seem to be unmarried, living in the tent with their father; nor does the shameless drunkenness of Noah accord well with the character of the pious hero of the Flood story. Three different motives may be traced in Gen. ix. 18–27: first the passage explains to whom agriculture, and in particular the culture of the vine, was due; secondly it attempts to provide in the persons of Noah's three sons, Shem, Ham and Japheth, ancestors for three of the races of mankind, and to account in some degree for their historic relations; in the third place, by its censure of Ham—for whom it is almost certain that Canaan stood in the original text—it reprobates the licentious Canaanite civilization.

(W. L. W.)

NOAILLES, the name of a great French family, derived from the castle of Noailles in the territory of Ayen, between Brive and Turenne in the Limousin, and claiming to date back to the 11th century. In the 16th century, its head, ANTOINE de Noailles (1504–1562), became admiral of France, and was ambassador in England during three important years, 1553–1556, maintaining a gallant but unsuccessful rivalry with the Spanish ambassador, Simon Renard. HENRI (1554–1623), son of Antoine, was a commander in the religious wars, and was made comte d'Ayen by Henry IV. in 1593. ANNE (d. 1678), the grandson of the first count, played an important part in the Fronde and the early years of the reign of Louis XIV., became captain-general of the newly won province of Roussillon, and in 1663 was made duc d'Ayen, and peer of France.

ADRIEN MAURICE (1678–1766), the third duke, served in the wars of Louis XV. in Italy and Germany, and became a marshal in 1734. In the war of the Austrian succession he was beaten by the English at the battle of Dettingen in 1743. He married Françoise d'Aubigné, a niece of Madame de Maintenon, and two of his sons became marshals of France. The elder, LOUIS (1713–1793), who bore the title of duc d'Ayen till his father's death in 1766, when he became duc de Noailles, served in most of the wars of the 18th century, and was made a marshal in 1775. He refused to emigrate during the Revolution and died in Aug. 1793, before the Terror reached its height. On the 4th Thermidor (July 22) the aged duchesse de Noailles was executed with her daughter-in-law, the duchesse d'Ayen, and her granddaughter, the vicomtesse de Noailles. JEAN PAUL FRANÇOIS (1739–1824), the fifth duke, was in the army, but his tastes were scientific, and for his eminence as a chemist he was elected a member of the Academy of Sciences in 1777. He became duc d'Ayen in 1766 on his grandfather's death, and duc de Noailles on his father's in 1793. He lived in Switzerland from 1792 until the Restoration in 1814, when he took his seat as a peer of France.

One other branch of the family deserves notice. PHILIPPE (1715–1794), comte de Noailles, afterwards duc de Mouchy, a younger brother of the fourth duke, served at Minden and in other campaigns, and was made a marshal on the same day as his brother. He was long in great favour at court, and his wife was first lady of honour to Marie Antoinette, and was nicknamed by her Madame Étiquette. This court favour brought down punishment in the days of the Revolution, and the old marshal and his wife were guillotined on June 27, 1794.

PHILIPPE LOUIS MARC ANTOINE, duke of Noailles and prince of Poix (1752–1819), was born on Nov. 21, 1752. In 1789 he was elected deputy of the States-General by the nobility of the *bailliages* of Amiens and Ham, but was compelled to resign in consequence of a duel with the commander of the Garde Nationale at Versailles. He left the country but returned and took part in the revolution of Aug. 10, 1792, after which he again escaped until 1800. At the Restoration he was brought again into favour and became a peer of France. He died at Paris on Feb. 17, 1819.

LOUIS MARIE (1756–1804), vicomte de Noailles, was the second son of the marshal. He served brilliantly under La Fayette in America, and concluded the capitulation of Yorktown. He was elected to the states-general in 1789. He began the famous "orgie," as Mirabeau called it, on Aug. 4, when all privileges were abolished, and with d'Aiguillon proposed the abolition of titles and liveries in June 1790. When the Revolution became more pronounced he emigrated to America. He accepted a command against the English in San Domingo, under Rochambeau. He made a brilliant defence of the mole St. Nicholas, and escaped with the garrison to Cuba; but in making for Havana his ship was attacked by an English frigate, and after a long engagement he was severely wounded, and died on Jan. 9, 1804.

NOAKHALI, a district and town of British India, in the Chittagong division of eastern Bengal province. The town (pop. [1941] 18,575), also known as Sudharam, is on a small river channel 10 mi. from the sea. The DISTRICT OF NOAKHALI has an area of 1,658 sq.mi.; pop. (1941) 2,217,402. It consists of an alluvial tract of mainland and several islands at the mouth of the Meghna. In general, every homestead is surrounded by a thick grove of betel and coconut palms. Rice is the staple of cultivation. The district is fertile and is under continuous cultivation. The delta was swept by a storm wave on Oct. 31, 1876, and about 100,000 lives were lost. The district is served by the Assam-Bengal railway.

NOBEL, ALFRED BERNHARD (1833–1896), Swedish chemist and engineer, was born at Stockholm on Oct. 21, 1833. He spent only two terms in school and thereafter was taught by tutors. About 1850 he was sent on travels to complete his education as an engineer and spent about a year in the United States. He fought against sickness all his life. On his return to Sweden after a stay in St. Petersburg he devoted himself to the study of explosives, and especially to nitroglycerin. He found that when that body was incorporated with an absorbent, inert substance like *kieselguhr* it could be safely used. In 1867 he was granted a British patent for dynamite and in 1868 a U.S. patent. Nobel next combined nitroglycerin with another high explosive, guncotton, and obtained a transparent, jellylike substance which was a still more powerful explosive than dynamite. Blasting gelatin, as it was called, was patented in 1876. It combined the high power of nitroglycerin with the comparative safety in handling of dynamite. About 13 years later Nobel produced ballistite, one of the earliest of the nitroglycerin smokeless powders and a precursor of cordite. Nobel's claim that his patent covered the latter was the occasion of vigorously contested lawsuits between him and the British government in 1894 and 1895; the question was complicated, but eventually the courts decided against Nobel. He resented the verdict since he felt that it was unjust.

An accomplishment of importance equal to that of his explosives was his construction and perfection of detonators for such explosives as could not be made to explode by simple firing. His detonators contained fulminate of mercury. These detonators make it possible to set off the explosive energy of nitroglycerin, guncotton, etc., at will; without detonators such explosives could not be used at all. From the manufacture of dynamite and other explosives, and from the exploitation of the Baku oil fields, he amassed an immense fortune. He never married. He was lonely and this together with his ill health imbued him with pessimism and a satirical view of mankind which was nevertheless combined with benevolence and belief in the future of humanity. At his death on Dec. 10, 1896, at San Remo, Italy, he left the bulk of his fortune in trust to establish five prizes (*see* NOBEL PRIZES).

NOBEL PRIZES. These prizes, five in number, are awarded annually from the Nobel foundation, a fund established under the will of Alfred Bernhard Nobel (*q.v.*). Distribution was begun on Dec. 10, 1901, the fifth anniversary of the founder's death. The awards are in the fields of physics, chemistry, physiology or medicine, literature and peace. Each consists of a gold medal, a diploma bearing a citation, and a sum of money approximating $33,000, the amount being dependent upon the income of the foundation. The prize may be divided among two or three recipients. Any prize may be withheld for one year or longer and when not distributed its amount reverts to the main fund, or to special reserves for each section. The peace prize has been reserved most frequently and special Nobel institutes have been created with the surplus funds. The Nobel prizes are open to all nationalities and are not competitive. Candidates are nominated by the following agencies: physics and chemistry by the Royal Academy of Sciences in Stockholm, Swed.; physiology or medicine by the Caroline Medical institute in Stockholm; literature by the Swedish Academy of Literature in Stockholm and the academies of France and of Spain; peace by a committee of five elected by the Norwegian *storting* (parliament).

WINNERS OF NOBEL PRIZES

(Asterisks denote contributors to *Encyclopædia Britannica*)

Physics

1901	Wilhelm Konrad Röntgen	1845–1923	(German)	Discovery of X-rays
1902	Hendrik Antoon Lorentz	1853–1928	(Dutch)	Influence of magnetism on the phenomena of radiation
	Pieter Zeeman	1865–1943	(Dutch)	
1903	Henri Becquerel	1852–1908	(French)	Discovery of the radioactive elements of radium and polonium
	Pierre Curie	1859–1906	(French)	
	Marie Curie	1867–1934	(French) (born Poland)	
1904	Baron Rayleigh*	1842–1919	(English)	Discovery of argon
1905	Philipp Lenard	1862–1947	(German)	Research in cathode rays
1906	Sir Joseph John Thomson*	1856–1940	(English)	Conduction of electricity through gases
1907	Albert A. Michelson*	1852–1931	(U.S.)	Spectroscopic and metrologic investigations
1908	Gabriel Lippmann	1845–1921	(French)	Photographic reproduction of colours
1909	Guglielmo Marconi	1874–1937	(Italian)	Development of wireless telegraphy
	Karl Ferdinand Braun	1850–1918	(German)	
1910	Johannes Diderik van der Waals	1837–1923	(Dutch)	Equations of conditions of gases and fluids
1911	Wilhelm Wien	1864–1928	(German)	Laws of heat radiation
1912	Nils Gustaf Dalén	1869–1937	(Swedish)	Coast lighting
1913	Heike Kamerlingh-Onnes	1853–1926	(Dutch)	Properties of matter at low temperatures; production of liquid helium
1914	Max von Laue	1879–	(German)	Diffraction of X-rays in crystals
1915	Sir William Henry Bragg	1862–1942	(English)	Study of crystal structure by means of X-rays
	William Lawrence Bragg	1890–	(English—his son)	
1916	(No award)			
1917	Charles Glover Barkla	1877–1944	(English)	Discovery of the characteristic Röntgen radiation of the elements
1918	Max Planck	1858–1947	(German)	Discovery of the elemental quantum
1919	Johannes Stark	1874–	(German)	Discovery of the Doppler effect in canal rays and the division of spectral lines in the electric field
1920	Charles Edouard Guillaume	1861–1938	(Swiss)	Discovery of the anomalies of nickel-steel alloys
1921	Albert Einstein*	1879–	(German)	Founder of theory of relativity and discoverer of law of photoelectric effect
1922	Niels Bohr*	1885–	(Danish)	Study of structure and radiations of atoms
1923	Robert Andrews Millikan	1868–1953	(U.S.)	Work on elementary electric charge and the photoelectric effect
1924	Karl Manne Siegbahn*	1886–	(Swedish)	Discoveries in the area of X-ray spectra
1925	James Franck	1882–	(German)	Laws governing collision between electron and atom
	Gustav Hertz	1887–	(German)	
1926	Jean Perrin*	1870–1942	(French)	Discovery of the equilibrium of sedimentation
1927	Arthur H. Compton*	1892–	(U.S.)	Discovery of the dispersion of X-rays
	Charles T. R. Wilson	1869–	(English)	Method of rendering discernible the courses of electrically charged particles by water condensation
1928	Sir Owen Willans Richardson	1879–	(English)	Discovery of the law known by his name (the dependency of the emission of electrons on temperature)
1929	Louis-Victor de Broglie	1892–	(French)	Wave nature of electrons
1930	Sir Chandrasekhara Raman	1888–	(Indian)	Works on the diffusion of light and discovery of the effect known by his name
1931	(No award)			
1932	Werner Heisenberg	1901–	(German)	Creation of quantum mechanics
1933	Paul Adrien Maurice Dirac	1902–	(English)	Discovery of new fertile forms of the atomic theory
	Erwin Schrödinger	1887–	(Austrian)	
1934	(No award)			
1935	James Chadwick*	1891–	(English)	Discovery of the neutron
1936	Victor Hess	1883–	(Austrian)	Discovery of cosmic radiation
	Carl David Anderson	1905–	(U.S.)	Discovery of the positron
1937	Clinton Joseph Davisson	1881–	(U.S.)	Discovery of diffraction of electrons by crystals
	George P. Thomson	1892–	(English)	
1938	Enrico Fermi	1901–	(Italian)	Artificial radioactive substances
1939	E. O. Lawrence	1901–	(U.S.)	Invention of cyclotron
1940–42	(No award)			
1943	Otto Stern	1888–	(U.S.)	Detection of magnetic movements of protons
1944	Isidor Isaac Rabi	1898–	(U.S.)	Studies of atom's nucleus
1945	Wolfgang Pauli	1900–	(Austrian)	Work on atomic fissions
1946	Percy Williams Bridgman*	1882–	(U.S.)	High-pressure physics
1947	Sir Edward Appleton*	1892–	(English)	Discovery of Appleton layer
1948	Patrick Maynard Stuart Blackett	1897–	(English)	Discoveries in cosmic radiation
1949	Hideki Yukawa	1907–	(Japanese)	Theoretical work on meson
1950	Cecil Frank Powell	1903–	(English)	Photographic method of studying atomic nuclei; discoveries about mesons
1951	Sir John Douglas Cockcroft	1897–	(English)	Transmutation of atomic nuclei by artificially accelerated atomic particles
	Ernest Thomas Sinton Walton	1903–	(Irish)	
1952	Felix Bloch	1905–	(U.S.)	Measure of magnetic fields in atomic nuclei
	Edward Mills Purcell	1912–	(U.S.)	
1953	Frits Zernike	1888–	(Dutch)	Introduction of phase contrast microscopy

Chemistry

1901	Jacobus Henricus van't Hoff	1852–1911	(Dutch)	Laws of chemical dynamics and osmotic pressure
1902	Emil Fischer	1852–1919	(German)	Synthetic work with the sugar and purine groups
1903	Svante Arrhenius	1859–1927	(Swedish)	Theory of electrolytic dissociation
1904	Sir William Ramsay	1852–1916	(English)	Discovery of different gaseous basic materials in the atmosphere and their places in periodic system

Chemistry—Continued

1905	Adolf von Baeyer	1835–1917	(German)	Organic dyes and aromatic hydrocarbon compounds
1906	Henri Moissan	1852–1907	(French)	Isolation of the element fluorine and introduction of Moissan furnace
1907	Eduard Buchner	1860–1917	(German)	Discovery of noncellular fermentation
1908	Sir Ernest Rutherford*	1871–1937	(English)	Decay of elements and chemistry of radioactive substances
1909	Wilhelm Ostwald	1853–1932	(German)	Work on catalysis, chemical equilibrium and reaction velocities
1910	Otto Wallach	1847–1931	(German)	Pioneer work in alicyclic combinations
1911	Marie Curie	1867–1934	(French)	Discovery of basic materials of radium and polonium; isolation of radium in metallic condition
1912	Victor Grignard	1871–1935	(French)	Discovery of the so-called Grignard reaction
	Paul Sabatier	1854–1941	(French)	Method of hydrating organic combinations in presence of finely divided metals
1913	Alfred Werner	1866–1919	(Swiss)	Combined conditions of atoms in molecule; research in inorganic chemistry
1914	Theodore William Richards*	1868–1928	(U.S.)	Exact determination of the atomic weights of numerous chemical substances
1915	Richard Willstätter	1872–1942	(German)	Investigation of dyestuffs in the vegetable kingdom, especially of chlorophyll
1916	(No award)			
1917	(No award)			
1918	Fritz Haber	1868–1934	(German)	Invention of a process of procuring ammonia synthetically from its elements
1919	(No award)			
1920	Walter Nernst	1864–1941	(German)	Thermochemical work
1921	Frederick Soddy	1877–	(English)	Chemistry of radioactive substances; occurrence and nature of isotopes
1922	Francis William Aston*	1877–1945	(English)	Discovery of the conduct of isotope mixtures and the law of complete numbers
1923	Fritz Pregl	1869–1930	(Austrian)	Microanalysis of organic substances
1924	(No award)			
1925	Richard Zsigmondy	1865–1929	(German)	Heterogeneous nature of colloidal solutions
1926	Theodor Svedberg	1884–	(Swedish)	Work on disperse systems
1927	Heinrich Wieland	1877–	(German)	For researches on bile acids
1928	Adolf Windaus	1876–	(German)	Constitution of sterins and their connection with the vitamin group
1929	Sir Arthur Harden	1865–1940	(English)	Fermentation of sugars and the enzymes acting in this connection
	Hans von Euler-Chelpin	1873–	(Swedish)	
1930	Hans Fischer	1881–1945	(German)	The chemistry of pyrrole and the synthesis of haemin
1931	Carl Bosch	1874–1940	(German)	Invention and development of chemical high-pressure methods
	Friedrich Bergius	1884–1949	(German)	
1932	Irving Langmuir	1881–	(U.S.)	Discoveries in surface chemistry
1933	(No award)			
1934	Harold Clayton Urey*	1893–	(U.S.)	Discovery of heavy hydrogen
1935	Frédéric Joliot	1900–	(French)	For artificially producing radioactive elements
	Irène Joliot-Curie*	1897–	(French)	
1936	Peter Debye	1884–	(Dutch)	Theoretic and experimental physics
1937	Walter Norman Haworth*	1883–1950	(English)	Research on carbohydrates and vitamin C
	Paul Karrer	1889–	(Swiss)	Vitamin researches; vegetable dyestuffs
1938	Richard Kuhn	1900–	(German)	Carotinoid study and vitamin research (declined the award)[1]
1939	Adolph Butenandt	1903–	(German)	Work on sexual hormones (declined the award)[1]
	Leopold Ruzicka	1887–	(Swiss)	Polymethylenes and the higher terpen compounds
1940–42	(No award)			
1943	Georg von Hevesy	1885–	(Hungarian)	Discoverer of hafnium
1944	Otto Hahn	1879–	(German)	Atomic fission
1945	Artturi Virtanen	1895–	(Finnish)	Conservation of fodder
1946	James B. Sumner	1887–	(U.S.)	Crystallizing of enzymes
	John H. Northrop	1891–	(U.S.)	Purified production of enzymes and virus products
	Wendell M. Stanley	1904–	(U.S.)	
1947	Sir Robert Robinson*	1886–	(English)	Alkaloids and other plant products
1948	Arne Tiselius	1902–	(Swedish)	Colloid analysis
1949	William Francis Giauque	1895–	(U.S.)	Properties of matter under conditions approaching absolute zero
1950	Otto Diels	1876–1954	(German)	Development of dien-synthesis
	Kurt Alder	1902–	(German)	
1951	Edwin M. McMillan	1907–	(U.S.)	Discoveries of transuranium elements
	Glenn T. Seaborg*	1912–	(U.S.)	
1952	Archer J. P. Martin	1910–	(English)	Separation of chemical compounds
	Richard L. M. Synge	1914–	(English)	
1953	Hermann Staudinger	1881–	(German)	Study of macromolecule

Physiology or Medicine

1901	Emil von Behring	1854–1917	(German)	Serum therapeutics
1902	Sir Ronald Ross	1857–1932	(English)	Malaria from mosquito to human
1903	Niels Ryberg Finsen	1860–1904	(Danish)	Light treatment in disease, especially skin diseases
1904	Ivan Petrovich Pavlov	1849–1936	(Russian)	Physiology of digestion
1905	Robert Koch	1843–1910	(German)	Founded scientific bacteriology and bacterial cultures
1906	Camillo Golgi	1843–1926	(Italian)	Structure of nervous system
	Santiago Ramón y Cajal	1852–1934	(Spanish)	
1907	Charles Louis Alphonse Laveran	1845–1922	(French)	Protozoans as irritants of disease (trypanosomes, etc.)
1908	Paul Ehrlich	1854–1915	(German)	Immunity
	Ilya Mechnikov	1845–1916	(Russian)	
1909	Emil Theodor Kocher	1841–1917	(Swiss)	Physiology, pathology and surgery of thyroid gland
1910	Albrecht Kossel	1853–1927	(German)	Cellular chemistry, especially albumin and nuclein substances
1911	Allvar Gullstrand	1862–1930	(Swedish)	Dioptrics of the eye
1912	Alexis Carrel*	1873–1944	(French)	Vascular seams and organ and blood vessel transplantation
1913	Charles Richet	1850–1935	(French)	Anaphylactic test
1914	Robert Bárány	1876–1936	(Austrian)	Physiology and pathology of human vestibular apparatus
1915	(No award)			
1916	(No award)			
1917	(No award)			
1918	(No award)			
1919	Jules Bordet	1870–	(Belgian)	Discoveries in the realm of immunity
1920	August Krogh	1874–1949	(Danish)	Capillary-motoric mechanism of regulation
1921	(No award)			
1922	Archibald Vivian Hill*	1886–	(English)	Discovery relating to the heat production of muscles
	Otto Meyerhof	1884–1951	(German)	Discovery of correlation between consumption of oxygen and production of lactic acid in muscles
1923	Sir Frederick Grant Banting	1891–1941	(Canadian)	Insulin
	J. J. R. Macleod*	1876–1935	(Scotch)	
1924	Willem Einthoven	1860–1927	(Dutch)	Mechanism of the electrocardiograph
1925	(No award)			
1926	Johannes Andreas Grib Fibiger	1867–1928	(Danish)	Discovery of Spiroptera carcinoma
1927	Julius Wagner-Jauregg	1857–1940	(Austrian)	Therapeutic importance of malaria vaccination in dementia paralytica
1928	Charles Nicolle	1866–1936	(French)	Work on typhus exanthematicus
1929	Christiaan Eijkman	1858–1930	(Dutch)	Antineuritic vitamins
	Sir Frederick Hopkins*	1861–1947	(English)	Growth-promoting vitamins
1930	Karl Landsteiner	1868–1943	(U.S.)	Human blood groups
1931	Otto Heinrich Warburg	1883–	(German)	Respiratory ferment
1932	Edgar Douglas Adrian*	1889–	(English)	Function of the neurone
	Sir Charles Scott Sherrington*	1861–1952	(English)	
1933	Thomas Hunt Morgan*	1866–1945	(U.S.)	Hereditary functions of chromosomes
1934	George Richards Minot	1885–1950	(U.S.)	Liver therapy of anaemia
	William Parry Murphy	1892–	(U.S.)	
	George Hoyt Whipple	1878–	(U.S.)	
1935	Hans Spemann	1869–1941	(German)	Embryonic development
1936	Sir Henry Hallett Dale	1875–	(English)	Chemical transmission of nerve impulses
	Otto Loewi	1873–	(Austrian)	
1937	Albert von Szent-Györgyi von Nagyrapolt	1893–	(Hungarian)	Biological combustion, especially vitamin C and catalysis of fumaric acid
1938	Corneille Heymans	1892–	(Belgian)	Regulation of respiration
1939	Gerhard Domagk	1895–	(German)	Antibacterial effect of prontosil (declined award)[1]
1940–42	(No award)			
1943	Edward Adelbert Doisy	1893–	(U.S.)	Research into and discovery of vitamin K
	Henrik Dam	1895–	(Danish)	
1944	Joseph Erlanger	1874–	(U.S.)	Differentiation of nerves
	Herbert Spencer Gasser	1888–	(U.S.)	
1945	Sir Alexander Fleming*	1882(?)–	(English)	Discovery of penicillin
	Ernst Boris Chain	1906–	(British cit.)	Development of penicillin
	Sir Howard Florey*	1898–	(English)	
1946	Hermann J. Muller*	1890–	(U.S.)	Heredity effects of X-rays
1947	Carl F. Cori	1896–	(U.S.)[2]	Isolation of enzyme initiating conversion of animal starch into sugar
	Gerty T. Cori	1896–	(U.S.)[2]	
	Bernardo A. Houssay	1887–	(Argentine)	Pituitary hormone function
1948	Paul Mueller	1899–	(Swiss)	Properties of DDT
1949	Walter Rudolf Hess	1881–	(Swiss)	Functions of middle brain
	Antonio Egas Moniz	1874–	(Portuguese)	Prefrontal leucotomy
1950	Philip S. Hench	1896–	(U.S.)	Work with cortisone and other adrenal hormones
	Edward C. Kendall*	1886–	(U.S.)	
	Tadeusz Reichstein	1897–	(Swiss)	
1951	Max Theiler	1899–	(South African)	Discoveries concerning yellow fever
1952	Selman A. Waksman	1888–	(U.S.)	Codiscovery of streptomycin
1953	Fritz Albert Lipmann	1899–	(German-U.S.)	Discovery of co-enzyme A
	Hans Adolph Krebs*	1900–	(German-English)	Development of so-called Krebs or citric acid cycle

Literature

1901	René Sully-Prudhomme	1839–1907	(French)	Poet
1902	Theodor Mommsen	1817–1903	(German)	Historian
1903	Björnstjerne Björnson	1832–1910	(Norwegian)	Dramatist, poet, novelist
1904	Frédéric Mistral	1830–1914	(French)	Poet
	José Echegaray	1832–1916	(Spanish)	Dramatist
1905	Henryk Sienkiewicz	1846–1916	(Polish)	Novelist
1906	Giosuè Carducci	1835–1907	(Italian)	Poet
1907	Rudyard Kipling	1865–1936	(English)	Novelist and poet
1908	Rudolf Eucken	1846–1926	(German)	Philosopher
1909	Selma Lagerlof	1858–1940	(Swedish)	Novelist
1910	Paul von Heyse	1830–1914	(German)	Novelist, dramatist, poet
1911	Maurice Maeterlinck	1862–1949	(Belgian)	Dramatist
1912	Gerhart Hauptmann	1862–1946	(German)	Dramatist
1913	Sir Rabindranath Tagore	1861–1941	(Indian)	Poet
1914	(No award)			

[1]By Hitler's decree of Jan. 31, 1937, all Germans were forbidden to accept Nobel prizes.

[2]Born in Prague, in U.S. since 192 , U.S citizens.

Literature—Continued

1915	Romain Rolland	1866–1944	(French)	Novelist
1916	Verner von Heidenstam	1859–1940	(Swedish)	Poet
1917	Karl Gjellerup	1857–1919	(Danish)	Novelist
	Henrik Pontoppidan	1857–1943	(Danish)	Novelist
1918	(No award)			
1919	Carl Spitteler	1845–1924	(Swiss)	Poet and novelist
1920	Knut Hamsun	1859–1952	(Norwegian)	Novelist
1921	Anatole France	1844–1924	(French)	Novelist
1922	J. Benavente y Martínez	1866–1936(?)	(Spanish)	Dramatist
1923	William Butler Yeats	1865–1939	(Irish)	Poet
1924	Wladyslaw S. Reymont	1868–1925	(Polish)	Novelist
1925	George Bernard Shaw*	1856–1950	(Irish)	Dramatist
1926	Grazia Deledda	1875–1936	(Italian)	Novelist
1927	Henri Bergson	1859–1941	(French)	Philosopher

NOBILE, UMBERTO (1885–   ), Italian explorer, was born at Lauro on Jan. 21, 1885. He was educated at the Naples Polytechnic, and became an engineer. Later he obtained a post with the ministry of public works in Rome. He was given a post in the war ministry and was entrusted with the construction of the airship "Roma," with the assistance of Uselli. His airship, the "Norge," was used for the flight with Roald Amundsen to the pole in May 1926, when a landing was made at Teller, Alaska. Nobile was promoted to the rank of general, was made a marquis and appointed a professor at the Naples Technical college. A controversy subsequently arose both with Lincoln Ellsworth and Amundsen with reference to the credit for leadership of the expedition. In May 1928 Nobile set out on a second expedition to the north pole in the airship "Italia," but shortly after passing over the pole on May 24, 1928, the airship crashed on the ice (May 25). The gondola and main cabin were smashed, and the ten men in them thrown out on the ice. Seven of the party were carried away with the balloon and were never traced. On May 30 three of the party, Finn Malmgren, Adalbert Mariano and Filippi Zappi, set out on foot, hoping to reach Cape North. After their departure on June 9, the remainder of the expedition managed to establish wireless communications with rescue parties, and on June 23 Nobile was rescued by an aeroplane belonging to the Swedish expedition. The six men remaining with the party were rescued. Mariano and Zappi were located on July 12 by the Russian airman Tchuknovsky. Malmgren (*q.v.*) died near Brock Island. Nobile was found responsible for the loss of the "Italia" by an Italian commission of inquiry in 1929 and resigned his rank in consequence, but was reinstated in 1945. From 1939 to 1942 he taught in the U.S., returning to Italy in 1943.

BIBLIOGRAPHY.—E. Dithmer, *The Truth about Nobile* (London, 1933); D. Giudici, *The Tragedy of the Italia* (1929).

NOBLE, SIR ANDREW, 1ST BART., cr. 1902 (1832–1915), British physicist and artillerist, was born at Greenock on Sept. 15, 1832, and was educated at Edinburgh academy and at the Royal Military academy, Woolwich. In 1849 he entered the royal artillery, attaining the rank of captain in 1855, and in 1857 became secretary to the Royal Artillery institution. About this time the question of the supersession of the old smooth-bores by rifled guns was coming to the fore, and on the appointment of the select committee on rifled cannon in 1858 to report on the matter, he was chosen its secretary. He devised an ingenious method for comparing the probable accuracy of the shooting attainable with each type of gun. In 1859 he was appointed assistant-inspector of artillery, and in the following year he became a member of the ordnance select committee and of the committee on explosives, serving on the latter until its dissolution 20 years later. About the same time he was prevailed upon by Sir William, afterward Lord, Armstrong to leave the public service and take up a post at Elswick. There he became chairman of the company. About 1862 he invented his chronoscope for the measurement of exceedingly small intervals of time and began to apply it in ballistic experiments for ascertaining the velocity with which the shot moves along the barrel of a gun with different powders and different charges. Then he joined Sir Frederick Abel in a classical research on "fired gunpowder," the experimental work being largely carried on at Elswick. The conclusions they reached had a great effect on the progress of gunnery, for they showed increased pressures in the gun. Noble advocated nitro or "smokeless" powders, and the Elswick works provided facilities, which were not offered by the government, for the necessary experimental work of the committee on cordite. Nobel received many honours. His scientific papers were collected as *Artillery and Explosives* (1906). He died in Argyllshire on Oct. 22, 1915.

NOCERA INFERIORE, formerly NOCERA DEI PAGANI (anc. city *Nuceria Alfaterna*), town and episcopal see, Campania, Italy, province of Salerno, at the foot of Monte Albino, 23 mi. E.S.E. of Naples by rail, 135 ft. above sea level. Pop. (1951) 35,688 (commune). In the old castle Helena, widow of Manfred, died after the battle of Benevento. Two miles east near the village of Nocera Superiore is the circular domed church of Sta. Maria Maggiore, dating from the 4th century.

The city early became an episcopal see, and in the 12th century it sided with Innocent II against Roger of Sicily, suffering severely for its choice. A colony of Saracens introduced by Frede-

rick II probably gave rise to the epithet ("of the pagans"), as well as to the town of Pagani, about 1 mi. west.

NOCTURN or **NOCTURNE,** in music a term meaning "night piece," a composition, usually for the pianoforte, of a dreamy, tender, romantic and predominantly sad or wistful character. The name is now inseparably connected with Frederic Chopin's incomparable compositions so described, though it was actually first employed by the once famous Irish composer and pianist, John Field (*q.v.*), for some charming pieces of his own in precisely the same style. "Notturno" (Italian) was used originally as a term for a type of serenade. Wolfgang Mozart wrote a delightful work under this name for strings and two horns, and an exquisite number in Jakob Mendelssohn's "Midsummer Night's Dream" music is also so described.

In the form "nocturn" the word is used as a form of *Nocturnae* or watches of the night. On Sundays there are three nocturns; the first contains 12 psalms and the two others contain three psalms each. A lesson is read at the end of each nocturn and each lesson is divided into three portions.

NODDY, the name applied to a sea bird, *Anous stolidus,* one of the terns (*q.v.*), from its showing so little fear of man as to be accounted stupid. It is heavier in flight than most terns, with shorter wings and less forked tail. The plumage is of a uniform sooty hue, except the light gray crown of the head. The noddy is very generally distributed throughout tropical and subtropical oceans. It breeds in astounding numbers, on low cays and coral islets, making a nest composed of seaweed or small twigs. Other birds of the same genus are the darker Pacific noddy (*A. s. sidgwayi*), the still darker Galapagos noddy (*A. s. galapagoensis*) and the white-headed noddy (*A. leucocapillus*). There is also the white noddy (*Gygis alba*).

See J. B. Watson in *Papers from the Tortugas Laboratory*, No. 8.

NODE [Lat. *nodus,* a loop], in astronomy, one of two opposite points at which a heavenly body passes through the principal co-ordinate plane to which its motion is referred. In the case of the heavenly bodies this plane is commonly that of the ecliptic, but, in special cases, the plane through the origin parallel to the earth's equator or the plane of a planet's orbit is used. The ascending node is that at which the body moves from the south or negative toward the north or positive side of the plane. The moon's nodes are the points in which its path intercepts the plane of the ecliptic. In the geometry of curves, a node is the name given to the loop formed by a continuous curve crossing itself, the point of crossing is termed a "double point," and at it there are two noncoincident tangents to the curve; the remaining species of double points, termed "acnode," "spinode" or "cusp," admits of two coincident tangents (*see* CURVE).

NODIER, CHARLES (1780–1844), French author, was born at Besançon. His father, on the outbreak of the French Revolution, was appointed mayor of Besançon and Charles is said to have been a member of the Jacobin club when he could not have been more than 12 years old. He was sent to Strasbourg, where he lived in the house of Eulogius Schneider, the notorious Jacobin governor of Alsace, but a good Greek scholar. He became librarian in his native town, but his exertions in the cause of suspected persons brought him under suspicion. For a skit on Napoleon, in 1803, he was imprisoned for some months. He then lived a very unsettled life at Besançon, Dôle, where he married, and in other places in the Jura. During these wanderings he wrote *Le Peintre de Salzbourg, journal des émotions d'un coeur souffrant, suivi des Méditations du cloître* (1803). He continued to lead an unsettled life until in 1824 he was appointed to the librarianship of the Bibliothèque de l'Arsenal. He was elected a member of the academy in 1833, and died on Jan. 27, 1844. During his 20 years at the arsenal he was able to supply a centre and rallying place to a knot of young literary men of greater individual talent than himself—the so-called Romanticists of 1830—and to colour their tastes and work very decidedly with his own predilections. Victor Hugo, Alfred de Musset and Charles-Augustin Sainte-Beuve all acknowledged their obligations to him. He was a passionate admirer of Johann Wolfgang von Goethe and of William Shakespeare. The best examples of his work are to be found in the volume entitled *Mélanges tirés d'une petite bibliothèque.*

His *Description raisonnée d'une jolie collection de livres* (1844), which is a catalogue of the books in his library, contains a life by Francis Wey and a complete bibliography of his numerous works. *See* also C. A. Sainte-Beuve, *Portraits littéraires,* vol. ii; G. Brandes, *Main Currents in 19th Century Literature* (1871); Prosper Mérimée, *Portraits historiques et littéraires* (1874); A. NŌ DRAMA. In Japan in the beginning of the 15th century, the *saru-gaku* (lit. "monkey music," consisting of juggling feats and comic remarks with actions to suit) of Yamato province was revolutionized by Kan-nami Kiyotsugu and his son Se-ami Motokiyo, and what is now known as *nō-gaku,* or *nō* music or drama resulted. Not only did these two geniuses, under the encouraging patronage of the Shogun Yoshimasa, build on what was best in their own *saru-gaku,* but they drew freely from *den-gaku* (lit. "rice-field music") which had much in common with the *saru-gaku.* What was graceful in them was ennobled to profundity in the *nō,* while their comical elements developed into *kyogen* (comic performance) usually given in conjunction with the *nō.*

The *nō-gaku* constituted the principal form of entertainment among aristocrats and the warrior class in the feudal Japan. It was sometimes given in the presence of the emperors, and there prevailed a custom for a time to invite the common people to the performances given in commemoration of some happy events by the Tokugawa shoguns, who used the *nō* on all ceremonial occasions.

Staging.—The *nō* is performed on a wooden stage built above the ground, the regular size of which now is 18 ft. square, open on three sides, with a narrow extension on one side for the singers, and another on the back of the stage for the musicians and attendants. To that rear extension is attached aslant a passage called *hashigakari* (a bridge). The players appear from under the curtain at the one end of which the passage slightly slopes down. The stage, too, is very slightly tilted to the front. For acoustic purposes, big ceramic jars are placed, generally seven under the stage and two or more under the passage according to its length. Three pine saplings are planted at intervals along the front of the bridge. The wooden wall called *kagami-ita* (mirror board) on the back of the rear extension, forming a background to the stage, is always decorated with a painting of a pine tree, and the narrow panel adjoining it on the side with that of bamboo. These paintings, together with the saplings, may be taken to indicate that originally the *nō* was performed in the woods.

Character of the Nō Pieces.—The *nō* pieces, which number more than 250, are classified into five groups for convenience: (1) *waki-nō* (pieces in which *waki,* the secondary character, assumes preponderance in the play) generally dealing with Shinto or Buddhist deities; (2) *shura-mono,* which commonly deals with ghosts of warriors; (3) *kazura-mono,* with noble ladies acting the main parts; (4) *genzai-mono,* or present-day piece, dealing with love, insanity and other manifestations of human nature; (5) pieces dealing with demons or goblins as subjects, or those of congratulatory nature with gay and joyous elements. For each program of *nō* performance, which generally lasts a whole day, one from each of the above-mentioned five classes is given in the order mentioned, with a *kyogen* between each and generally a dance in an ordinary dress in addition. The whole program is preceded by a piece called "Okina," which is held in special reverence, the person acting its chief character, Okina, symbolizing the radiant sun goddess.

Construction of Nō Pieces.—The construction of the *nō* piece, though by no means uniform, is generally as follows. A *waki* (the secondary role), generally a monk or a minister of state, first appears and tells who he is. Then he walks a while, singing, suggesting that he is travelling. Coming to a standstill, he announces his arrival at a certain famous spot and takes his

7. "Yamamba" used by the heroine in *Yamamba*. Marquis Maeda's collection

place by the post at the front right-hand corner facing the stage. Then the *maye jite* (the principal character in the first appearance) comes in the form of a farmer, fisherman or priest, etc., describing the scenery of the place, or speaking to the *waki* resting at the post. The *waki* questions him, and the *maye jite* gives a historical account of the place and of heroes connected with it, or relates the origin of the temple or shrine as the case may require, thus furnishing the audience with a necessary background to the play. The *maye jite* then retires in a hurry. He was in reality no other than a Shinto or Buddhist deity, or a ghost of a warrior, in disguise. While the *waki* is startled by the sudden disappearance, there come to the stage common farmers or wood choppers and give in plain language, spoken more or less in the ordinary way, all detailed information concerning the place, generally reiterating what was already given in intonation, and retire. This allows a necessary time for the principal character to change for reappearance. While waiting, the *waki* sings, indicating a lapse of time. When it comes to an end, the *nochi jite* (the principal character in the latter appearance) in proper form and attire as a Shinto or Buddhist deity, or a spirit of a hero, comes to the stage and dances as if in a night stroll, revealing some spiritual attributes. In words and in action he recounts his bravery, his death struggle or his suffering in the underworld, asking for the prayer of the *waki* for the peaceful repose of his soul. The *shite* tells his story as he performs, or he merely dances without any intonation. Generally there is a chorus who intonate either alone or with the performers.

Music and Accessories.—Generally several persons sitting on the side extension sing either in chorus, by themselves or together with the performer. The musicians on the rear extension consist ordinarily of a player each on the transverse flute, the *tsuzumi* (small drum struck with tips of fingers over the shoulder), the *ōkawa* (a slightly larger drum struck on the knee also with tips of fingers) and the drum beaten with two sticks.

The accessories used on the stage in connection with the play are very simple. A fan is much in evidence in the dance and masks are worn by the principal character (*shite*) and the assistant (*shite-zure*).

NOEL, RODEN BERKELEY WRIOTHESLEY (1834–1894), English poet, son of Noel, Lord Barham, afterward earl of Gainsborough, was born on Aug. 27, 1834. He was educated at Trinity college, Cambridge, and spent two years in the east. His works include *A Little Child's Monument* (1881); *Behind the Veil, and Other Poems* (1863); *Beatrice, and Other Poems* (1868); *The Red Flag* (1872); *Livingstone in Africa* (1874); *Songs of the Heights and Deeps* (1885); *A Modern Faust, and Other Poems* (1888); *Poor People's Christmas* (1890); and *My Sea, and Other Poems* (1896). Roden Noel's versification was unequal and sometimes harsh, but he had a genuine feeling for nature, and the work is permeated by philosophic thought. He died at Mainz, on May 26, 1894.

His *Collected Poems* were edited (1902) by his sister, Victoria Buxton, with a notice by J. Addington Symonds.

NOGALES, a city on the southern boundary of Arizona, U.S., adjoining Nogales, Mexico; a port of entry and the county seat of Santa Cruz county. It is the southern terminus of federal highway 89, and is served by the Southern Pacific railroad, which there meets the Sud Pacifico de Mexico railroad. The population was 6,153 in 1950 and was 5,135 in 1940 by the federal census. Nogales has an altitude of 3,869 ft., and is surrounded by the Patagonia mountains. Stock raising, mining, agriculture and tourist services are the leading occupations of the region.

The old Spanish mission of Tumacacori is 18 mi. N. In 1880 Nogales was a trading post. In 1893 it was incorporated as a town and in 1919 as a city.

NOGARET, GUILLAUME DE (d. 1313), councillor and keeper of the seal to Philip IV of France, was born between 1260 and 1270, the son of a citizen of Toulouse. His family, which took its name from a small property near Saint-Félix de Caramon, was later said by Nogaret's enemies to have adhered to the Albigensian heresy. Guillaume became professor of jurisprudence at the University of Montpellier (1291); entered the king's service as *juge-mage* in the *sénéchaussée* of Beaucaire (*c.* 1294); was made a member of the *curia regis* in Paris (1296) and, as king's commissary, was entrusted with missions to Normandy, Bigorre and Champagne; and went to Rome with an embassy (1300). In 1299 he took the title of knight. He is the best known of the *légistes* and a good representative of those faithful and even fanatical servants of the royal power, but his influence on Philip IV's policy has been greatly exaggerated. His name is mainly connected with Philip's clash with Boniface VIII (*q.v.*). On March 12, 1303, after the publication of the bull *Unam sanctam* Nogaret addressed an assembly in Paris, denouncing the pope as illegitimate and heretical and demanding a general council to try him. He had already (March 7) been commissioned by the king to go to Italy to notify Boniface of the summons and to take him into custody. From the castle of Staggia, between Florence and Sienna, Nogaret prepared the arrest of the pope, who had refused the notification and was preparing the bull *Super Petri solio*, which excommunicated the king. He got in touch with some of Boniface's enemies, several cardinals and the population of Anagni. At dawn on Sept. 7, 1303, he entered Anagni, with a small force under Rinaldo de Supino, captain of Ferentino, the gates having been left open by his supporters. But the Colonnas, under Sciarra Colonna, had been informed of this move and entered the town at the same time in pursuance of their vendetta against Boniface. Nogaret's carefully prepared legal apparatus was broken down by their looting and violence, which brought on the rising of the townsmen on Sept. 9. Nogaret, who had in fact saved Boniface's life, was wounded and had to flee to Ferentino. He returned to France early in 1304 and was rewarded by the king with a pension of 500 *livres*. Nogaret's part in this affair must be understood as the action of an almost fanatical Christian ready to sacrifice anything to free the church from a pope whom he thought unworthy. However, much of the odium of the outrage fell upon him; and on June 7, 1304, the new pope Benedict XI issued a bull *Flagitiosum scelus* against Nogaret and 15 others, though he had already cleared Philip of any responsibility. Nogaret, much embittered, devoted himself to getting his innocence recognized. Eventually the French pope Clement V, whose election he had promoted and whom he threatened with proceedings against the memory of Boniface, absolved him on April 27, 1311. Meanwhile, he had kept Philip's favour: as the keeper of the seal (Sept. 22, 1307, to his death, April 1313), he reorganized the chancellor's office; and in 1305 he was put in charge of the inquiry on the denunciations of the Templars by Esquieu de Floyran. On Oct. 13, 1307, he organized the general arrest of the Templars and directed the seizure of the Paris Temple; and he played a large part in the subsequent proceedings, especially those against the high dignitaries of the order. There is, however, no reason to see Nogaret's hand in all state trials of his time.

NOGENT-SUR-MARNE, a suburb 6.7 mi. E. of Notre Dame de Paris, in the department of Seine, on a hill on the right bank of the Marne. Pop. (1946) 21,547. The Eastern railway crosses the Marne valley there by a viaduct 875 yd. in length. Nogent has a Gothic church with a tower of the Romanesque period, in front of which there is a monument to Antoine Watteau, who died there in 1721. Chemical products are manufactured. The fine situation of the town gained it the name of Beauté, and Charles V built a château there (demolished in the 18th century) which was presented by Charles VII to Agnes Sorel with the title of Dame de Beauté. An island in the Marne to the south of the town is still known as the Ile de Beauté. The increase of population there in recent years is very notable.

NOGUCHI, HIDEYO (1876–1928), Japanese bacteriologist, was born in Inawashiro, Yama, Fukushima, Japan, Nov. 24, 1876. He received the degree of M.D. in 1897 from the Tokyo Medical college and subsequently did postgraduate work in the United States and Europe, becoming connected with the Rockefeller Institute for Medical Research in New York in 1904. He was the first to obtain pure cultures of the spirochaete of syphilis and to establish the syphilitic nature of general paralysis and *tabes dorsalis* by demonstrating the organism in the cells of the central nervous system of persons dying of these diseases. He did considerable work on the analysis of the Wassermann reaction for the diagnosis of syphilis and devised a skin test for syphilis and a method for the detection of syphilitic and other pathological conditions in the spinal fluid. One of the first to recognize the germicidal properties of certain compounds of unsaturated fatty acids for acid-fast micro-organisms, *e.g.*, the tubercle bacillus, he discovered the parasite of yellow fever in 1918 and prepared a prophylactic vaccine and a curative serum for combating this disease. He also isolated the parasite of Oroya fever and *Verruga peruviana*. During his investigations he contracted yellow fever and died in British West Africa on May 21, 1928.

His published works include *Snake Venoms* (1909), *Serum Diagnosis of Syphilis and Luetin Reaction* (1910) and *Laboratory Diagnosis of Syphilis* (1923).

NOISE AND ITS CONTROL. No rigid definition of noise is possible. By analogy with "dirt," it has been called "sound out of place," and it is usually a medley of individual sounds. For measuring noise the most widely used instrument is the sound level meter, which by 1944 had become an American standard built to definite specifications. It measures the intensity level of the noise in decibels (db.). By means of a switching arrangement it can be made also to measure approximately the loudness level of the noise in phons. The phon scale is such that when two noises have the same loudness level they will sound equally loud to a typical person having normal hearing. A technique for measuring the phon loudness level has been adopted as an International standard. It is as follows: The intensity level of a pure tone having a frequency of 1,000 cycles per second expressed in decibels is taken as the reference standard. An instrument is arranged so that the intensity level being presented to an ear can be changed by turning a dial which is calibrated to read directly the level in decibels. When the dial is turned to such a position that the reference tone sounds equally loud to the noise whose phon loudness is desired, then the reading of the dial in db. gives the phon loudness level. The International standard adopted as the zero level for the reference tone is the intensity level in a free progressive wave in which the sound power of 10^{-16} watts (w.) is flowing through each square centimetre of the wave front. This same power has been adopted as a reference power for expressing the intensity level of any sound regardless of its character. This power corresponds to a root-mean-square (r.m.s.) pressure amplitude in the wave of 0.0002 dynes per square centimetre. England and some countries of Europe have used different kinds of noise meters which were designed to measure the phon loudness level more accurately than does the American standard sound level meter. These meters have sometimes been referred to as peak meters but none has yet been developed to the point where it has been adopted as a standard for measuring noise.

For a complete description of noise one must know its sound spectrum—that is, the sound power being carried by the various bands of frequencies in the audible range. Instruments known as sound analyzers are now available for making such measurements. From the data obtained, loudness level can be calculated. Also from such a measured sound spectrum one can find out how much other desired sounds will be masked. For example, a cheering street crowd welcoming home some noted hero may cause a masking equivalent to 70 db. deafness, which means that under such circumstances one can make a neighbour hear speech only by shouting close to his ear. The loudness level of such a noise is approximately 95 phons.

In a survey in New York city the average intensity level of street noise varied from 50 to 85 db. At any one place it varied through a range of about 20 db. The highest level encountered in the streets was 107 db., which was caused by a riveter 35 ft. away from the measuring instrument. In World War II extreme noises were encountered in aeroplanes and tanks. The pilots frequently had to operate in noise levels as high as 130 db.

The following table from the report of the Noise Abatement commission of New York city, *City Noise* (1930), gives typical intensity levels for street noises encountered. Since these values have been taken, the reference point of the meters has been changed so that 6 db. must be added to make them agree with the meters in use in 1946.

NOISE LEVELS OUT OF DOORS DUE TO VARIOUS NOISE SOURCES

BY DR. C. STEINBERG, BELL TELEPHONE LABORATORIES

In a survey in the residential section of New York city it was found that noise inside the houses varied from 28 to 52 db. In business offices, factories, department stores, etc., it varied from 40 to 80 db. Approximately 40% of the street noise could be traced to the automobile trucks used for commercial deliveries, 25% to the elevated railway and 20% to the surface cars. The remaining 15% was supplied by private automobiles, taxicabs, automobile horns, horse-drawn vehicles, riveting and excavating machines, alarm signals of the fire and police departments and other occasional noise-producers. At no place on city streets do human speech and human feet make measurable contributions to the noise. At windows street noise decreases with height, but much less so than would be expected from the physical law of attenuation of sounds in the open air, the discrepancy being caused by reflection of the noise between the buildings on the two sides of the street.

It is incorrect to generalize that noise is always harmful to man. Under some circumstances noise may produce greater activity and apparently greater efficiency in performing certain tasks. Practically in every circumstance a greater amount of bodily energy is used up when working in a noise. During World War II it was shown that men in tanks or aeroplanes could operate complicated controls just as efficiently in extreme noise conditions as in the quiet. The main effect upon their operation was that of deafening, which made it very difficult to communicate. Most individuals accustom themselves to living or working in noisy surroundings and only nervous individuals who fail to make this adjustment suffer harmful effects. However, there is no doubt that noisy surroundings where one is expecting quiet are very irritating and consequently have an effect upon the nervous system. During World War II additional evidence was accumulated which indicated that persons immersed continually in very loud noises lose their acuity for hearing although moderate intensity levels seem

to have little effect. Also it was found that the ear could tolerate very much higher levels for a short time without serious injury than it was thought possible before. For example, the intensity level of pure tones as high as 140 db. was impressed upon the human ear without permanent injury although there was a temporary deafness caused for hours or days, depending upon the individual.

Much noise could be prevented by denying use of the streets to vehicles improperly cared for; also by preventing loose, rattling parts on surface cars and by removing loose or wide crossings in the rails of street railways and by restricting the blowing of horns. It is possible that the average street noise of a city could be reduced considerably by adequate enforcement of such regulations. The construction of noise-proof rooms or noise-proof houses is possible on well-known principles of architectural acoustics but is too expensive for general use.

Law.—In law noise may be defined as an excessive, offensive, persistent or startling sound. By the common law of England freedom from noise is essential to the full enjoyment of a dwelling house, and acts which affect that enjoyment may be actionable as nuisances. But it has been laid down that a nuisance by noise, supposing malice to be out of the question, is emphatically a question of degree (*Gaunt* v. *Finney*, 1872, 8 Ch. Ap. 8). The noise must be exceptional and unreasonable. The ringing of bells, building operations, vibration of machinery, fireworks, bands, a circus, merry-go-rounds, collecting disorderly crowds, dancing, singing, etc., have been held under certain circumstances to constitute nuisances so as to interfere with quiet and comfort, and have been restrained by injunction. Noise occasioned by the frequent repetition of street cries is frequently the subject of local bylaws, which impose penalties for infringement. (E. E. F.; HA. F.)

NOLA, an ancient city and see of Campania, Italy, province of Naples, pleasantly situated in the plain between Mount Vesuvius and Apennines, 16¾ mi. E.N.E. of Naples by rail, 121 ft. above sea level. Pop. (1936) 10,733 (town); 18,436 (commune). There is an ancient Gothic cathedral with its lofty tower. July 26 is devoted to a great festival in honour of St. Paulinus (*q.v.*). The church erected by him in honour of St. Felix in the 4th century is extant in part. Giordano Bruno (*q.v.*) was born at Nola in 1548. The Etruscans were in Nola about 500 B C They helped Neapolis against the Roman invasion (328 B.C.). The Romans made themselves masters of it in 313 B.C. In the Social War it was betrayed into the hands of the Samnites. Sulla in 80 B.C. subjected it with the rest of Samnium. Seven years later it was stormed by Spartacus. Nola became a Roman colony under Augustus, who died there. It was sacked by Genseric in 455, by the Saracens in 806 and 904, captured by Manfred in the 13th century, and damaged by earthquakes in the 15th and 16th.

Nola lay on the Via Popillia from Capua to Nuceria and the south, and a branch road ran from it to Abella and Abellinum. While independent it issued an important series of coins, and in luxury it vied with Capua. Its territory was very fertile. A large number of vases of Greek style were manufactured here of pale yellow clay with shining black glaze, decorated with skilfully drawn red figures. Of the ancient city, numerous ruins, an amphitheatre, still recognizable, a theatre, a temple of Augustus, etc., existed in the 16th century. The neighbourhood was divided into pagi or villages, the names of some of which are preserved to us (Pagus Agrifanus, Capriculanus, Lanitanus). (T. A.)

NÖLDEKE, THEODOR (1836–1930), German Semitic scholar, was born at Harburg on March 2, 1836, and studied at Goettingen, Vienna, Leyden and Berlin. In 1859 his history of the Koran won for him the prize of the French Académie des Inscriptions, and he rewrote it in German with additions (*Geschichte des Korans*, Goettingen, 1860). He taught at Goettingen (1861), Kiel (1868) and Strassburg (1872). In the main his work deals with Semitic languages, and the history and civilization of Islam.

Among his best-known works are: *Das Leben Mohammeds* (1863); *Beiträge zur Kenntnis der Poesie der alten Araber* (1864); *Die alttestamentliche Literatur* (1868); *Untersuchungen zur Kritik des Alten Testaments* (1869); *Zur Grammatik des klassischen Arabisch* (1896); *Fünf Mo'allaqat, übersetzt und erklärt* (1899–1901); *Beiträge zur semitischen Sprachwissenschaft* (1904); *Neue Beiträge zur semitischen Sprachwissenschaft* (1910). In the *Encyclopædia Britannica*, he wrote on Persia, the Koran and other subjects.

NOLLEKENS, JOSEPH (1737–1823) British sculptor, was born on Aug. 11, 1737, in Dean Street, Soho, London, where his father, a native of Antwerp, the "old Nollekens" of Horace Walpole, was a painter of some repute. In his 13th year he entered the studio of the sculptor Peter Scheemakers for drawing and modelling. In 1760 he went to Rome, and his marble bas-relief, "Timoclea before Alexander," brought him a prize of 50 guineas from the Society of Arts in 1762. David Garrick and Laurence Sterne were among the first English visitors who sat to him for busts; another important piece belonging to this early period is the "Mercury and Venus chiding Cupid." On his return to England he became an associate of the Royal Academy (1771), and in 1772 a member. By this time he had become known to George III, whose bust he shortly afterward executed, and thenceforward, until about 1816, he was the most fashionable portrait sculptor of his day. He himself thought highly of his early portrait of Sterne. Others were those of William Pitt, Charles Fox, the prince of Wales (afterward George IV), George Canning, Spencer Perceval, Benjamin West and Lords Castlereagh, Aberdeen, Erskine, Egremont and Liverpool. Among his numerous marble groups and statues are the "Bacchus," "Venus taking off her Sandal," "Hope Leaning on an Urn," and (his own favourite performance) "Venus Anointing Herself." His work is remarkable for delicacy, but deficient in vigour and originality. He died in London on April 23, 1823, leaving a large fortune.

NOLLE PROSEQUI, a term of English law now only used of a stay of proceedings by indictment or by information entered by the attorney general. The *nolle prosequi* is a matter purely for his discretion, and will not be granted unless very good ground be shown for his interference. The object of it generally is to obtain a stay of proceedings against an accomplice in order to procure his evidence. This object is, however, more usually effected by the prosecution offering no evidence and the judge directing an acquittal.

In the United States the attorney general has not always the same discretion with which English law invests him. Although in some states the prosecuting officer may enter a *nolle prosequi* at his discretion, in others the leave of the court must be obtained.

NOMADS, "wanderers," primitive pastoral people who have no settled territory.

Nomads seem to exist in every large territory. Some, like the gypsies (*q.v.*), becoming international. There are Asiatic nomads of all types, the chief being the Mongols whose nomadism became highly specialized. The Basques (*see* EUROPE: *Races and Peoples*) are generally supposed to have been nomads from a remote corner of Asia and the report that shifting colonies of Euskera stock are to this day found in South America supports this view. Northern Asia is the home of numerous wandering tribes, whose very names have only recently been recorded. These tribes have a definite relation with the settled peoples over whose territory they roam, as is the case with the African nomads (*see* below). Indo-China has its nomad peoples, and southwest China is an area over which several nomad stocks wander. The change from nomadism to a settled state of occupation in well-defined areas is rare but not unknown. (*See* ASIA: *Ethnology* and *History: Indo-China.*)

Nomads proper are those who roam over different territories in actual quest of sustenance; as the name implies, they are pastoral people depending on grazing for their animals and edible roots and fruits for themselves. (*See* BUSHMEN.) These nomads have extraordinary powers of adaptability and can support long periods of hunger. The Australian aborigines are sufficiently skilled in woodcraft to trap animals by simply stealing upon them quietly and using the most primitive weapons. The pampas Indians are horseback nomads and wander to and fro over large tracts of territory.

The Bedawin (Bedouins) or Arabs of the desert are among the most familiar of all pastoral nomads, and their nomadism has no known beginning. In times of drought and food shortage such nomads as these and the Hottentots (*q.v.*), are compelled to raid their agricultural settled neighbours. The Kirghiz, an Altai people, are the prominent nomads of Central Asia and their ballads tell of their love of wandering and their passion for their horses, their only tangible possessions.

In recent years much attention has been directed to the nomads of East Africa, as it is believed that from these sprang the original individual peoples of Africa. Some of these nomads are pygmies.

It is probable that at one time they all spoke a distinct language and that many still preserve their own language, while using the language of the tribes among whom they reside. The pygmies of the upper Welle speak the Mbuba language in a manner markedly different from the Mbuba pronunciation, substituting for certain consonants a curious gasp or hiatus almost approximating to a click. The Sanya of northeast Kenya and certain of the Watta are also said to use clicks. The Sandawe (*q.v.*) of Tanganyika Territory, whose skulls

possess distinctly Hottentot characters, retain the typical Bushman clicks and gutturals. Rarely has the tribal name been ascertained, the different nomadic groups being called by the names bestowed on them by neighbouring tribes, but the persistence of some of these appellations is remarkable. Some form of the name Twa is widespread among the Bantu: thus the Bushmen of South Africa are known to their neighbours as Abatoa and Batwa is common throughout the Congo and Uganda. The word is said to mean "Bushdwellers," and is probably unconnected with the Watta of southern Abyssinia which is derived from an old Cushitic root meaning "Wanderers." Aka is a name given to geographically distinct groups of nomads.

In the mountainous forest country of southwest Uganda we find semi-pygmy hunters known as Batwa, and the name reappears on the upper slopes of mount Elgon at an altitude of from 9,000-11,000 ft., where they build earth-roofed huts and live principally on rats, other small mammals and honey.

The Sanya and Choni, hunting tribes living on the banks of the Sabaki and the Tana in Kenya, are also known as Watta to the Galla. They are similar to the Boni of Jubaland, and together with the Midgan and the Sandawe, who also practise circumcision, are the only nomad communities who practise clitoridectomy.

The Doko pygmies were first described in 1842 by Sir W. C. Harris and later by Borelli and Donaldson Smith, and Rigby also in 1842 reported from hearsay evidence the existence of some pygmies called Berikimo about six weeks inland from Mombasa. The latter are probably the pygmies near Lake Baringo, and the former may be the dwarf Dume who are found in the vicinity of Lake Stephanie. Another group of pygmy nomads exists on the slopes of Mt. Kilimanjaro known as Wapare.

Among the Turkana to the west of Lake Rudolf we find the Teuth, who live on roots and grubs and hunt the smaller mammals, and farther south the Ogiek, known to the Masai as Doroba from the Masai word for tsetse fly to which their arrows are likened, wander over a wide area of forest and bush country between Lake Victoria and the eastern lowlands, maintaining a livelihood by hunting and trapping. Among the Nandi the Ogiek are the hunters, but the Kunono fulfil this menial role for the Masai. The Embu speak of pre-Embu inhabitants of Kenya as "Agumba" or "Asi," pygmies, forest dwellers and hunters. The northern Watta of Lake Tana are fishers and skilled watermen, who use papyrus rafts, and on Lake Kwanya the Kenyi, a Bantuized type of nomad, live on the papyrus marshes and are completely aquatic without any interests on the land, being reminiscent culturally of the Batwa on Lake Bangweulu.

Wherever the nomads are found in East Africa they are treated as pariahs and are engaged in trades or occupations which are considered ignoble, such as hunting, fishing, metallurgy, leather tanning and pottery. Among the Kaffa and the Galla they provide the executioners. They are dispossessed rather than conquered, and though among the Kaffa they perform menial services like the collection of fuel, it is just among the Kaffa that their tribal organization is most developed under an independent chief.

They adopt the language of the tribes among whom they live, and in many cases their social organization, costume and even religion. Thus the Sanya have a clan organization based on Galla clans with Galla clan names, and have imitated the Galla initiations and system of age grades. The Somaliland nomads use Mohammedan invocations and celebrate the Mohammedan feasts in addition to their own pagan ritual. But, generally speaking, their religion is a vague ancestor worship. Except when, like the southern Watta, they build temporary villages they are monogamous, and the family wanders from place to place erecting no more than a rude shelter for the night. When anything more permanent is built the little huts are situated close to river banks and are roughly thatched with palm fronds. The northern Watta have portable cane huts which they carry with them in their wanderings. Caves are also used as dwellings and others build hiding places in trees. They possess no domesticated animals except dogs, and few practise agriculture, and that only of the most elementary kind. Their weapons are the bow and arrow with sometimes a spear in addition, and poison is applied to all weapons. The northern Watta, like the Ogiek, use a hunting spear with a detachable head, which carries the owner's distinctive mark enabling him to claim the kill. Game pits are used also.

Usually they are naked, but they may adopt some of the costume of their neighbours. Thus among the Kaffa the nomads have adopted the Kaffa headdress, a conical hat of monkey fur, and wear the large skin aprons worn by their Kaffa overlords. The Fuga, adjacent to the Watta, now clothe themselves with the typical Galla kilt. The Midgan women plait their hair after the Somali fashion, but long, plaited hair is an indigenous characteristic among several groups, particularly in the Bantu zone, as among the Amba Negrillos on the western flanks of Ruwenzori. The Ogiek plait their hair like the Nandi and wear a skullcap made from the stomach of a goat like their Kamasia neighbours.

Everywhere the nomads, despite their low status, are respected and feared, both for their knowledge of poisons and of sorcery in which they are thought to be most proficient. This attitude points to the probability that they were the original owners of the country, their conquerors recognizing their greater spiritual affinity with the soil together with its magical implications; and tends to discredit a Watta legend (of doubtful authenticity) that the Watta were banished from Egypt and on arrival at their present habitats were subjected by the Hamites who were already in possession of the country.

H. Johnston, *The Uganda Protectorate* (1902); Capt C. H. Stigand, *The Land of Zinj* (1913).

NOME, an Alaskan town on the shore of Bering sea, 115 mi. from St. Michael; in 1900 the largest settlement in the territory. Pop. (1950) 1,852; (1939) 1,559. Gulch gold was found near Nome on Anvil creek in Sept. 1898, and diggings on the ocean beach were first worked in July 1899. The rush to Nome in 1900 was one of the most remarkable stampedes in U.S. mining history; the town soon had hotels, banks, stores, several newspapers and weekly mails from the United States; for part of the year there were, it was estimated, 20,000 inhabitants. By 1903 the population had greatly decreased, and in subsequent years the winter population averaged about 3,500, the summer population from 7,000 to 8,000. In 1905 the gold output of the Nome region amounted to about $2,500,000, nearly all from placers, though some quartz mining was done. At mid-century gold was still the principal industry, though greatly decreased in volume; native fur and ivory products were also made. The town is served by several air lines, and a narrow-gauge railway and several roads radiate into the tundra, to various mines and along the coast. Nome was first called Anvil City; the name "Nome" is derived from Cape Nome, first so called on a chart dated 1849, and said to have been a draftsman's mistake for the query "?Name" on the original chart.

NOMENOË or Nominoe (d. 851), duke of Brittany. To pacify Brittany, Louis the Debonair named him count of Vannes in 819 and governor or duke of Brittany in 826. Throughout the reign of Louis, Nomenoë maintained peace in Brittany. But in 841 he resolved to make himself independent of Charles the Bald. In 843 Charles made a vain attempt to subdue Brittany. In 844 Nomenoë invaded Maine, and in 845 the emperor was completely defeated at Ballon near Bain-de-Bretagne. In 846 Charles recognized the independence of Brittany. Having resolved to detach the duchy from the ecclesiastical province of Tours, Nomenoë accused the Frankish bishops of Vannes, Quimper, Dol and Léon of simony at the council of Coëtlouh in 848, replaced them by Bretons, and erected Dol into a metropolitan see. In 849 Nomenoë attacked the Frankish county of Anjou. Charles established a garrison at Rennes. Nomenoë seized Rennes, Nantes and Upper Brittany, and ravaged Maine. In 851 he seized Anjou and invaded Beauce. He died suddenly, leaving as his successor his son Erispoë.

See A. de la Borderie, *Histoire de Bretagne,* vol. ii (1898); R. Merlet, "Guerres d'indépendance de la Bretagne," in the *Revue de Bretagne, de Vendée et d'Anjou* (1891).

NOMINALISM, the name of one of the two main tendencies of mediaeval philosophy, the other being realism (from Lat. *nomen,* name). The controversy between nominalists and realists arose from a passage in Anicius Boëthius' translation of Porphyry's *Introduction to the Categories of Aristotle,* which propounded the problem of genera and species: (1) as to whether they subsist in themselves or only in the mind; (2) whether, if subsistent, they are corporeal or incorporeal; and (3) whether separated from sensible things or placed in them. The realists held that universals alone have substantial reality, existing *ante res;* the nominalists that universals are mere names invented to express the qualities of particular things and existing *post res;* while the conceptualists, mediating between the two extremes, held that universals are concepts which exist in our minds and express real similarities in things themselves. Though a strong realist tendency is evident in the system of Erigena (9th century), the controversy was not definitely started till the 11th century; it lasted till the middle of the 12th, when the first period of scholastic philosophy ends. Under an appearance of much vain subtlety the controversy about universals involved issues of the greatest speculative and practical importance: realism represented a spiritual, nominalism an anti-spiritual, view of the world; while realism was evidently favourable, and nominalism unfavourable, to the teaching of the Church on the dogmas of the Trinity and the Eucharist. Nominalism was a doctrine of sceptics and suspected heretics, such as Berengar of Tours and Roscellinus. Even Abe-

lard's mediating doctrine of conceptualism (*q.v.*) was sufficiently near to obnoxious ideas to involve him in lifelong persecution. The principles of the great orthodox philosophers of the later scholastic period which begins in the 13th century, Albertus Magnus and Thomas Aquinas, were those of moderate realism. When nominalism was revived in the 14th century by the English Franciscan William of Occam it gave evidence of a new tendency in thought, a distrust of abstractions and an impulse toward direct observation and inductive research, a tendency which had its fulfilment in the scientific movement of the Renaissance. Occam's dictum *Entia non sunt multiplicanda praeter necessitatem* was inspired by a spirit similar to that of Francis Bacon. Though nominalism is properly a mediaeval theory, the tendency has passed over into modern philosophy; the term nominalist is often applied to thinkers of the empirical, sensationalist school, of whom J. S. Mill may be taken as the chief representative.

(H. St.)

NOMOGRAPHY, the science of calculating charts. Its object is the general study of the representation, by means of diagrams called nomograms, of mathematical laws (Gr. *nomos*, "a law") which are expressed analytically by means of equations. Such graphical devices, once carefully drawn, yield the solutions of complicated problems with speed and with slight labour. They are especially helpful when many numerical problems of a similar sort are to be solved and when high accuracy is not required. They can be used by a person without special knowledge or experience and without the mastery of a difficult technique.

The use of graphic schemes for computation goes back to antiquity. The graphic solution of spherical triangles was in vogue in the time of Hipparchus, 150 B.C., and simple charts were designed by the mathematicians of the middle ages. The publication of René Descartes's *Discours de la méthode* in 1637, which introduced analytic geometry to the world, gave a powerful impetus to graphical methods and provided their analytical background. The theory of nomograms rests largely on analytic geometry.

Co-ordinate Papers.—The use of squared paper for the representation of relations between two quantities is familiar in many fields. A point on the paper is located by giving its distance X to the right of a vertical axis and its distance Y above a horizontal axis (distances to the left and downward being reckoned negative). X and Y are called co-ordinates. An equation $f(X, Y) = 0$ is pictured by plotting the points whose co-ordinates satisfy the equation. The resulting graph is a line or curve from which corresponding values of X and Y may be determined visually. The eye is guided by the vertical rulings along which X is constant and the horizontal rulings along which Y is constant. The values of X and Y are commonly written along the axes.

It is clear that nothing is essentially changed if the values which are marked on the axes are not proportional to the distances from the origin but more or less arbitrary scales are used. Points whose co-ordinates satisfy a given equation can be plotted as before and a curve be drawn from which corresponding values can be read. The form of the curve can be altered and in some cases simplified. These notions were developed by Léon Lalanne in his *Anamorphose logarithmique* in 1842 and further advances were made by J. Massau and Charles Lallemand in the '80s. A basic idea is to use such scales that the graphs of the equations under consideration become straight lines, which are easy to draw. The equation $af(x) + bg(y) + c = 0$, where a, b, c are constants, becomes the straight line $aX + bY + c = 0$ if the distances X and Y along the axes to the marks x and y are determined by the functions in the equation; namely, $X = f(x)$, $Y = g(y)$.

Well-known examples based on this principle are the commercial logarithmic and semilogarithmic papers. The former papers use the scales $X = \log x$, $Y = \log y$ and are convenient for plotting the graphs of relations of the form $y^m = ax^n$. Since this may be written $m \log y = n \log x + \log a$, the graph on this paper is the straight line $mY = nX + \log a$. The semilogarithmic papers have the scales $X = x$, $Y = \log y$.

Fig. 1 shows a paper made with the scales $X = x^2$, $Y = y^2$. Thus, the points marked 1, 2, 3, . . . on the axes are at distances

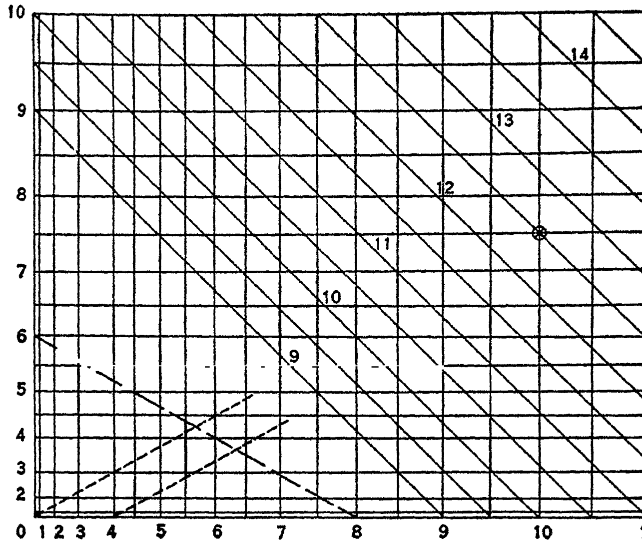

FIG. 1.—CO-ORDINATE PAPER WITH NONUNIFORM SCALES $X=x^2$, $Y=y^2$

1, 4, 9, . . . from the origin. The graph of the ellipse $\frac{x^2}{64} + \frac{y^2}{36} = 1$ is the broken line of the figure. The hyperbola $\frac{x^2}{16} - \frac{y^2}{9} = 1$ and its asymptotes $\frac{x^2}{16} - \frac{y^2}{9} = 0$ are the parallel lines made of short dashes. These simple graphs can be used for the usual purposes; for example, we read from the figure that the ellipse and hyperbola intersect at (6.3, 3.6).

An equation in three variables $F(X, Y, Z) = 0$ is represented in the cartesian system by a surface in three-dimensional space. To reduce the representation to a two-dimensional picture the use of contours is resorted to. Holding Z fixed, we have an equation in X and Y, whose graph is drawn. This is done for various values of Z and the values are written beside the curves. Other values of Z can be estimated visually. The resulting figure resembles a geographic map with contour lines upon it or a weather map showing isothermal lines or isobars.

We can sometimes reduce the contours to straight lines by a happy choice of scales on the axes. An equation of the form $p(z)f(x) + q(z)g(y) + r(z) = 0$ yields a straight line for each fixed z, say z_0, if we use the scales $X = f(x)$, $Y = g(y)$, since the equation now is linear in the variables: $p(z_0)X + q(z_0)Y + r(z_0) = 0$. For example, a chart for solving right triangles can be made from the equation $x^2 + y^2 = z^2$ by drawing contours across fig. 1. Giving z the values 9, 9.5, 10, etc., we get the heavy slanting lines of the figure. To find the hypotenuse of a right triangle whose sides are 10 and 7.5 we are led to the point marked in the figure, from which $z = 12.5$.

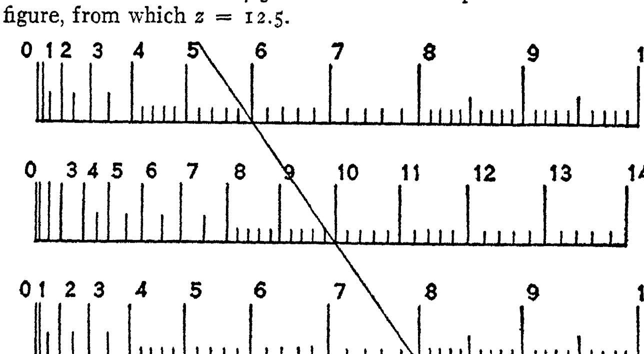

FIG. 2.—ALIGNMENT CHART FOR SOLVING $X^2+Y^2=Z^2$. FOR $X=6$, $Y=8$ THE LINE DRAWN SHOWS THAT $Z=10$

Alignment Charts.—The word nomogram is sometimes restricted to a special type of chart which is used by bringing the points of three scales into alignment. In fig. 2 is shown an alignment chart for the solution of $x^2 + y^2 = z^2$. On the upper and lower horizontal lines are laid off from a vertical axis the scales

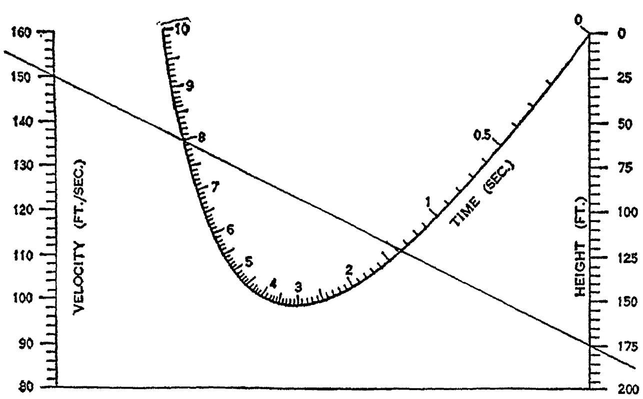
$X_1 = x^2$, $X_2 = y^2$ identical with those on the axes in fig. 1. Midway between is a line with a scale half as large, $X_3 = \frac{1}{2}z^2$. Now let a straight line be drawn across the figure cutting the scales at points marked x, y and z. It is seen from elementary geometry that $X_3 = \frac{1}{2}(X_1 + X_2)$, whence the equation $x^2 + y^2 = z^2$ is satisfied. The equation is solved for one of the variables by joining given values of the other two variables on the scales by a straight line and reading the solution where this line cuts the third scale.

A chart for solving any equation containing three variables can be made in a similar manner provided the variables can be segregated into three separate terms, $h(z) = f(x) + g(y)$. We have merely to plot the scales $X_1 = f(x)$, $X_2 = g(y)$ on the outside lines and $X_3 = \frac{1}{2}h(z)$ on the middle line. Thus, a scale for multiplication, $z = xy$, could be made after first writing the equation in the form $\log z = \log x + \log y$, the three plotted scales then being logarithmic.

This type of chart has certain obvious advantages. Only three scales need be drawn, and they are more easily used than a complicated diagram. Interpolation can be accurately done since the line cuts cleanly across the scale. As a practical matter the line across the chart should not be actually drawn since a few lines in pencil would mar the chart. A fine thread may be stretched across the chart. An excellent line may be made on a transparent ruler with the point of a knife, a little graphite being worked in to give it visibility, and this can be laid across the chart.

The principle of the alignment chart was first described in 1884 by Maurice d'Ocagne (1862–1938) of the École Polytechnique in Paris. He developed the subject in many papers and books and particularly in his treatise of 1899, *Traité de nomographie*, in which were brought together both the general theories and a multitude of practical applications. We may properly call D'Ocagne the creator of nomography.

In its more general forms the alignment chart for the solution of an equation in three variables may employ straight scales arranged in various ways, or one or more of the scales may be curved as in fig. 3. A curved scale may be constructed from parametric



$h = vt - 16t^2$

FIG. 3.—ALIGNMENT CHART FOR FINDING THE TIME AT WHICH A BODY THROWN UPWARD WITH A GIVEN VELOCITY ATTAINS A GIVEN HEIGHT (NEGLECTING FRICTION). THE LINE DRAWN SHOWS THAT FOR AN INITIAL VELOCITY OF 150 FT. PER SECOND THE BODY WILL BE 175 FT. HIGH IN 1.36 SEC. AND AGAIN (ON THE WAY DOWN) IN 8 SEC.

equations $X = f(t)$, $Y = g(t)$. A value of t gives a point (X, Y) on the curve. Points for suitably spaced values of t are marked and the value of t is attached. Thus, $X = \cos t$, $Y = \sin t$ gives a circular scale, since $X^2 + Y^2 = 1$. Whether the resulting scale is curved or straight depends upon the parametric equations.

Let us take two functions of a variable x, two functions of y and two functions of z. Let us use these to form three scales: an x scale $X_1 = F(x)$, $Y_1 = f(x)$; a y scale $X_2 = G(y)$, $Y_2 = g(y)$; and a z scale $X_3 = H(z)$, $Y_3 = h(z)$. Three points (X_1, Y_1), (X_2, Y_2) and (X_3, Y_3), corresponding to readings x, y and z, respectively, on the three scales lie on a line if the slope of the line joining the first two points is equal to the slope of the line joining the last two points; that is,

$$\frac{Y_2 - Y_1}{X_2 - X_1} = \frac{Y_3 - Y_2}{X_3 - X_2}$$

This condition may be put in the form

$$F(x)\,[g(y) - h(z)] + G(y)\,[h(z) - f(x)] + H(z)\,[f(x) - g(y)] = 0,$$

or as a determinant

$$\begin{vmatrix} F(x) & f(x) & 1 \\ H(z) & h(z) & 1 \\ G(y) & g(y) & 1 \end{vmatrix} = 0.$$

The chart will solve this equation for one of the variables when the other two are known. Conversely, an alignment chart can be made for any equation which can be written in this form.

If an equation can be solved by an alignment chart it can be solved by an infinitude of alignment charts. By applying a projective transformation

$$X' = \frac{a_1X + b_1Y + c_1}{a_3X + b_3Y + c_3}, \quad Y' = \frac{a_2X + b_2Y + c_2}{a_3X + b_3Y + c_3}$$

where the as, bs, cs are constants, to the plane of the chart we get another chart. The degree of a curve remains invariant, whence collinear points remain collinear and we still have an alignment chart for the equation. Because of the large number of constants at our disposal the chart can be thrown into a multitude of forms. Projective transformations are used to bring distant portions of a chart back on the page, to change the positions of scales so as to make the best use of the space on the page and to get convenient arrangements generally. The scales of fig. 3 consist of two parallel lines and a hyperbola. We could, for example, carry the linear scales into intersecting lines, or make the curved scale parabolic or circular, or greatly magnify some portion which we wish particularly to use. A useful result is that a convex quadrilateral covering any part of a chart can be carried into a rectangle of desired dimensions so that it will fit exactly on the page.

Nomograms have been widely used in engineering, in industry and in the physical and natural sciences. Equations in many variables are handled by using a sequence of scale alignments or by employing networks of scales, and a great diversity of problems can be solved.

NONCONFORMITY, LAW RELATING TO. (*See* BAPTISTS; CONGREGATIONALISM; ENGLISH HISTORY; FRIENDS, SOCIETY OF; METHODISM; etc.; also OATH.) It is proposed here to note the matters in which the law as to nonconformists still differs from that applicable to members of the Church of England.

(1) *Judicial Notice.* Where the tenets and authorities of a nonconformist body come in question they must be proved by evidence. By Lord Lyndhurst's act, the Nonconformist Chapels act, 1844, where no particular religious doctrine or mode of worship has been prescribed by the deed or instrument of trust the usage of the congregation for 25 years is to be taken as conclusive evidence of the doctrine and worship which may be properly observed in such meetinghouses. (2) *Tribunal.* Matters arising in nonconformist bodies can be tried only by the ordinary secular courts and generally depend upon the question whether a minister has done any act which is not in accordance with the rules governing the particular body of which he is a minister. A nonconformist body is in law nothing more than a voluntary association whose members may enforce discipline by any tribunal assented to by them but must be subject in the last degree to the courts of the realm. (3) *Status of Ministers.* A nonconformist minister is not in holy orders, and his chapel is not a consecrated building. His status is, however, recognized to a limited extent. By the Toleration act, 1 Will. and Mar., c, 18, a minister, preacher or teacher of a nonconformist congregation is exempt from certain parochial offices, as that of churchwarden. He is also exempt from serving in the reserve forces or on a jury. These privileges attach only

where the place of worship of which he is a minister has been duly registered (the Places of Worship Registration Act, 1855), unless in the case of bodies subject to special legislation as Quakers. By the Municipal Corporations Act, 1882, s. 12, a nonconformist minister (as is a clerk in holy orders) is disqualified from being elected an alderman or councillor of a town council, but under the Local Government Act, 1888, a clerk in holy orders, or other minister of religion, may be a councillor or alderman of a county council, and, under the London Government Act, 1899, of a metropolitan borough. (4) *Marriage.* The first act of parliament relieving dissenters (other than Jews and Quakers) from restrictions was the Marriage Act of 1836. By that act the ceremony of marriage might be performed in a nonconformist place of worship, but it must be after due notice to the superintendent registrar and in his presence or in that of a registrar, and the building must be one that is duly certified for marriages. The Marriage Act, 1898, dispensed with the necessity of the attendance of a registrar at marriages celebrated at a nonconformist place of worship, substituting in place thereof a person duly authorized by the trustees of the place of worship, if the persons intending to be married so desire; but the parties may, if they wish, still require the presence of the registrar. Marriage by banns, licence or special licence cannot take place except in a church. (*See* MARRIAGE.) (5) *Burial.* By the Burial Laws Amendment Act, 1880, burial may take place in a churchyard without the rites of the Church of England. But in such a case notice must be given in a specified form, which is unnecessary where the burial service is conducted by a clergyman of the Church of England. (*See* BURIAL.) (6) *Parish Offices.* By 1 Will. and Mar., c. 18, s. 5, a dissenter chosen churchwarden and scrupling to take the oaths may execute his office by deputy. His acceptance of office is made optional by the act; there is nothing to prevent his discharging it if he see fit to do so. This seems to be still the law, although a declaration was substituted for the oath by the Statutory Declarations Act, 1835, s. 9. (*See* DISSENTER; JEWS; ROMAN CATHOLICS.)

NONFEASANCE, MISFEASANCE, MALFEASANCE. The expressions "nonfeasance" and "misfeasance," and occasionally "malfeasance," are used in English law with reference to the discharge of public obligations existing by common law, custom or statute. The rule of law laid down is that no action lies for nonfeasance, *i.e.*, for failure or refusal to perform such obligation, but that an action does lie for damage resulting from misfeasance or malfeasance, *i.e.*, for negligently and improperly performing the obligation. (*See* NEGLIGENCE.) At present the terms misfeasance and nonfeasance are most often used with reference to the conduct of municipal authorities with reference to the discharge of their statutory obligations. In the case of nonfeasance there is a remedy by indictment or *mandamus* or by the particular procedure prescribed by the statutes. This rule is fully established in the case of failure to repair public highways; but in other cases the courts are astute to find evidence of carelessness in the discharge of public duties, and on that basis to award damages to individuals who have suffered thereby. Misfeasance is also a term used with reference to the conduct of directors and officers of joint-stock companies.

NONIUS MARCELLUS, Latin grammarian and lexicographer, flourished at the end of the 3rd or the beginning of the 4th century A.D. He is the author of a sort of lexicon called *De compendiosa doctrina,* in 20 sections or chapters, the first twelve of which deal with language and grammar, the remaining eight with special subjects (navigation, costume, food, arms). It is valuable as preserving fragments from old dramatists, annalists, satirists and antiquarian writers. In the quotations from the authors cited Nonius always follows the same order, beginning with Plautus and ending with Varro and Cato. In the 5th century Julius Tryphonianus Sabinus brought out a revised and annotated edition.

Editions by L. Müller (1888); J. H. Onions, bks. i.–iii. (1895); W. M. Lindsay (1903).

NONJURORS, the name given to those beneficed clergy of the Church of England who refused to take the oaths of allegiance to William and Mary in 1689. They were about 400 in number, and included William Sancroft, archbishop of Canterbury, and four others of the "seven bishops": Thomas Ken of Bath and Wells, John Lake of Chichester, Thomas White of Peterborough and Francis Turner of Ely, together with the bishops of Gloucester, Worcester and Norwich. Other distinguished nonjurors were: William Sherlock, master of the Temple, Jeremy Collier, the ecclesiastical historian, George Hickes, dean of Worcester, Nathanael Spinckes, John Fitzwilliam, canon of Windsor, Henry Dodwell, Camden professor of history at Oxford, Henry Hyde, second earl of Clarendon, and Roger North, the lawyer. Afterwards their number was augmented by refusals to swear the oaths of allegiance to George I. Ken, the most eminent of the nonjurors, disapproved of their subsequent proceedings, and Sherlock and Dodwell afterwards took the required oaths, the former becoming dean of St. Paul's.

Believing in the doctrine of non-resistance to established authority, the nonjurors argued that James II. was still the rightful king, and likened the position of William to that of Cromwell. With the approval of William III., Gilbert Burnet, bishop of Salisbury, attempted to reconcile them to the new order; and it was only when the generous terms offered by Burnet had been refused, that, in Feb. 1690, they were deprived of their sees and other benefices. Although they had only a small following among the mass of the people, who were not required to take the oaths of allegiance, Sancroft and his colleagues claimed to represent the true Church of England, and requested James II. in his exile to nominate two new bishops to carry on the episcopal succession. James chose Hickes and Thomas Wagstaffe (1645–1712), who were consecrated in 1694 as bishops of Thetford and Ipswich respectively. A further consecration took place in 1713 when Collier, Spinckes and Samuel Hawes (d. 1722), were consecrated "bishops at large." In 1718 the introduction of a new communion office with some "usages" taken partly from primitive liturgies, and partly from the first prayer-book of Edward VI. caused a schism among the nonjurors, dividing them into "Usagers" and "Non-Usagers." The four "usages" were: The mixed chalice, prayers for the faithful departed, prayer for the descent of the Holy Ghost on the consecrated elements, and the Oblatory Prayer, offering the elements to the Father as symbols of His Son's Body and Blood. Accepting the "usages" the two bodies united in 1731, but other dissensions followed, although the episcopal succession was maintained until the death of a bishop named Charles Booth in 1805. The last nonjuror was probably James Yeowell, who died in 1875. Public worship was conducted in chapels or "oratories," and in private houses.

In Scotland the nonjurors included the greater part of the clergy of the Episcopal Church, which ceased to be the state church in 1689. The Scottish clergy maintained their opposition to the government until the death of Prince Charles Edward Stuart in 1788, when the bishops met at Aberdeen, and unanimously agreed to submit to the government of King George III. A large number of the Presbyterians in Scotland, principally found among the Cameronians, also refused to take the oaths of allegiance to William and Mary; but as their reasons for this refusal were quite different from those of the episcopalian nonjurors, they are not usually referred to by this name (*see* CAMERONIANS).

For the history of the nonjurors, *see* Macaulay, *History of England* vol. ii. (1895); T. Lathbury, *History of the Nonjurors* (1845); J. H. Overton, *The Nonjurors* (1902), a defence of the sect.

NONNUS (Egyptian for "saint"), Greek epic poet, a native of Panopolis (Akhmim) in the Egyptian Thebaid, probably lived at the end of the 4th or beginning of the 5th century A.D. His principal work is the *Dionysiaca,* an epic in 48 books, the main subject of which is the expedition of Dionysus to India and his return, a subject convenient at the time owing to the popular comparison of Alexander with Dionysus. In its luxuriance and preoccupation with action, it resembles the Indian epics. His chief merit consists in the systematic perfection to which he brought the Homeric hexameter, but this very quality tends to monotony. His influence on later poetic vocabulary was considerable.

We also possess under his name a paraphrase (*μεταβολή*) of the

Gospel of St. John, which is chiefly interesting as apparently indicating that Nonnus in his later years was a convert to Christianity. His style, in this content, produces an impression of extreme bombast and want of taste. According to an epigram in the Palatine Anthology (ix. 198), Nonnus was also the author of a *Battle of the Giants,* and four lines of the *Bassarica* (also on Dionysus) have been preserved in Stephanus of Byzantium.

Editio princeps (1569); H. Köchly ("Teubner" series, with critical introduction and full index of names, 1858); the most generally useful edition is that by the comte de Marcellus (1856), with notes and prolegomena, and a French prose translation. On the metre, *see* J. G. Hermann, *Orphica* (1805), p. 690; A. Ludwich, *Beiträge zur Kritik des Nonnus* (1873), critical, grammatical and metrical; C. Lehrs, *Quaestiones epicae* (1837), pp. 255–302, chiefly on metrical questions; on the sources, R. Köhler, *Über die Dionysiaka des Nonnus* (1853), a short and connected analysis of the poem, with a comparison of the earlier and later myths; *see* also I. Negrisoli, *Studio critico . . . Nonnus Panopolita,* with short bibliography (1903). The paraphrase on St. John (editio princeps, *c.* 1505) is edited by F. Passow (1834) and A. Scheindler (1881), with complete index.

NONPAREIL (*see* PRINTING; PRINTING TYPE), a size of type smaller than minion and larger than ruby. It is also known as 6-point. It is mainly used for footnotes. The following matter is printed in nonpareil:

In Europe, as late as the second half of the 14th century, every book and every public and private document was written by hand; all figures and pictures, even playing cards and images of saints, were drawn with the pen or painted with the brush.

NONPAREIL or **PAINTED BUNTING,** a small, brilliantly coloured finch (*Passerina ciris*) with blue head, green-yellow back, scarlet body and black wings and tail. After wintering in Central America, the painted bunting arrives in the southern states of the U.S.A. in April, and breeds north to Virginia, Ohio and Kansas. The "pin-tailed nonpareil" of Africa (*Erythrura prasina*) is blue in colour; the male has a long tail. It belongs to the *Ploceidae.* (*See* WEAVER-BIRD.)

NONPARTISAN LEAGUE, an American political and economic organization of farmers founded by Arthur C. Townley at Bismarck, N.D., in Feb. 1915. For years the farmers of the State had complained of exploitation by grain speculators, bankers and politicians. The 1915 session of the legislature, at which members of the Equity Society—a farm organization—received scant attention, fanned agrarian discontent into immediate flame. The Nonpartisan League, applying modern sales methods, rapidly organized the farmers into a cohesive political body, which captured control of the State Republican Party and elected its candidates for State offices and Congress. In 1916 the league began work outside North Dakota, and eventually established active organizations in 12 other Western and Middle Western States, where influence was exerted in behalf of sympathetic candidates with varying degrees of success. Though confining its own membership to farmers, the league regularly co-operated with urban labour in political action. During the World War the league was bitterly attacked on the ground of the socialist connection of some of its leaders and its advocacy of conscription of wealth to pay for the hostilities. In 1919 the league put its economic programme into effect in North Dakota. A State-owned bank, mill and terminal elevator, home-building association, and hail, fire and tornado insurance constituted the principal enterprises. All of these, except the home-building association, were still in operation in 1928. The league, as such, gradually disintegrated, though not before it had given birth to the Farmer-Labor Party in Minnesota and had stimulated many farmers to "non-partisan" voting.

BIBLIOGRAPHY.—Because of the bitter controversy over the league, little unbiased discussion exists. *See* H. E. Gaston, *The Nonpartisan League* (1920), and C. E. Russell, *Story of the Nonpartisan League* (1920) both sympathetic, while A. A. Bruce, *The Nonpartisan League* (1921) is hostile. The files of the *Nonpartisan Leader* (later the *National Leader*), which was published up to July 1923, give a running account of the league's work. (N. A. C.)

NON-SHATTERABLE GLASS: *see* GLASS, SAFETY.

NONSUIT, in law, the name given to a judgment whereby an issue is determined against the plaintiff. It was a term peculiar to the English common-law courts before the Judicature Acts, and was simply the expression of the opinion of the court that, apart from the merits, the plaintiff's case was incomplete. It did not in any way act as a bar to his bringing another action for the same cause. Although judgment of nonsuit still exists, it has, since the Judicature Acts, the same effect as a judgment on the merits, unless the court otherwise directs.

In the United States, litigants often take a "nonsuit" when a case has been settled out of court or they realize the futility of further proceedings.

NOODT, GERHARD (1647–1725), Dutch jurist, was born at Nijmegen in 1647. Educated at Leyden, Utrecht and Franeker, he became a professor of law at Leyden. As a writer on jurisprudence he acquired a wide reputation. His Latin style was modelled after the best writers, and his numerous works soon rose to the rank of standard authorities. Two of his political treatises were translated into French by Jean Barbeyrac, and appeared at Amsterdam in 1707 and 1714, under the respective titles of *Pouvoir des souverains* and *Liberté de conscience.*

The first edition of his collected works was published at Leyden in 1724 and the last in 1767. That of 1735 and those subsequent contain a life of the author by Barbeyrac.

NOON, midday, 12 o'clock. The O. Eng. *nón,* Nor. *non,* Dutch *noen,* are all from Lat. *nona* sc. *hora,* the ninth hour; *i.e.,* according to the Roman system, three o'clock P.M. The early uses of noon till the 13th and 14th centuries are either as translating the Latin, especially with reference to the Crucifixion, or as equivalent to the canonical hour of "Nones."

The ordinary word for 12 o'clock was *middaeg,* midday, also the equivalent of the canonical hour "Sext." Both the office and the meal taken about that time were shifted to an earlier hour, and by the 14th century the ordinary use of "noon" is that current today.

NORA, an ancient town of Sardinia, 22 mi. by road S.W. of Carales. It was founded, according to Pausanias, by the Iberians under Norax, son of Hermes, and was the most ancient town in the island. Discoveries made on the site, however, showed that it was of Phoenician origin. In Roman times, the milestones on the road from Nora to Bitia and even on that from Nora to Carales were reckoned from Nora (*Corp. inscr. Lat.,* x, 831; *Ephemeris epigraphica,* viii, 180). The sepulchral inscriptions found there, however, gave no information as to its juridical condition. The town occupied a characteristically Phoenician site, a small peninsula joined to the mainland by an isthmus, low, narrow and sandy. Excavations led to the discovery of Phoenician buildings, the foundations of a temple of Tanit, a road, quay walls at the water's edge and a watchtower on the extremity of the peninsula which rose to about 150 ft. above the sea. One cemetery which was found was of the 7th–6th century B.C. and consisted of tombs cut in the rock for inhumation. In another cemetery, going down to the 4th century B.C., cremation was the rule; there were ossuaries, or depositories for bones, placed in holes in the sand, with a sculptured stele over each. A quantity of small objects, gems, ivories, glass, vases, terra cottas, etc., were found; in some of them Egyptian, in others Greek, influence and importation were apparent. To the Roman period belong an aqueduct, which brought the water from the neighbouring hills, scanty remains of an amphitheatre, a theatre, considerable ruins of concrete foundations (perhaps of villas by the sea) and a watchtower on the promontory close to the Phoenician tower.

NORBA, an ancient town of Latium (*Adjectum*), It. It was 1 mi. N.W. of the modern Norma, 1,575 ft. above sea level, on the west edge of the Volscian mountains or Monti Lepini, above a precipitous cliff, with a splendid view over the Pomptine marshes. It was a member of the Latin league of 499 B.C., and became a Latin colony in 492 B.C., as an important fortress guarding the Pomptine marshes. It served in 199 as a place of detention for the Carthaginian hostages, and was captured and destroyed by Sulla's troops during the civil wars at the end of 82 B.C. Some revival in prosperity took place later.

NORBANUS, GAIUS, surnamed BULBUS or BALBUS, Roman politician, was a seditious and turbulent democrat. In 103 B.C., when tribune of the people, he accused Q. Servilius Caepio of having brought about the defeat of his army by the Cimbri through rashness and also of having plundered the temple

of Tolosa. Caepio was condemned and went into exile. About ten years later Norbanus himself was accused of treason because of the disturbances that had taken place at the trial of Caepio, but the eloquence of M. Antonius, grandfather of the triumvir, procured his acquittal. In 89 Norbanus as praetor successfully defended Sicily against the Italian socii. During the civil war between Marius and Sulla he sided with the former, but was defeated by Sulla at Mount Tifata near Capua and again by Metellus at Faventia in cisalpine Gaul (82). He fled to Rhodes, where he committed suicide while the Rhodians were debating whether to hand him over to Sulla.

NORD, the most northern department of France. Area 2,229 sq.mi. Pop. (1946) 1,917,452. Bounded for 21 mi. by the North sea, it has Belgian territory on the northeast and east. It lies below and parallel to the chalk scarp of Artois, famous for its defense in World War I. The coast is formed largely of sand dunes drained by canals. The department is crossed by the Scheldt (Escaut) with its tributaries and by the Sambre, the chief tributary of the Meuse. The climate of Nord is colder than that of France in general, the mean temperature being 49° or 50° F. Average annual rainfall is about 28 in.

In agricultural and industrial importance Nord is the first of French departments. In the southeast stock raising flourishes; in the central zone beetroot is characteristic, while mixed farming prevails in the northwest. Cereals (especially wheat and oats) and potatoes are grown in abundance, while flax, tobacco, chicory, colza and hops are minor crops. Market gardening and horticulture are practised in some localities. There are mineral springs, notably at St. Amand, where the mud baths are used in the treatment of rheumatism. The mineral wealth lies chiefly in coal mines forming part of the Valenciennes basin, the most important in France, which extends into Belgium and Pas-de-Calais. The textile industry centres in Lille, Roubaix and Tourcoing, which spin and weave cotton, linen and wool, as also around Fourmies. Other centres are Armentières (cloth weaving), Dunkirk (flax, jute and hemp spinning), Cambrai (batiste and other delicate fabrics; also chicory), Douai, Avesnes, le Cateau and Caudry. Other great industries are glass, brick, pottery and sugar manufacture, alcohol distilling, dyeing, iron founding and steel production. Branches of the metallurgical industry are at Denain, Hautmont, Maubeuge, Valenciennes, Douai, Raismes, etc. Dunkirk and Gravelines equip fleets for the cod and herring fisheries. Dunkirk is the chief port. Its system of inland navigation is highly developed, comprising a line of waterways from the Scheldt to the North sea at Dunkirk, with which the coal basin of Valenciennes is linked by the canalized Scheldt and the textile region of Lille by means of the Deûle canal and the canalized Lys.

The department is divided into six *arrondissements* (Avesnes, Cambrai, Douai, Dunkirk, Lille, Valenciennes) with 68 cantons and 665 communes. It forms the archiepiscopal diocese of Cambrai and part of the region of the 1st army corps (headquarters at Lille) and of the educational division of Lille. Its court of appeal is at Douai.

NORDAU (originally SÜDFELD), **MAX SIMON** (1848–1923), Jewish Hungarian author, was born at Budapest on July 29, 1849, and practised medicine in his native town. He made his name by his pseudo-philosophical *Entartung* (Eng. trans., *Degeneration,* 1895), which was translated into many languages, and had a great vogue. Other works were *The Conventional Lies of Society* (Eng. version, 1895) and *Biologie der Ethik* (1921). Nordau was an ardent Zionist, and took Theodor Herzl's side in wishing to accept the British government's offer of land for a Jewish settlement in East Africa.

In 1903 an attempt was made on his life by a Jew opposed to the scheme. He died on Jan. 22, 1923.

His works include novels and stories: *Gefühlskomödie* (1892), *Die Drohnenschlacht* (1897), *Morganatisch* (1904), etc.; dramas: *Das Recht zu lieben* (2nd ed., 1894), *Doktor Kohn* (1898) and others; some books of travel; and the critical works *Zeitgenössische Franzosen* (1901) and *Von Kunst und Künstlern* (Leipzig, 1905).

NORDENSKIÖLD, NILS ADOLF ERIK, BARON (1832–1901), geographer and arctic explorer, was born at Helsingfors, on Nov. 18, 1832. He was the son of Nils Gustav Nordenskiöld, a mineralogist and a traveller. Compelled to leave Russia for political reasons, he settled at Stockholm. He received an offer from Otto Torell, the geologist, to accompany him on an expedition to Spitsbergen. To the observations of Torell on glacial phenomena Nordenskiöld added the discovery at Bell sound of remains of Tertiary plants, and on his return became professor and curator of the mineralogical department of the Swedish State museum. In 1861 he took part in Torell's second Spitsbergen expedition. Of the further expedition to the same quarter promoted by the Swedish academy of science in 1864, Nordenskiöld was the leader. Four years later he headed an expedition in the iron steamer "Sofia," and reached the highest northern latitude (81° 42′) then attained in the eastern hemisphere. In 1870, with three young naturalists, he visited the vast inland ice sheet of Greenland. On his next expedition in 1872 the tenders were caught in the ice, and the crews of the three vessels were forced to winter in Spitsbergen. In 1875–76, however, a successful voyage eastward, including the ascent of the Yenisei, led him to attempt the discovery of the long-sought Northeast Passage. Starting from Karlskrona on June 22, 1878, in the "Vega," he doubled Cape Chelyuskin in the following August, and after being frozen in at the end of September near Bering strait, completed the voyage successfully in the following summer.

On his return to Sweden he received an enthusiastic welcome, and in April 1880 was made a baron and a commander of the Order of the Nordstjerna. In 1883 he again visited the east coast of Greenland, and succeeded in forcing through the great ice barrier, a feat attempted in vain during more than three centuries. He died at Stockholm on Aug. 12, 1901.

Baron Nordenskiöld also published *Facsimile Atlas* (1889) and *Periplus* (1897). The former contains reproductions of geographical documents printed during the 15th and 16th centuries, and the latter, a work of far greater research, deals with the history of early cartography and the sailing charts in use among mariners during the middle ages.

NORDENSKJÖLD, OTTO (1869–1928), Swedish explorer, was born in 1869; his father was a brother of Baron A. E. Nordenskiöld (*q.v.*). He specialized in geology in the University of Uppsala and after travels in Tierra del Fuego and Alaska, he led an expedition (Oct. 1901) to the South Polar regions. He landed at Snow Hill Island, off the east coast of Graham Land. Weather conditions made it impossible for the "Antarctic," which had continued her course to Tierra del Fuego, to relieve them in 1902–03, and she sank in the attempt. After several attempts at rescue had been made, they were eventually brought back by a vessel sent by the Argentine government in Nov. 1903. ("*Antarctic*" *Två år bland sydpolens isar,* 2 vol., Stockholm, 1904; Eng. trans., *Antarctica,* 1905). In 1920–21 Nordenskjöld explored the Peruvian and Chilean Andes. He died on June 3, 1928.

NORDERNEY (*i.e.,* "northern island"), the largest of the East Friesland group, Germany. Pop. (1933) 5,068. It is 8 mi. long and about 1½ mi. broad and is reached by steamer from Norddeich, Bremerhaven or Hamburg, and at low tide by road. The village is a popular resort. Norderney is associated with Heinrich Heine's *Nordseebilder.*

NORDHAUSEN, a town in the *Land* of Saxony, Germany. It is situated on the Zorge to the south of the Harz mountains, at the west end of the Goldene Aue (Golden Plain), a fruitful valley watered by the Helme. Pop. (1939) 42,267. Nordhausen possessed a royal palace in 874 and a convent was founded there in 962. It was destroyed by Henry the Lion in 1180, but was soon rebuilt and was made a free imperial town in 1253. In this and the following century several diets and other assemblies were held there. The protector (*Vogt*) of the town was the elector of Saxony and from 1702 to 1715 the elector of Brandenburg. Nordhausen accepted the reformed doctrines in 1522. It was annexed by Prussia in 1803 and again in 1815, having in the meantime belonged to the kingdom of Westphalia. The upper and lower parts of the town are connected by flights of steps. Among its churches the most noteworthy are the Roman Catholic cathedral, late Gothic with a Romanesque crypt, and the Protestant church of St. Blasius. Near the mediaeval town hall stands a Roland's

column, the ancient symbol of free commercial intercourse and civic liberty. The chief importance of the place arises from its distilling of "Korn Schnapps," a spirit somewhat akin to whisky.

NORDICA, LILLIAN (1859–1914), American operatic soprano, was born at Farmington (Me.), May 12, 1859, trained at Boston, and later at Milan, under Sangiovanni. She made her début at Brescia in 1879, sang at Covent Garden, London (1887–93), and at the Metropolitan Opera House, New York, after 1895. She died at Batavia, Java, May 10, 1914.

NÖRDLINGEN, German town in the Swabian province of Bavaria, on the Eger. Pop. (1939) 8,827. From 898, when first mentioned, to 1215 Nördlingen was subject to the bishops of Regensburg, but about 1215 it became a free city of the Empire. It was annexed to Bavaria in 1803. It is still surrounded with walls and towers. The church of St. George is a Gothic structure erected in the 15th century and restored in 1880. The Late Gothic town hall has a collection of pictures and antiquities.

Military Operations.—Nördlingen was the scene of two great battles in the Thirty Years' War (*q.v.*). In the first, which was fought on Sept. 5 and 6, 1634, the hitherto invincible Swedish army, commanded by Duke Bernhard of Saxe Weimar and Marshal Horn, was defeated with great loss by a somewhat superior army of Imperialists and Spaniards under Gen. Gallas, Horn being taken prisoner. In the second battle, fought 11 years later (Aug. 3, 1645), Condé (then duke of Enghien) and Turenne were the leaders on the one side, and Mercy and Johann von Weert, the dashing cavalry commander whose onset had decided the battle of 1634, on the other. The Germans were posted some 5m. to the east of Nördlingen, about Allerheim. In rear of the village the plain was occupied by Mercy's army in the customary two lines, foot in the centre, horse in the wings. The French army, similarly arrayed, was more heterogeneous than the German. After a cannonade in which it suffered more severely than its entrenched enemy, the French centre furiously attacked the village of Allerheim; the fighting here was very heavy, and on the whole in favour of the Germans, although Mercy was killed. The right wing of the French cavalry was swept off the field by Johann von Weert's charge, but the German troopers, intoxicated with success, dispersed to plunder. On the French left, meanwhile, Turenne saved the day. Fighting cautiously at first with his leading line to gain time for his second to come up, he then charged and broke up the hostile right wing of cavalry, while some battalions of infantry scaled the hill and captured the Bavarian guns. Unlike Weert the marshal kept his troops in hand, and swung round upon the Bavarian infantry behind Allerheim, who were at the same time cannonaded by their lost guns. A prolonged fight now ensued, in which the Bavarians had the worst of it, and Weert, returning at last to the field, dared not attempt to engage afresh. The armies faced one another all night with their sentries 50 paces apart, but in the morning the Bavarians were found to have retreated. Nothing was gained by the victors but the trophies and the field of battle, and the losses of both sides had been enormous. Nördlingen, therefore, is a classical instance of the unprofitable and costly *bataille rangée* of the 17th century.

See Beyschlag, *Geschichte der Stadt Nördlingen* (Nördlingen, 1851), and Mayer, *Die Stadt Nördlingen, ihr Leben und ihre Kunst im Lichte der Vorzeit* (Nördlingen, 1856).

NORE, THE, sandbank at the mouth of the river Thames, England, marked by buoys and a lightship, with revolving light. This ship lies 3 m. from the Kent coast, about the same from the Essex coast, and 47¾ m. below London Bridge. The first light was placed as an experiment by Mr. Hamblin, its patentee, in 1732.

NORFOLK, EARLS AND DUKES OF. The 1st earl of Norfolk was Ralph de Guader, a follower of William the Conqueror, who forfeited the earldom when he revolted against William in 1075; the 2nd was Hugh Bigod (d. 1177), one of Stephen's supporters, to whom the earldom was granted by this king before 1141. Hugh's grandson, Hugh (d. 1225), the 3rd earl of this line, married Matilda, daughter of William Marshal, earl of Pembroke, and from the Marshals their son Roger (d. 1270), the 4th earl, inherited the office of marshal of England. This powerful family of Bigod retained the earldom until Roger, the 5th earl, died childless in Dec. 1306.

The next earl of Norfolk was Thomas of Brotherton (1300–1338), a younger son of Edward I., to whom the earldom was granted in 1312 by his half-brother, Edward II. In addition to the estates which had formerly belonged to the Bigods Thomas received the office of marshal. He joined Queen Isabella when she landed in England in 1326, and was one of the group of nobles who brought about the deposition of Edward II. He died in August 1338, leaving no son. The survivor of his two daughters, Margaret (*c.* 1320–1400), who was countess of Norfolk in her own right, married John de Segrave, 3rd Lord Segrave (d. 1353), and their only child Elizabeth (d. *c.* 1375) became the wife of John de Mowbray, 4th Lord Mowbray (d. 1368), and the mother of two sons John and Thomas. In 1397 the countess Margaret was created duchess of Norfolk, and at the same time her grandson Thomas Mowbray was made duke of Norfolk.

On the death of John Mowbray, 4th duke of this creation, in 1476 the dukedom became extinct, but the earldom passed to his daughter Anne, wife of the young Richard, duke of York, who was murdered in the Tower with whom the earldom became extinct.

The dukedom was given in 1483 to John Howard whose mother, Margaret Mowbray, was a daughter of Thomas Mowbray the 1st duke. The dukedom has remained in the Howard line until the present day. (*See* Howard.)

NORFOLK, HENRY FITZALAN HOWARD, 15th Duke of (1847–1917), was born in London on Dec. 27, 1847, and succeeded his father, the 14th duke, in 1860. He was educated at the Oratory School, Edgbaston, and then spent some time with his uncle, Lord Lyons, in Constantinople. The duke was post-master-general from 1895 to 1900, first Lord Mayor of Sheffield in 1895, and served in the yeomanry in the South African War. His position as head of the English Roman Catholics and as premier duke and Earl Marshal made him for many years conspicuous in public life. He was throughout his life in close connection with the Vatican, and was sent by Queen Victoria in 1887 on a special mission to Leo XIII. He did not always agree with the policy of the Irish Catholic hierarchy, but he did much for Catholic education in Ireland. He was keenly interested in education generally; was one of the founders of Sheffield University, and its first vice-chancellor. The duke was concerned in the building of many Catholic churches in England, notably the church of St. John the Baptist at Norwich. He died in London on Feb. 11, 1917.

NORFOLK, JOHN HOWARD, 1st Duke of (of the Howard line) (*c.* 1430–1485), was the son of Sir Robert Howard by his wife Margaret, daughter of Thomas Mowbray, the first duke of that family. In 1455 John Howard was sent to parliament as member for Norfolk, although he "hadde no lyvelode in the shire"; in 1461 he was knighted; and in 1470, although he appears to have been a consistent Yorkist, he was created a baron by Henry VI. He was treasurer of the royal household from 1467 to 1474, and went to France with Edward IV. in 1475. After Edward's death, however, he supported Richard III., who created him duke of Norfolk and made him earl marshal of England in June 1483. He was killed at Bosworth whilst fighting for this king on Aug. 22, 1485, and the title thus suffered attainder.

NORFOLK, THOMAS HOWARD, 2nd Duke of (1443–1524), son of the preceding, shared his father's fortunes; he fought at Barnet for Edward IV. and was made steward of the royal household and created earl of Surrey in 1483. Taken prisoner at Bosworth he was attainted and remained in captivity until January 1489, when he was released and restored to his earldom but not to the dukedom of Norfolk. He was then entrusted with the maintenance of order in Yorkshire and with the defence of the Scottish borders; he was made lord treasurer and a privy councillor in 1501, and he helped to arrange the marriage between Margaret, the daughter of Henry VII., and James IV. of Scotland. Henry VIII., too, employed him on public business, but the earl grew jealous of Wolsey, and for a short time he absented himself from court. He commanded the army which defeated the Scots at Flodden in September 1513, and was created duke of Norfolk in February of the following year, with precedency as

of the creation of 1483. In his later years Norfolk worked more harmoniously with Wolsey. He was guardian of England during Henry's absence in France in 1520, and he acted as lord high steward at the trial of his friend Edward Stafford, duke of Buckingham, in 1521. Among his sons were William, 1st Lord Howard of Effingham (1510?–1573), and Sir Edward Howard (*c.* 1477–1513), lord high admiral, who defeated the French fleet off Brest in August 1512, and died during an engagement in April 1513.

NORFOLK, THOMAS HOWARD, 3RD DUKE OF (1473–1554), eldest son of the 2nd duke, married in 1495 Anne (1475–1512), daughter of Edward IV., thus becoming a brother-in-law of Henry VII., who had married Anne's sister Elizabeth. He became lord high admiral in 1513, and led the van of the English army at Flodden in September, being created earl of Surrey in February 1514. In 1513 he took for his second wife Elizabeth (d. 1558), daughter of Edward Stafford, duke of Buckingham. In 1520 Surrey went to Ireland as lord-deputy, but soon vacated this post to command the troops which sacked Morlaix and ravaged the neighbourhood of Boulogne in 1522; afterwards he raided and devastated the south of Scotland. He succeeded his father in May 1524, and as the most powerful nobleman in England he headed the party hostile to Cardinal Wolsey. He favoured the divorce of Henry VIII. from Catherine of Aragon, and the king's marriage with his niece Anne Boleyn. In 1529 he became president of the council, but in a few years his position was shaken by the fate of Anne Boleyn, at whose trial and execution he presided as lord high steward. But his military abilities rendered him almost indispensable to the king, and in 1536, just after the rising known as the Pilgrimage of Grace had broken out, he was despatched into the north of England; he temporized with the rebels until the danger was past, and then, as the first president of the council of the north, punished them with great severity. Sharing in the general hatred against Thomas Cromwell, Norfolk arrested the minister in June 1540. He led the English army into Scotland in 1542 and into France in 1544; but the execution of Catherine Howard, another of his nieces who had become the wife of the king, had weakened his position.

His son Henry Howard, earl of Surrey (*q.v.*), was arrested on a charge of treason; Norfolk himself suffered the same fate as accessory to the crime. In January 1547 Surrey was executed; his father was condemned to death by a bill of attainder, but owing to the death of the king the sentence was not carried out. Norfolk remained in prison throughout the reign of Edward VI., but in August 1553 he was released and restored to his dukedom. Again taking command of the English army he was sent to suppress the rebellion which had broken out under Sir Thomas Wyat, but his men fled before the enemy. He acted as lord high steward at the trial of John Dudley, duke of Northumberland; and he died on Aug. 25, 1554. Norfolk was a brutal and licentious man, but was a supporter of the Roman church, being, as he himself admits, "quick against the sacramentaries."

NORFOLK, THOMAS HOWARD, 4TH DUKE OF (1536–1572), son of Henry Howard, earl of Surrey, was born on March 10, 1536. His tutor was John Foxe, the martyrologist. Norfolk, who had already been married three times, was regarded as a suitable husband for Mary queen of Scots, who had just taken refuge in England. He presided over the commission appointed by Elizabeth to inquire into the relations between the Scottish queen and her subjects; and although he appears to have believed in Mary's guilt he was anxious to marry her. Among the Scots Maitland of Lethington favoured the proposed union; Mary herself consented to it; but Norfolk was unwilling to take up arms, and while he delayed, Elizabeth ordered his arrest and he was taken to prison in October 1569. In August 1570, after the suppression of the rising in the north of England, the duke was released; but he entered into communication with Philip II. of Spain regarding the proposed invasion of England by the Spaniards. After some hesitation Norfolk placed himself at the head of the conspirators; and in return for his services he asked the king of Spain "to approve of my own marriage with the Queen of Scots" But the plot failed; Norfolk's treachery was revealed to Lord Burghley, and in September 1571 he was arrested. He was beheaded on June 2, 1572. He always regarded himself as a Protestant. Norfolk's first wife, Mary (1540–1557), daughter and heiress of Henry Fitzalan, 12th earl of Arundel, bore him a son, Philip, who in consequence of his father's attainder was not allowed to succeed to the dukedom of Norfolk, but became 13th earl of Arundel in succession to his maternal grandfather in 1580. Norfolk left two other sons, Thomas Howard, created earl of Suffolk in 1603, and Lord William Howard (*q.v.*).

NORFOLK, THOMAS MOWBRAY, 1ST DUKE OF (*c.* 1366–1399), son of John de Mowbray, 4th Lord Mowbray, was created marshal of England for life in 1385. He was then Lord Mowbray and earl of Nottingham. In 1387 Nottingham began to act with Thomas of Woodstock, duke of Gloucester, his own brother-in-law, Richard Fitzalan, earl of Arundel, and the party of nobles who wished to deprive the king of his power. They routed the royal favourite Robert de Vere, earl of Oxford, at Radcot Bridge, and Richard was at their mercy. Owing partly to Nottingham's moderate counsels the suggestion to depose him was not carried out, but in the "merciless parliament" of 1388 his favourites were "appealed" of treason and were sentenced to death. For nearly two years the chief power was in the hands of the lords appellant, as Nottingham and his friends were called, but in 1389 the king regained his authority. He detached Nottingham from his colleagues and made him warden of the Scottish marches; later he became captain of Calais and the royal lieutenant in the north-east of France. Richard took him to Ireland in 1394 and soon afterwards sent him to arrange a peace with France and his marriage with Isabella, daughter of King Charles VI. But the earl's supreme service to the king was in 1397 when Richard took a tardy but severe vengeance upon three of the appellants. In their turn these lords were "appealed" of treason before the parliament, and as on the former occasion Nottingham was one of the accusers. He was present when Gloucester was arrested at Pleshey, and Froissart says that he actually beheaded Arundel himself. Gloucester was entrusted to his keeping at Calais, and in September 1397 he reported that his prisoner was dead. The duke had been murdered, and Nottingham was probably responsible, although the evidence against him is not conclusive. As a reward he received most of Arundel's lands in Surrey and Sussex, and was created duke of Norfolk. He now began to fear for his own safety, and took the duke of Hereford, afterwards King Henry IV., into his confidence. Hereford carried his words to the king, who summoned him to his presence, and at Oswestry Norfolk accused Hereford of speaking falsely. A court of chivalry decided that the dispute should be referred to the arbitrament of single combat at Coventry; but when everything was ready (Sept. 16, 1398) for the fight Richard interposed and ordered both combatants into banishment. Norfolk was deprived of his offices, but not of his titles; he left England for Dordrecht, and after passing some months in wanderings he reached Venice, where he died on Sept. 22 or 27, 1399. The concluding scene of the duke's life in England forms the staple material of act i. of Shakespeare's *Richard II.*

NORFOLK, an eastern county of England, bounded north and east by the North sea, south-east and south by Suffolk and west by Cambridgeshire and Lincolnshire. The area is 2,055 sq.mi., the county being the fourth in size in England.

Physical Features.—The county as a whole is low-lying, no point reaching up over 350 feet. In the extreme west we have the flat fens composed of recent alluvium, which is crossed by various dykes and ditches which help to drain the district; windmills used for this purpose are a conspicuous feature, though they are being replaced by pumping engines. To the east of the Ouse the land rises somewhat, where we have the north easterly extension of the chalk hills of England. These form the oldest rocks in the county, except for a few small patches of Kimeridge clay lying along their western side. The cretaceous rocks dip eastward under various glacial deposits such as boulder clay and gravel. The indeterminate nature of the drainage is due to glacial action. The heights also die away southward and eastward, and here the land is generally fertile and well wooded, with occasional expanses of heath. The rivers follow rather irregular courses, what

watershed there is lying across the centre of the county from south-east to north-west; the Cromer Morainic ridge forms a secondary parting at right-angles to the first. The largest rivers in the east of the county are the Yare and its tributaries the Bure and the Waveney, which forms a large part of the boundary with Suffolk. In the river valleys are large stretches of alluvial deposits.

Nearly two-thirds of the boundary of the county is formed by tidal water, but there are few bays or inlets. For the most part the coast-line is flat and low, and has been greatly encroached on by the sea, several villages having been engulfed since the Conquest. At certain points, however, blown sand is filling up some arms of the sea. From the mouth of the Yare to Happisburgh the shore is skirted by sandbanks. Thence for 20 m. it is formed of cliffs consisting of clay and masses of embedded rocks. These cliffs are succeeded by a low shingly or sandy coast stretching as far as St. Edmund's point. The shores of the Wash are formed of mudbanks, which are left dry at low water. At various points off the coast there are submarine forests, especially in Brancaster bay and in the neighbourhood of Cromer and Happisburgh.

Archaeology and History.—Palaeolithic implements have been found in the county in the valley of the Little Ouse and near Cromer. The county, because of the low rainfall and fairly strong winds, was never very heavily forested, and as such it offered a suitable home for Neolithic man, who has left extensive traces of his occupation on the chalk of the west and along the gravels in the east. A few miles north-east of Brandon there are extensive pits in the chalk dug by early man when quarrying for flint (Grimes' Graves), and in them were found numerous deer antlers used by him as picks. Bronze weapons are fairly numerous, and their distribution tallies generally with those of Neolithic artefacts. Evidence of probable contacts across the North sea is borne out by the fact that 11 beakers have been discovered in the county. Finds of the early Iron age are not numerous, but towards the end of the pre-Christian era and for some time after, Norfolk was part of the lands of the Iceni. This tribe accepted the suzerainty of the Romans at the Conquest, but at the death of their ruler, Prasutagus, and following the injustice of the Romans to his wife, Boudicca (Boadicea), and his daughters, they rebelled. Successful at first, they were finally completely defeated, and their territories ravaged by the victors. Of Roman remains in the county we have the settlement of Caister-by-Norwich, perhaps a small village at Caister-by-Yarmouth and a fort at Brancaster which guarded the Wash and the north coast, and which was the headquarters of the Count of the Saxon shore. A Roman road, known as the Peddar way, probably following a more ancient track, crosses the Little Ouse a few miles east of Thetford, and runs north-north-west across the country to near Hunstanton; another road from Colchester to Caister-by-Norwich enters the county by Scole. The eastward continuation of the pre-Roman Icknield way also crossed the county.

The district was invaded in the second half of the 5th century by Angle tribes from north Germany, who, having secured the coast districts, worked their way inland along the river valleys. East Anglia owned successively the supremacy of Kent, of Mercia and Northumbria, until in 827 the whole land was united under the rule of Egbert. In 867 the Danes under Inguar and Ubba defeated and killed King Edmund at Thetford, and Norfolk formed an integral part of the Danelaw. In the renewed Danish attacks of the 11th century Norwich and Thetford were destroyed. At the time of the Norman invasion Norfolk formed part of Harold's earldom.

Norfolk formed part of the diocese of East Anglia from its foundation in 630, and in 1075 the bishop's see was placed at Thetford, whence it was transferred to Norwich in 1093.

Architecture.—With a few exceptions, the majority of the churches are Decorated or Perpendicular, or a mixture of both styles. The churches of the marshes in the north-west are noteworthy, especially those of Tilney All Saints and Walpole St. Peter's, the finest Perpendicular edifice in Britain; the rich Norman church of Castle Rising should also be mentioned. At Northwold remains one of the rare Easter sepulchres. Apart from the churches in the towns, those of Worstead, Hingham, Cawston and Terrington St. Clement may be quoted as typical examples of the numerous fine later Gothic churches. Norfolk possessed an unusually large number of monastic foundations, but of these the remains are few and comparatively unimportant. The cathedral church of Norwich was originally connected with a very richly endowed Benedictine monastery. A foundation of almost equal importance was that of Augustinian canons at Walsingham, where there are remains of an Early English and Decorated church, a Decorated refectory and a Perpendicular gateway. The shrine of Our Lady of Walsingham was the resort of great numbers of pilgrims. Other monastic remains are Bromholm priory near North Walsham; slight Early English fragments of Beeston Augustinian priory, west of Cromer; good Norman and later remains at Binham (Benedictine) north-east of Walsingham; the Benedictine nunnery of Carrow near Norwich; the fine church (Norman and later) of the Benedictine priory at Wymondham; and the remains at Castle Acre and Thetford.

The shire-system was not definitely established in East Anglia before the Conquest, but the Domesday boundaries of Norfolk were practically those of the present day. The 36 Domesday hundreds were subdivided into leets, of which no trace remains, and the boroughs of Norwich and Thetford ranked as separate hundreds, while Yarmouth was the chief town of three hundreds. Norfolk and Suffolk were united under one sheriff until the reign of Elizabeth, the shire court for the former being held at Norwich.

In the war between John and his barons Roger Bigod garrisoned Norwich castle against the king. In the rising of 1381 Norwich was plundered by the insurgents, and in the rising of 1549 against enclosures Norwich was again captured by the rebels under Ket. In the Civil War of the 17th century Norfolk as a whole adhered to the parliamentary cause, forming one of the six counties of the Eastern Association. Lynn, however, was held for the king, and Norwich was one of the first cities to welcome back Charles II.

There are several old mansions of interest, such as the Jacobean brick building of Blickling hall, Barningham hall (1612), Hunstanton, the moated Oxburgh hall, and Cressingham manor, both of the 15th century. The larger mansions, however, such as Sandringham, are of modern date. Paston and Oxnead were successively the seats of the Paston family whose Letters are famous.

Politics and Agriculture.—Norfolk returned members to parliament in 1290, and in 1298 the county and the boroughs of Lynn, Norwich and Yarmouth returned each two members. Thetford acquired representation in 1529, and Castle Rising in 1558. Under the Reform Act of 1832 the county returned four members in two divisions, and Castle Rising was disfranchised. Under the act of 1868 the county returned six members in three divisions, and Thetford and Yarmouth were disfranchised.

At the time of the Domesday survey sheep-farming flourished almost throughout Norfolk, a flock of 1,300 being mentioned at Walton, and horses were extensively bred; numerous beehives, nearly 600 water-mills and valuable river fisheries are mentioned; and salt was made in the hundreds of Freebridge and East Flegg. There was also, after the Conquest, a well developed trade with Flanders in wool. The worsted trade was introduced by Flemish immigrants as early as the 12th century, and the woollen trade became especially prosperous in the hundreds adjoining the Wash. This immigration and those of religious refugees from the Continent in later times doubtless contributed to the county's having produced many notable men. Linen was manufactured at Aylsham in the 14th century. Fuller, writing in the 17th century, describes Norfolk as abounding in all good things, and especially rabbits, herrings and worsteds. The leather industry flourished in Norman times.

The great variety of the soils has helped to make Norfolk rich agriculturally, and where the land is not suitable for plowing it is usually good for pasture. It was at Holkham, in this county, that Thomas Coke, earl of Leicester, carried out experiments in the cultivation of wheat and began to improve the standard of livestock in Britain. In 1939 the total acreage under crops and grass was 974,246, of which 119,387 ac. were under wheat, 184,719 ac. under barley, while oats occupied less than half the acreage of wheat. Rye covered 1,978, beans and peas 11,338 acres.

The area of sugar beets was 89,391 ac., of potatoes 24,098 ac., and of turnips and swedes 21,698 ac. Clover and rotation grasses for hay occupied 82,633 ac., and orchards 9,664 ac. A feature in the cultivation of Norfolk has been the extensive planting of trees. The National Trust owned 6,538 ac. in 1942.

Industries, Communications, etc.—The weaving of silk and wool is still carried on at Norwich and also shawl weaving, although the staple trade of the town is now boots and shoes. Silk is also manufactured at Yarmouth, Wymondham and North Walsham. Flour-mills are numerous all over the county, and there are agricultural implement works at Norwich, Lynn, Thetford, East Harling, North Walsham, Walsingham and East Dereham. Lime-burning, brick-making, tanning, malting and brewing are carried on in various districts. There are extensive mustard and starch works at Norwich. The sea-coast is of a dangerous nature and there is a lack of harbours. A large trade, however, is carried on at Yarmouth, which is also famous for its herring fishery. The other principal port is Lynn, and there is a small trade at Wells.

The L.N.E. and the M. and Gt.N.Jt. railways serve the principal towns. The eastern rivers afford water communication with Great Yarmouth, while the Great and Little Ouse and some of the drainage cuts communicate with Lynn.

The area of the administrative county is 2,036 sq.mi., with a population (1938) of 501,660, though between Sept. 1939 and Feb. 1941 the population decreased 2% as a result of wartime evacuation. The municipal boroughs are—King's Lynn; Norwich, a city and county borough and the county town; Thetford; and Yarmouth, properly Great Yarmouth, a county borough. The county is in the south-eastern circuit, and assizes are held at Norwich. There are two courts of quarter sessions. Each of the four municipal boroughs has a separate court of quarter sessions. Norfolk is in the diocese of Norwich except for three rural deaneries in west Norfolk, which are in that of Ely. There are five parliamentary divisions—King's Lynn, South-Western, Northern, Eastern and Southern—as well as the parliamentary borough of Norwich (two members), and part of the parliamentary borough of Great Yarmouth (one member). Of the three boys' public schools in the county, two are in Norwich, viz., King Edward VI's school and the City of Norwich school. The third, Gresham's school, was founded at Holt, near Sheringham, in 1555, by Sir Thomas Gresham (*q.v.*).

Broads and Rivers.—The rivers and broads (lakes) of Norfolk, together with the few in Suffolk, form over 200 m. of navigable waterway. They are now, however, chiefly used by pleasure craft, though a diminishing number of trading wherries still carry coal and other goods between the large towns, such as Yarmouth, and the villages. The southern rivers are wider and deeper than the northern, and the Yare can be navigated by sea-going trading vessels as far as Norwich.

The formation of a broad may be due either to the widening of a river or to a sea-estuary becoming completely enclosed by sand-banks. The broads tend to become overgrown with reeds which, if they are not cut (they can be utilized to make a very durable thatch), rot and fall to the ground, and, aided by the general silting up, they may cause the broad to be replaced by dry land. Several of the broads have to be dredged to preserve a navigable channel, some of them (*e.g.*, Hickling broad) being extremely shallow.

Some of the broads are extremely beautiful; notably Wroxham, Salhouse and South Walsham (up the Bure), which are surrounded by wooded country; Barton broad (up the Ant); and Horsea mere (up the Thurne, not far from the sand dunes and near to Hickling broad), which is of quite a different character, being surrounded by reedy marshland, the haunt of hundreds of different species of wild birds. The bittern (*q.v.*) was saved from extinction at an island on Hickling broad, and now flourishes in considerable numbers. The bearded tit (*see* TITMOUSE) has also been saved from the same fate. The fishing is good, and wild duck are shot from a "Breydon duck-punt" which carries a heavy gun aimed by manoeuvring the boat itself.

Emerson, *Pictures of East Anglian Life* (1888); Rev. A. Jessopp, *Arcady* (1887), and other works by both; *Quarterly Review* (1897), where other literature is cited; G. C. Davies, *Norfolk Broads and Rivers* (Edinburgh, 1884); Christopher Marlowe, *People and Places in Marshland* (1927); "Land of Britain," *Land Utilisation Survey*, Part 70 (London, 1938).

NORFOLK, a city of Madison county, Neb., U.S., in the northeastern part of the state, on the Elkhorn river, at an altitude of 1,525 ft. It is on federal highways 81 and 275 and is served by the Chicago and North Western, the Chicago, St. Paul, Minneapolis and Omaha and the Union Pacific railways. Pop. (1950) 11,231; (1940) 10,490 by federal census. Food processing is its major industry. The city was founded in 1866, incorporated in 1881 and chartered in 1886.

NORFOLK, a seaport of Virginia, U.S., on the Hampton Roads. It is on federal highways 58, 60 and 460 and is served by the Atlantic Coast Line, the Chesapeake and Ohio, the Norfolk Southern, the Norfolk and Western, the Pennsylvania, the Seaboard Air Line, the Southern and the Virginian railways (all interconnected by an industrial belt line), and by interurban trolleys, motorbus and air lines, several ferries and about 60 steamship lines. Pop. 188,601 in 1950; it was 144,332 in 1940 and 129,710 in 1930 by federal census.

The city has 50 mi. of water front on Hampton Roads, Chesapeake bay, the Elizabeth river (which is a tidal estuary, not a river), and the Lafayette river (another estuary). Immediately opposite is the city of Portsmouth. The town of Berkley was annexed to Norfolk in 1906, and lying beyond it is the still independent town of South Norfolk.

The waters about Norfolk, Portsmouth and Newport News (officially known as the Port of Hampton Roads, and under the jurisdiction of the state port authority created in 1926) form one of the finest natural harbours of the world, where a thousand ships at a time have found berthing space or anchorage without taxing its capacity. The part known as Norfolk harbour (which includes the Portsmouth waters) is 15.5 mi. long, varies from ½ to 2 mi. in width and is connected with the bay by a 40-ft. channel. On the Norfolk water front there are 154 piers, largely owned by railroads, steamship lines and shipbuilding companies. The army supply base, north of the Lafayette river, established in 1917 and representing an investment of $30,000,000, was leased by the city from the United States in 1919, and beyond it a modern municipal terminal was constructed (at an expenditure of $6,000,000) including a grain elevator with a capacity of 800,000 bushels, a dock specially equipped for shipping garden and farm produce and a general merchandise pier 1,210 ft. long, with transit sheds and warehouses. The business section of the city is compactly built up with hotels, stores and office buildings that seem tall in proportion to the width of the streets.

Some beautiful antebellum homes and interesting old buildings remain, including St. Paul's church (1739), which has a British cannon ball embedded in its walls; the old Norfolk academy (built in 1840), now used temporarily by the juvenile and domestic relations court; and the colonnaded city hall (1850). There are public parks covering 500 ac., 30 playgrounds, 41 public-school buildings, 225 churches, two daily newspapers, a public library with seven branches, a municipal market built in 1923 at a cost of $500,000 and a picturesque municipal armoury.

Virginia beach, a popular resort on the Atlantic, 5 mi. below Cape Henry, is 20 mi. east of Norfolk, and there are many other recreation spots in the vicinity.

The water supply, sufficient for a much larger city, comes partly from works built in 1872–73, which for some time had been seriously inadequate, and partly from Lake Prince (20 mi. W.) through a new system constructed after 1920 at a cost of $6,000,000.

In 1919 the city adopted a council-manager form of government.

Norfolk is the centre of many activities of the federal government. The Norfolk navy yard is on the Portsmouth side of the Elizabeth river (*see* PORTSMOUTH), and the naval hospital is also in Portsmouth. In Norfolk (directly opposite the navy yard) is the St. Helena naval reservation, used as a naval air-landing

field. Within the city are also a U.S. public health service hospital, a branch of the U.S. hydrographic office, district headquarters of the coast guard, headquarters of the customs district of Virginia and various other offices. At Sewall point, on the northern edge of Norfolk, is the Hampton Roads naval operating base, where thousands of men were trained for the navy during World Wars I and II; a supply station with warehouse floor space of 55 ac. and the navy's principal fuel reserve depot; a naval air station and a submarine base.

Hampton Roads has become one of the important ports of the United States in respect to foreign trade, handling normally about 2% of the total of U.S. exports and imports. About 70% of the tobacco exported from the United States moves through Hampton Roads, and it is an important coal depot for coastwise and foreign trade and for bunkering purposes. It is also an important oil-bunkering port, with a storage capacity of 2,500,000 bbl. About two-thirds of the total tonnage of Hampton Roads moves through the Norfolk harbour.

Norfolk is surrounded by one of the finest truck-farming districts of the United States, and is the shipping point for immense quantities of potatoes, spinach, kale, beans, cauliflower, tomatoes and strawberries. Shipbuilding is perhaps the most important of Norfolk's industries. Among other products are fertilizers (1,000,000 tons a year), peanut and cottonseed oil, sea foods, textiles, automobiles, cement and lumber.

Norfolk was laid out in 1682 (on 50 ac. of land bought from Nicholas Wise, a carpenter, for 10,000 lb. of tobacco) to be a centre of trade, and was incorporated as a borough in 1736. On Jan. 1, 1776, it was furiously bombarded by the British under Lord Dunmore. Sailors set fire to the warehouses along the water front, and the town burned for three days, until all the buildings except St. Paul's church were destroyed. After the Revolution it was rebuilt, and grew rapidly until the Embargo act of 1807 ruined its commerce at a single stroke. In the War of 1812 Norfolk was attacked and successfully defended. It was chartered as a city in 1845.

In 1855 there was a disastrous epidemic of yellow fever, brought in by a man-of-war. At the outbreak of the Civil War Norfolk had a population of 14,620. The navy yard was burned and abandoned by the Federals in April 1861, and the city was held by the Confederates until May 10, 1862. Recovery after the war was gradual until 1880, when the population was 21,966. After that growth was more rapid, to 34,871 in 1890, 46,624 in 1900, and 67,452 in 1910. The Ter-Centennial exposition, celebrating the founding of Jamestown, was held here in 1907, on ground now within the city limits and occupied by the naval base.

During World Wars I and II Norfolk experienced accelerated prosperity, at first caused by heavy shipments of orders to the Allies, and in the later phases of both wars by the activities at the army supply base and the naval operating base and navy yard. Correspondingly severe was the postwar deflation following World War I, when the army base was closed down, the fleet transferred to the Pacific coast and the naval training station reduced to a skeleton organization; but in the following years substantial foundations were laid for a healthy commercial, civic and industrial development.

NORFOLK AND WESTERN RAILWAY COMPANY, THE, one of the world's greatest coal carriers, with total assets of $564,039,308.91 and a total capitalization of $163,482,800 on Dec. 31, 1939, employed 20,000 persons and operated 4,628.01 m. of track in six States in the United States, namely: Virginia, West Virginia, North Carolina, Maryland, Ohio and Kentucky. Its main line runs from Norfolk and Lambert Point, Va., the eastern terminus, on the Port of Hampton Roads, through agricultural, livestock and mineral sections of Virginia, through vast coal fields in West Virginia and thence into Ohio to Cincinnati and Columbus, the western terminals. A line from Roanoke, Va., to Hagerstown, Md., makes connections for the east and north; two lines into North Carolina, one from Roanoke, Va., to Winston-Salem and the other from Lynchburg, Va., to Durham, make connections with the south. One of the first railroads in the country to employ electric traction, the N. and W. greatly increased its operating efficiency by electrifying 210 m. of track on mountain grades in West Virginia. The coal traffic of the road has grown from 70,000 tons in 1883 to about 40,000,000 tons annually.

The road had its beginning in Virginia in 1838 as the City Point Railroad running between Petersburg and City Point, a distance of nine miles. The South Side (which purchased the City Point), Norfolk and Petersburg, and Virginia and Tennessee railroads, all in Virginia, and built between 1849 and 1858, running from Norfolk to the Tennessee line at Bristol, consolidated in 1870 as the Atlantic, Mississippi and Ohio R.R. Co., with a total trackage of 479 miles. This road was sold in 1881 and became the Norfolk and Western Railroad Company. Between 1881–91 it built three lines into the coal fields of Virginia and West Virginia extending beyond to Ohio and acquired by purchase two other roads, one running from near Ironton, Ohio to Columbus, and the other, from Roanoke to Hagerstown. In Sept. 1896, the railroad was reorganized as the Norfolk and Western Railway Co. Later in the year it purchased the two lines running from Virginia into North Carolina. In 1901 it bought a second line in Ohio, from Sciotoville to Cincinnati. Since that time the road has had a steady development, with double tracking, branch construction and the complete modernization of all its facilities. (W. J. J.)

NORFOLK ISLAND: *see* Pacific Islands.

NORICUM, a district south of the Danube, corresponding to part of Styria and Carinthia, Austria, Bavaria and Salzburg. The population was Illyrian afterwards subordinate to various Celtic tribes. The country is mountainous and the soil poor, but it was rich in iron, and the famous Noric steel was used for Roman weapons. The inhabitants were warlike and paid more attention to cattle-breeding than to agriculture. Gold and salt were found in considerable quantities; the wild nard grew in abundance, and was used as a perfume. Noricum was the southern outpost of the Celtic peoples and the starting-point of their attacks upon Italy. The cemeteries of Hallstatt (*q.v.*), less than 40m. from Noreia, contained weapons and ornaments from the bronze age up to the fully developed iron age. Prof. Ridgeway (*Early Age of Greece*, i. ch. v.), holds that here was the cradle of the Homeric Achaeans. For a long time the Noricans enjoyed independence under princes of their own, and carried on commerce with the Romans. In 16, having joined with the Pannonians in invading Histria, they were defeated by Publius Silius, proconsul of Illyricum. From this time Noricum was called a province, although not organized as such, but remaining a kingdom with the title *regnum Noricum*, under the control of an imperial procurator. In the reign of Marcus Antoninus the Legio II. Pia was stationed at Noricum, and the commander of the legion became governor.

NORMAN, SIR HENRY WYLIE (1826–1904), field-marshal and colonial governor, was born on Dec. 2, 1826, and entered the Indian army at the age of seventeen. Norman served in numerous frontier campaigns between 1850 and 1854, and in the suppression of the Sonthal rebellion of 1855–56. In the Mutiny campaign he was constantly engaged, being present at the siege of Delhi, the relief of Lucknow and a number of other affairs. As adjutant-general of the Delhi Field Force, he was one of the leading spirits of the siege, and afterwards became its chief chronicler. Altogether he was mentioned twenty-five times in despatches. He held various important positions at Simla and at Whitehall until 1883. He was then governor of Jamaica (1883–88), governor of Queensland (1888–95), agent-general for Queensland, and in 1901 governor of the Royal Hospital, Chelsea. In 1902 he was made a field-marshal. He died on Oct. 26, 1904.

See Sir William Lee Warner, *Memoirs of Field-marshal Sir Henry Wylie Norman* (1908).

NORMAN, MONTAGU COLLET (1871–1950), British financier, was educated at Eton and King's college, Cambridge, and served in the South African War, 1900–01. He afterward be-

came connected with finance and his active association with the Bank of England began during World War I. In 1918 he was appointed deputy governor and in 1920 governor of the Bank of England. By 1926, when he was re-elected for the seventh time, he had held the post longer than any previous governor. He finally retired in April 1944 because of failing health and was succeeded as governor by Lord Catto. During his governorship the gold standard was restored (1925) and again abandoned (1931). In 1923 he was made a privy councillor and in 1933 he married Priscilla Worsthorae, granddaughter of the 7th Earl of Abingdon. He was created a baron in July 1944 and took the title Baron Norman St. Clere in the county of Kent. He died Feb. 4, 1950.

NORMAN, a city of central Oklahoma, U.S., 18 mi. S. of Oklahoma City, on a plateau 1,170 ft. above sea level, overlooking the valley of the South Canadian river; county seat of Cleveland county. It is on federal highway 77, and is served by the Santa Fe railway. The population was 27,006 in 1950 and 11,429 in 1940 by the federal census.

Norman was founded in 1889, when settlement in the Oklahoma territory began, and it was chartered as a city in 1902. Under the council-manager form of government adopted in 1919, the council members, who are directly elected for terms of two years, select the mayor. He can vote on all issues and also has full veto power. The city owns and operates a sewage treatment plant and a waterworks.

Hospitals in Norman are the Central State hospital for mental illness, established in 1895, the Ellison infirmary, on the University of Oklahoma campus, 1928, and the Norman Municipal hospital, 1946. There is the Norman Public library, which in 1950 had more than 18,000 volumes.

In 1892 the University of Oklahoma was opened in Norman after the people of the town and of Cleveland county, as required by the act of 1890 of the first legislature of the territory of Oklahoma, had provided 40 ac. for the university site and $10,000 for a building. In the first year, David Ross Boyd, the president, and three teachers began classes in a rented store, but by 1893 the first building was completed. A preparatory school, which was discontinued in 1911, was also established. By the 1950s the university had grown to include 11 schools and colleges with 12,000 students and a faculty of more than 800; the university library had more than 300,000 volumes.

Norman is primarily an agricultural community, and there are milk processing plants, cottonseed oil mills and cotton ginning plants. Other industries include mattress, broom and furniture factories and light manufacturing.

NORMAN, in architecture, the Romanesque style developed in Normandy and England during the 11th and 12th centuries, up to the time of the general adoption of Gothic architecture in both countries. Since it was only shortly before the Norman conquest of England that Normandy became settled and civilized enough to produce an architecture, the origin in both countries is the same, and early types extremely similar. This common early Norman differed from Romanesque in its love of geometric ornament such as zigzags, general crudeness in the scant figure and leaf carving, and a daring originality in construction ideas, possibly owing much to the fact that Lanfranc of Pavia (d. 1089) had introduced Lombard ideas into many Norman abbeys.

Although the English and French phases of the style were thus identical at the start, they soon became different. The French was characterized by careful, structural articulation (Abbaye-aux-Dames and Abbaye-aux-Hommes, Caen, both founded in 1062, but altered later), and elaboration of tower and spire (S. Michel de Vaucelles, Caen, 12th century). In England the chief characteristics are enormous length of church plan, the frequent use of great round columns for the nave arcade (Gloucester cathedral, 1089–1100; Tewkesbury abbey, 1123; and Durham cathedral, alternate piers, 1099–1128) and great decorative richness (Prior's door, Ely cathedral, late 12th century; S. Mary's chapel, Glastonbury abbey, 1186; the front of Iffley church, 12th century; and the Galilee porch at Durham, *c.* 1175). The general Norman structural genius is most markedly shown in the buttressing system and in the ribbed vault of Durham cathedral, whose date is much debated, being placed as early as 1133 and as late as the 13th century. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE.)

NORMANBY, CONSTANTINE HENRY PHIPPS, 1ST MARQUESS OF (1797–1863), British statesman and author, son of Henry, 1st earl of Mulgrave (1755–1831), was born on May 15, 1797. The 1st earl (who was created baron in 1794 and earl in 1812) was a distinguished soldier, and William Pitt's chief military adviser; and he held the offices of chancellor of the duchy of Lancaster (1804), secretary for foreign affairs (1805), first lord of the admiralty (1807–10) and master of the ordnance (1810–18). In 1792 he inherited the earlier Irish barony of Mulgrave—created in 1767 for his father, Constantine (1722–75), grandson of Sir Constantine Phipps (1656–1723), the lord chancellor of Ireland—from his elder brother, Constantine (1744–92), a naval captain.

His son, the 1st marquess, was governor of Jamaica (1830–35) and lord-lieutenant of Ireland (1835–39). He was created marquess of Normanby in 1838, and held successively the offices of colonial secretary and home secretary in the last years of Lord Melbourne's ministry. From 1846 to 1852 he was ambassador at Paris, and from 1854 to 1858 minister at Florence. The publication in 1857 of a journal kept in Paris during the stormy times of 1848 (*A Year of Revolution*), brought him into violent controversy with Louis Blanc, and he came into conflict with Viscount Palmerston and William Gladstone, on French and Italian policy. He died on July 28, 1863. He was succeeded as 2nd marquess by his son George (1819–90), a liberal statesman, who became governor of Queensland (1871–74), New Zealand (1874–79) and Victoria (1879–84).

NORMANDY, an ancient province of France, bounded on the northeast by the river Bresle, which falls into the English channel at Le Tréport and separates Normandy from Picardy, and then roughly by the Epte, which divides the Vexin into two parts. In 1791 the old duchy was divided approximately among the modern departments of Seine Inférieure, Eure, Orne, Calvados and Manche. Geographically, Normandy is characterized by its bordering on the sea, which encourages maritime life and explains the dampness of the climate; by the predominance of agriculture and stock raising; and, finally, by the importance of the Seine valley, which determined the situation of the capital city, Rouen, and attracted industry and trade, taking advantage of the neighbourhood of Paris.

History.—Till the 10th century A.D. Normandy retained certain Gallo-Roman features. The Germanic invasions and the conquest by Clovis before 506 little modified the features of the part of the old province of Lugdunensis Secunda, henceforth named Neustria; *civitas* and *pagi* subsisted. Christianity, introduced in the 4th century by St. Mello and St. Victricius, was extended under the protection of the Merovingians, benefactors of the abbeys of Fontenelle (modern Saint-Wandrille), Jumièges and Mont-Saint-Michel. The Norman settlement was established by the treaty of Saint-Clair-sur-Epte, concluded in 911 between King Charles the Simple of France and Rollo, chief of the Normans. The latter received territory comprising the town of Rouen and a few *pagi* situated on the coast; but afterward Rollo also received Bessin and Maine. This settlement put an end to plundering by the Normans, who, moreover, seem to have left intact much that they found. Rollo had been baptized; he and his successors maintained the great abbeys and kept the domanial system of farming almost unchanged. But since even today many proper names and place names of Scandinavian origin are found there, the newcomers must have been fairly numerous. Without losing the spirit of adventure which carried them in the 11th century to the conquest of England and southern Italy (on the pilgrims' road to Jerusalem), the Normans soon acquired the standards of the older population of France. They played their part in the troubles of the last Carolingian reigns and the feudal conflicts. Contact, if not rivalry, developed between the Norman duchy and the neighbouring county of Flanders, the counties of Maine and Anjou, the duchy of Brittany, the Capetian duchy (soon afterward kingdom) of France and, finally, England.

The first two dukes of Normandy, Rollo and his son William I

"Longsword", displayed a certain fidelity to the Carolingian dynasty, and in 936 William did homage to Louis IV d'Outremer of France. However, during the minority of William's successor, Richard I, Louis IV attempted to reconquer Normandy; but Richard was helped by King Harold of Denmark, and Louis was captured by the inhabitants of Rouen and handed over to Hugh the Great. William Longsword had been assassinated in 942 by Arnulf (Arnoul), count of Flanders, who was an ally of Louis IV; and Normans, Flemings and Robertian Frenchmen were rivals for the possession of Ponthieu.

The need for defense against common enemies brought together the Norman dukes and the Robertians and their heirs. In 958 Duke Richard I married Hugh the Great's daughter; and Richard's help facilitated the accession of his brother-in-law Hugh Capet to the French throne. Richard II (996–1026) had no need of external assistance to crush the peasant insurrection, of which William of Jumièges has given so horrifying an account; but his son Robert the Devil (1027–35), was clever enough to support Henry I of France against his brother Robert, who was laying claim to the throne; and in return for this service he received the Vexin-Français (1131). In turn, Henry I supported the young duke William II the Bastard (later William I the Conqueror of England), son of Robert the Devil and Arlette (daughter of a tanner of Falaise), and helped him defeat the rebellious Norman nobles at Val-aux-Dunes (1047). William in his turn supported the king against Geoffrey Martel, count of Anjou. There the exchange of good offices stopped.

A second phase of Norman history began with William's successes abroad. Normandy appeared as a dangerous rival of the Capetian monarchy. Henry I reconquered the Vexin-Français, supported Geoffrey Martel against William and encouraged the count of Eu and Montreuil in his claims to the duchy, but almost to no purpose. William conquered Maine, attacked Brittany and married Matilda, daughter of Baldwin V, count of Flanders; and the conquest of England doubled his power (1066). Normandy, however, was first administered by Matilda and then devolved not to William Rufus but to the Conqueror's eldest son, Robert Curthose, from whom his brother Henry Beauclerk (Henry I of England) finally wrested it, annexing it to England only in 1106.

Yet the duchy remained the geographic centre of the Anglo-Norman state, and its prospects were intimately linked with the feudal complications of the continent. Protected by the king of France, the son of Robert Curthose, William Clito, laid claim to Normandy, but defeat at Brémule (1119) destroyed his hopes. After the death of Henry I (1135) Normandy was once more disputed by his single heir Matilda (widow of the emperor Henry V and wife, by her second marriage, of Geoffrey Plantagenet, eldest son of Fulk V, count of Anjou); by Theobald II, count of Champagne, grandson of William the Conqueror, candidate of the Normans of Normandy; and on the other side by Stephen, count of Blois and Theobald's brother, whom the Normans of England supported. Geoffrey, with French and Flemish help, gradually subdued Normandy. In 1144 Theobald, whose position had been much weakened by loss of the castle of Rouen, gave up his rights to Henry Plantagenet, son and successor of Geoffrey. Bounded to Maine and Anjou, Normandy was, more than England and Aquitaine (brought in dowry), the main piece of the Angevin empire. Its wealth and the perfection of its administration by viscounts and then by *baillis* brought the prince both money and soldiers. The French kings, now fully conscious of the Angevin menace, struggled against it. The reign of Louis VII was occupied by the struggle against Henry II; and Philip Augustus pursued the same policy with tenacity and at last with success. Richard Coeur-de-Lion, however, was victorious at Fréteval and at Courcelles near Gisors and built Château-Gaillard to bar access into Normandy. On Richard's death at Châlus in 1199, Philip was in a position and was lucky enough to make peace by the treaty of Goulet (1200). But when the feudal condemnation of John Lackland, Richard's brother and successor, allowed Philip to confiscate his vassal's property, he invaded Normandy in June 1202 and besieged the castle of Arques, near Dieppe. Château-Gaillard was occupied after eight months' siege (Sept. 1203–April 1204), and the rest of Normandy was taken in the following months, Rouen surrendering in 1204 but obtaining a guarantee of the privileges allowed by Henry II (*Établissements de Rouen*). The French conquest of Normandy was not, however, recognized officially by the kings of England till the treaty of Paris (1259). The Capetians even modelled the institutions of their other estates after those of Normandy, which became prosperous. In 1329 the duchy was revived in favour of John, son and future successor of Philip VI. In his turn, John the Good gave Normandy as an appanage to the dauphin Charles (1350).

The Hundred Years' War opened a tragic and decisive period for Normandy. Its geographical position made the province a field of battle; the claims of the English kings to the French crown gave them a pretext for uniting the duchy with England. In 1346 Edward III invaded Normandy. Landing at Saint-Vaast-la-Hougue (July 12) and arriving at Caen on July 25, he laid waste to the country as far as Poissy. The treaty of London (1359) stipulated the cession of Normandy to England, but its provisions were modified by that of Brétigny (1360), and Normandy remained in the possession of France.

The most striking event of the war in Normandy during the reign of Charles V (1364–80) was the siege of Saint-Sauveur-le-Vicomte, which was occupied by the English and surrendered only after a siege of several years. At the death of Charles V, the English possessed only Cherbourg, which they evacuated in the last years of the 14th century. Still the war and taxes (*aides*) had so much overburdened the country that a revolt, the "Harelle," broke out in 1381 at Rouen, in punishment for which the town lost its privileges.

In 1415 the war with England was resumed. An English army of 60,000 men landed on Aug. 14 at the mouth of the Seine, took Harfleur on Sept. 16 and finally defeated the French king's army at Agincourt. During the following years the whole of Normandy was occupied, though Rouen held out for nearly six months (July 29, 1418–Jan. 13, 1419). Henry V of England entrusted the administration of Normandy to a special council. Under the government of the duke of Bedford, brother of Henry V and regent for the young Henry VI, Normandy profited from a policy of relative conciliation. But after the campaigns of Joan of Arc and her death at Rouen (May 30, 1431) there was an outbreak of patriotic feeling, which had been smouldering chiefly in the country districts. After the death of Bedford and the treaty of Arras, which deprived England of the Burgundian alliance, the position of the English in Normandy became insecure. The whole district of Caux revolted at the end of 1435, as did that of the Val-de-Vire in 1436. Mont-Saint-Michel had never been taken by the English, who built Granville to control it. But Normandy was not recovered by the French till after the sack of Fougères (1449). Cotentin was reconquered by the earl of Richmond, Arthur III (*q.v.*) of Brittany. Rouen surrendered on Oct. 29, 1449. An English army under Thomas Kyriel landed at Cherbourg and marched across Cotentin to Bayeux, but was met at Formigny (April 15, 1450) by the count of Clermont and routed. Caen and finally Cherbourg capitulated.

After the reconquest by the king of France, the history of Normandy is less eventful, but the province contributed its peculiar share to the life of France. Charles VII respected the local institutions—the provincial estates; the exchequer, which he transformed into a permanent court of justice (the *parlement* of Rouen); and the University of Caen (founded by the kings of England). The restored peace was to be troubled only in the 16th century during the wars of religion. The Reformation had most effect at the University of Caen, at Alençon and in the Pays-de-Caux. The Huguenots were helped by Queen Elizabeth, but the Catholic league established itself in Normandy, and Henry IV had to conquer it by force of arms, winning the victories of Arques and Ivry (though Rouen, defended by Alexander Farnese, duke of Parma, was surrendered only after Henry had abjured the Reformed religion). The weight of taxation gave rise in 1639 to the peasant insurrection of the *Va-nu-pieds*, but the Normans took little share in the Fronde, being temperamentally inclined to moderate courses.

The Normans combine the spirit of enterprise with prudence.

From the early 16th century their voyages to Newfoundland, Brazil and the Indies, on the initiative of Jean Ango of Dieppe and of the Florentine explorers Giovanni and Girolamo Verrazano, in the service of Francis I, enriched Rouen and the new port of Le Havre, founded in 1517. Jean Colbert recruited many Norman settlers for New France; and it was an inhabitant of Rouen, René Robert Cavelier, sieur de la Salle, who explored the valley of the Mississippi and founded Louisiana. In the 18th century Rouen inaugurated, with John Holker, the cotton manufactures which in the 19th century were to supersede the woollen. But the basic wealth of the province remains in agriculture and stock raising.

The architecture of Normandy is magnificent. Examples are the churches of flamboyant style, castles and also the urban residences of the merchants. Pierre Corneille may be regarded as typifying the balanced mind of the Normans; the economist Pierre le Pesant, sieur de Boisguilbert, their practical common sense.

Hostile to the dictatorship of men or parties, the Normans were for federalism against the Montagnards in 1793; Charlotte Corday, who killed Marat, was a native of Caen. Among the Norman middle class Louis-Philippe found his most faithful supporters and protectionism its most resolute partisans. In the politics of the third republic the bulk of the Norman population inclined to the moderate parties of the centre.

Spared in World War I, when it sheltered the exiled Belgian government, Normandy was devastated during World War II in June 1940 and more disastrously from June to August 1944, after the Allied landing (June 6) on the beaches of Calvados. Reconstruction began with the cessation of the fighting.

NORMANS, the softened form of the word "Northman," applied first to the people of Scandinavia in general, and afterward specially to the people of Norway. In the form of "Norman" it is the name of those colonists from Scandinavia who settled in Gaul, founded Normandy, adopted the French tongue and French manners, and from their new home set forth on new errands of conquest, chiefly in the British islands and in southern Italy and Sicily. Normans and Northmen must be carefully distinguished. For these Normans began to adopt a new religion, a new language, a new system of law and society, new thoughts and feelings on all matters. To all outward appearance the Norman conquest of England was an event of an altogether different character from the Danish conquest. The one was a conquest by a people whose tongue and institutions were still palpably akin to those of the English. The other was a conquest by a people whose tongue and institutions were palpably different from those of the English. The Norman settlers in England felt no community with the earlier Danish settlers in England. In fact the Normans met with the steadiest resistance in a part of England which was largely Danish. But the effect of real, though unacknowledged, kindred had none the less an important practical effect. There can be no doubt that this hidden working of kindred between conquerors and conquered in England, as compared with the utter lack of all fellowship between conquerors and conquered in Sicily, was one cause which made so wide a difference between the Norman conquests of England and of Sicily.

Character of the Normans.—The English and the Sicilian settlements form the main Norman history of the 11th century. The new creed, the new speech, the new social system, had taken such deep root that the descendants of the Scandinavian settlers were better fitted to be the armed missionaries of all these things than the neighbours from whom they had borrowed their new possessions. With the zeal of new converts they set forth very much in the spirit of their heathen forefathers. The same spirit of enterprise which brought the Northmen into Gaul seems to carry the Normans out of Gaul into every corner of the world. Their character is well painted by a contemporary historian of their exploits, Geoffrey Malaterra. He sets the Normans before us as a race specially marked by cunning, despising their own inheritance in the hope of winning a greater, eager after both gain and dominion, given to imitation of all kinds, holding a certain mean between lavishness and greediness—*i.e.*, perhaps uniting, as they certainly did, these two seemingly opposite qualities. Their chief men, he adds, were specially lavish through their desire of good report. They were, moreover, a race skilful in flattery, given to the study of eloquence, so that the very boys were orators, a race altogether unbridled unless held firmly down by the yoke of justice. They were enduring of toil, hunger, and cold whenever fortune laid it on them, given to hunting and hawking, delighting in the pleasure of horses, and of all the weapons and garb of war. Love of imitation is marked. Little of original invention can be traced to any strictly Norman source; but no people were ever more eager to adopt from other nations, to take into their service and friendship from any quarter men of learning and skill and eminence of every kind. To this admirable quality is perhaps to be attributed the fact that a people who accomplished so much, who settled and conquered in so large a part of Europe, has practically vanished from the face of the earth.

Their Faculty of Adaptation.—But Geoffrey hardly did justice to the Normans if he meant to imply that they were simple imitators of others. Their position was very like that of the Saracens. In no department of science or art did any Saracen, strictly speaking, invent anything; but they learned much both from Constantinople and from Persia, and what they learned they largely developed and improved. The Normans did just the same. They adopted the French tongue, and were presently among the first to practise and spread abroad its literature. They adopted the growing feudal doctrines of France, and worked them, both in Normandy and in England, into a harmonious system. From northern Italy, as it would seem, they adopted a style of architecture which grew in their hands, both in Normandy and in England, into a marked and living form of art. Settled in Gaul, the Scandinavian from a seafaring man became a landsman. Even in land-warfare he cast aside the weapons of his forefathers; but he soon learned to handle the weapons of his new land with greater prowess than they had ever been handled before. He welcomed the lore of every stranger. Lanfranc brought law and discipline; Anselm brought theology and philosophy. The gifts of each were adopted and bore fruit on both sides of the Channel. And no people ever better knew how to be all things to all men. The Norman power in England was founded on full and speedy union with the one nation among whom they found themselves. The Norman power in Sicily was founded on a strong distinction between the ruling people and the many nations which they kept in peace and prosperity by not throwing in their lot with any one among them.

The quality which Geoffrey Malaterra expresses by the word "effrenatissima" is also clearly marked in Norman history. It is, in fact, the groundwork of the historic Norman character. It takes in one case the form of ceaseless enterprise, in another the form of that lawlessness which ever broke out, both in Normandy and in every other country settled by Normans, when the hand of a strong ruler was wanting. But it was balanced by another quality which Geoffrey does not speak of, one which is not really inconsistent with the other, one which is very prominent in the Norman character, and which is, no less than the other, a direct heritage from their Scandinavian forefathers. This is the excessive litigiousness, the fondness for law, legal forms, legal processes, which has ever been characteristic of the people. If the Norman was a born soldier, he was also a born lawyer. But nothing so well illustrates this formal side of the Norman character as the whole position of William the Conqueror himself. His claim to the crown of England is something without earlier precedent, something as far as possible removed from the open violence of aggressors who have no pretexts with which to disguise their aggression. It rested on a mass of legal assumptions and subtleties, fallacious indeed, but ingenious, and, as the result proved,

effective. His whole system of government, his confiscations, his grants, all that he did, was a logical deduction from one or two legal principles, arbitrary certainly in their conception, but strictly carried out to their results. Even Norman lawlessness in some sort took a legal shape. In the worst days of anarchy, in the minority of William or under the no-reign of Robert, the robber-baron could commonly give elaborate reasons for every act of wrong that he did.

The Normans were, therefore, crusaders before crusades were preached. Norman warriors had long before helped the Christians of Spain in their warfare with the Saracens of the Peninsula, and in Sicily it was from the same enemy that they won the great Mediterranean island. Others had done a kindred work in a more distant field as helpers of the Eastern emperors against the Turks of Asia. All these might pass for religious wars, and they might really be so; it needed greater ingenuity to set forth the invasion of England as a missionary enterprise designed for the spiritual good of the benighted islanders. The Norman, a strict observer of forms in all matters, attended to the forms of religion with special care. No people were more bountiful to ecclesiastical bodies on both sides of the Channel; the foundation of a Benedictine monastery in the 11th century, of a Cistercian monastery in the 12th seemed almost a matter of course on the part of a Norman baron. On the other hand, none were less inclined to submit to encroachments on the part of the ecclesiastical power, the Conquerer himself least of all.

Neither England nor Sicily has become a Norman land, and the tongue which the Norman brought with him into both has not for ages been spoken in either. Norman influence has been far stronger in England than in Sicily, and signs of Norman presence are far more easily recognized. But the Norman, as a distinct people, is as little to be seen in the one island as in the other, a result due to different and almost opposite causes. The whole circumstances of the conquest of England constrained the conquerors to become Englishmen in order to establish themselves in the conquered land. In William's theory, the forcible conquest of England by strangers was an untoward accident. The lawful heir of the English crown was driven against his will to win his rights by force from outside. But he none the less held his crown as an English king succeeding according to English law. Moreover, every Norman to whom he granted lands and offices held them by English law in a much truer sense than the king held his; he was deemed to step into the exact position of his English predecessor, whatever that might be. This legal theory worked together with other causes to wipe out all practical distinction between the conquerors and the conquered in a wonderfully short time. By the end of the 12th century the Normans in England might fairly pass as Englishmen, and they had largely adopted the use of the English language. The fashionable use of French for nearly two centuries longer was far more a French fashion than a Norman tradition. When the tradition of speaking French had all but died out, the practice was revived by fashion. Still the tradition had its effect. The fashion could hardly have taken root except in a land where the tradition had gone before it.

The Normans in England therefore became Englishmen, because there was an English nation into which they could be absorbed. The Normans in Sicily could hardly be said to become Sicilians, for there assuredly was no Sicilian nation for them to be absorbed into. While the Normans in England were lost among the people of the land, the Normans in Sicily were lost among their fellow-settlers in the land. The Normans who came into Sicily must have been much less purely Norman than the Normans who came into England. Indeed, we may doubt whether the Norman invaders of Sicily were Norman in much more than being commanded by Norman leaders. They were almost as little entitled to be called pure Scandinavians as the Saracens whom they found in the island were entitled to be called pure Arabs. The conquest of England was made directly from Normandy, by the reigning duke, in a comparatively short time, while the conquest of Sicily grew out of the earlier and far more gradual conquest of Apulia and Calabria by private men. The Norman settlements at Aversa and Capua were the work of adventurers, making their own fortunes and gathering round them followers from all quarters. They fought simply for their own lands, and took what they could by the right of the stronger. They started with no such claim as Duke William put forth to justify his invasion of England; their only show of legal right was the papal grant of conquests that were already made. The conquest of Apulia, won bit by bit in many years of what we can only call freebooting, was not a national Norman enterprise like the conquest of England, and the settlement to which it led could not be a national Norman settlement in the same sense. The Sicilian enterprise had in some respects another character. By the time it began the freebooters had grown into princes. Still there was a wide difference between the duke of the Normans and the duke of Apulia, between an hereditary prince of 150 years' standing and an adventurer who had carved out his duchy for himself.

The characteristic point of Norman rule in Sicily is that it is the rule of princes who were foreign to all the inhabitants of the island, but who were not more foreign to the inhabitants of the island than different classes of them were to one another. The Norman conqueror found in Sicily a Christian and Greek-speaking people and a Muslim and Arabic-speaking people. The relations between the two differed widely in different parts of the island, according to the way in which the Saracens had become possessed of different towns and districts. In one place the Christians were in utter bondage, in another they were simply tributary; still, everywhere the Muslim Saracen formed the ruling class, the Christian Greek formed the subject class. We speak of the Saracen very much as we speak of the Norman; for of the Muslim masters of Sicily very many must have been only artificial Arabs, Africans who had adopted the creed, language and manners of Arabia. In each case the Arab or the Norman was the kernel, the centre round which all other elements gathered and which gave its character to the whole. Besides these two main races, Greek and Saracen, others came in through the Norman invasion itself. There were the conquerors themselves; there were the Italians, in Sicily known as Lombards, who followed in their wake; there were also the Jews, whom they may have found in the island, or who may have followed the Norman into Sicily, as they certainly followed him into England. The special character of Norman rule in Sicily was that all these various races flourished, each in its own fashion, each keeping its own creed, tongue and manners, under the protection of a common sovereign, who belonged to none of them, but who did impartial justice to all. Such a state of things might seem degradation to the Muslim, but it was deliverance to the native Christian, while to settlers of every kind from outside it was an opening such as they could hardly find elsewhere. But the growth of a united Sicilian nation was impossible; the usual style to express the inhabitants of the island is "omnes" or "universi Siciliae populi." In the end something like a Sicilian nation did arise; but it arose rather by the dying out of several of the elements in the country, the Norman element among them, than by any such fusion as took place in England.

Normans in Scotland, Wales and Ireland.—From England, the Norman spread into Scotland, Wales and Ireland. In Scotland he was not a conqueror, but a mere visitor, and oddly enough he came as a visitor along with those whom he had himself overcome in England. Both Normans and English came to Scotland in crowds in the days of Margaret, Edgar and David, and Scottish national feeling sometimes rose up against them. In Scotland again the Norman settlers were lost in the mixed nationality of the country, but not till they had modified many things in the same way in which they modified things in England. They gave Scotland nobles and even kings; Bruce and Balliol were both of the truest Norman descent; the true Norman descent of Comyn might be doubted, but he was of the stock of the Francigenae of the Conquest. In Wales the Norman came as a conqueror, more strictly a conqueror than in England; he could not claim Welsh crowns or Welsh estates under any fiction of Welsh law. The Norman settler in Wales, therefore, did not to any perceptible extent become a Welshman. In Ireland the Norman was more purely a conqueror than anywhere else; but in Ireland his power of adaptation caused him to sink in a way in

which he sank nowhere else. While some of the Norman settlers in Ireland went to swell the mass of the English of the Pale, others threw in their lot with the native Irish, and became, in the well-known saying, *Hibernis ipsis Hiberniores* (see BOROUGH).

NORMANTON: *see* CARPENTARIA, GULF OF.

NORMANTON, an urban district in the West Riding of Yorkshire, England, 3 mi. N.E. of Wakefield, on the L.M.S. and L.N.E. railways. Pop. (1938) 17,962. Area, 4.8 sq.mi. It is in the Calder valley, 1½ mi. from the right bank of the river, and is a railway junction for the line from Manchester to Leeds via Wakefield, and for the main line from the south via Chesterfield. A mound in the neighbourhood, called Haw hill, is believed to be a barrow. Traces remain of a moat surrounding the town, which is now a colliery district. Altofts, a neighbouring parish, was the home of Sir Martin Frobisher.

NORNS, in Northern mythology, the female divinities of fate, like the Gr. Μοῖραι generally represented as three in number, and said to spin, or weave, the destiny of men. They dwell beside the "Spring of fate," beneath the "world-tree," Yggdrasil's ash, which they water from the spring. Sometimes the Norns are indistinguishable from the Valkyries (*q.v.*). They appear as prophetesses (*völur*) at the birth of children. The most famous story is contained in the *Tháttr af Nornagesti.* (*See* TEUTONIC PEOPLES.)

NORRIS, FRANK (1870–1902), American novelist, was born in Chicago (Ill.), March 5, 1870. Believing that America ignored her own national epic, he devoted himself to his uncompleted trilogy of the wheat. *The Octopus* (1901) shows with a striking use of symbolism the raising of the wheat in California and the hold of the railway upon the ranchmen; *The Pit* (1903) is a powerful portrayal of the lure of board of trade gambling; the author's early death prevented completion of the third volume, dealing with consumption in Europe. Reared in Chicago (Ill.), educated at the San Francisco high school, the University of California, and Harvard, he studied art in Paris and served in South Africa as war correspondent for the San Francisco *Chronicle*. In 1896–97 he was associate editor of the San Francisco *Wave;* and in 1898 he was war correspondent in Cuba for *McClure's Magazine*. He died Oct. 25, 1902.

Besides the wheat trilogy, Norris's most important works are: *A Deal in Wheat, and Other Stories of the New and Old West* (1903); *The Third Circle* (1909), another collection of tales; *The Responsibilities of the Novelist, and Other Literary Essays* (1903); *Moran of the Lady Letty* (1898), a tale of adventure off the California coast; *Blix* (1899), a love story; *McTeague* (1899), a story of the San Francisco slums; and *Vandover and the Brute* (1914), a repulsive study of degeneration, issued with an introduction by Charles G. Norris. For a bibliography *see* F. T. Cooper's *Some American Story Tellers* (1911).

NORRIS, GEORGE WILLIAM (1861–1944), U.S. legislator, was born on a farm in Sandusky county, Ohio, on July 11, 1861. The death of his father and only brother while he was very young left the family in straitened circumstances, and Norris was required to work out among the farmers in the summer and attend school only in the winter. He afterwards taught school and studied law, and earned enough to finish his law course at Valparaiso university. He was admitted to the bar in 1883. In 1885 he moved to McCook, Neb., and began to practise. He was later elected prosecuting attorney of Furnas county, and in 1895 district judge of the 14th judicial district; re-elected in 1899, he was serving in this position when in 1902 he became a U.S. representative. He was re-elected for five successive terms and in 1910 was the leader of the insurgent group which successfully held out for a reform of house rules, and thus put an end to the autocratic control of the speaker. He also led the fight against secret committee meetings. Norris was elected to the senate in 1912 and served with that body until 1942, thus finishing 40 years in congress. He voted against the entrance of the U.S. into World War I, and denounced the Versailles Treaty. He fought for the direct election of senators, and for presidential primaries, and was the author of the 20th Amendment, which abolished "lame-duck" congresses. Norris favoured strict restrictions on private power interests; and the Norris bill for the retention by the government of the Muscle Shoals power development, the Tennessee Valley authority which he fathered and fought through congress, and the Norris dam are the result of his efforts to provide publicly produced electric power. He was a leader in the demand for farm relief legislation, and the leader of the independent group in congress. Though nominally a Republican, party ties rested lightly upon him, his dictum being that the people "ought to be independent of all parties." He backed the Roosevelt New Deal administration wholeheartedly because he believed it would carry out his own aims for governmental reform. His last fight was an unsuccessful attempt to pass anti-poll tax legislation. Senator Norris died Sept. 3, 1944, in McCook, Neb.

NORRIS, HENRY NORRIS or **NORREYS, BARON** (*c.* 1525–1601), belonged to an old Berkshire family, many members of which had held positions at the English court. His father, Henry Norris, was a grandson of Sir William Norris, who commanded the royal troops against Lambert Simnel at the battle of Stoke in 1487. Like his brother John (d. 1564), the elder Henry Norris obtained a post at the court of Henry VIII.; he gained the king's favour and was rewarded with many lucrative offices. He belonged to the party which favoured the elevation of Anne Boleyn; but in May 1536 he was arrested on the charge of intriguing with her, and though he was probably innocent of any serious offence, he was beheaded on May 17, 1536. His son Henry regained some of his father's lands and entered upon court life, being a member of parliament under Edward VI. During Mary's reign he was one of those who were entrusted with the custody of the princess Elizabeth, and when the princess became queen she amply repaid the kindness which Norris had shown to her when he was her guardian at Woodstock. In 1566 he was knighted and sent as ambassador to France, where he remained until 1570, and in 1572 he was created Baron Norris of Rycote. He died in June 1601.

The eldest of his six sons, Sir WILLIAM NORRIS, died in Ireland in Dec. 1579, leaving a son Francis (1579–1623), who succeeded to his grandfather's barony and also to the estates of his uncle Sir Edward Norris. In 1621 Francis was created earl of Berkshire. He left no sons and the earldom became extinct, but the barony descended to his daughter Elizabeth (d. 1645), the wife of Edward Wray (d. 1658). Their daughter Bridget (1627–57) married as his second wife Montagu Bertie, 2nd earl of Lindsey, and their son James Bertie (1654–99) became Baron Norris (or Norreys) in 1657, and was created earl of Abingdon in 1682. His descendants the Berties, earls of Abingdon, still hold this barony.

Sir EDWARD NORRIS (d. 1603), the 1st Lord Norris's third son, served with the English troops in the Netherlands from 1585 to 1588. He is chiefly remembered owing to his fierce quarrel with Philip, count of Hohenlohe (1550–1606), called Hollock by the English, in August 1586 at Gertruydenberg.

NORRIS, SIR JOHN (*c.* 1547–1597), English soldier, was the second son of Henry Norris, Baron Norris of Rycote, and gained his earliest military experience in the civil wars in France. In 1573 he went to Ulster with Walter Devereux, earl of Essex, winning fame by his conduct in the guerrilla wars against the Irish, and being responsible for the massacre on the island of Rathlin in July 1575. He was again in Ireland in 1584, but the greater part of these years was spent in service in the Netherlands. In 1588, when the Spanish Armada was expected, he was marshal of the camp at Tilbury; later in the same year he served the queen as ambassador to the Dutch states, and in 1589 he and Sir Francis

Drake led the fleet which ravaged the coasts of Spain and Portugal. In 1591, and again in 1593, he aided Henry IV. of France in his struggle with the League in Brittany; and in May 1595 he landed again in Ireland, where he was lord president of Munster. He was to assist the lord deputy, Sir William Russell, in subjugating Ulster. After fighting and negotiating with the O'Neills in Ulster, and warring in Connaught, he asked for his recall. This was not granted, but he was supplanted in his military command; and he retired to Munster and died at Mallow on July 3, 1597. His monument is in the church of Tattendon, Berkshire.

See J. L. Motley, *The United Netherlands,* vol. ii. (1904); and R. Bagwell, *Ireland under the Tudors,* vol. iii. (1890).

NORRIS, JOHN (1657–1711), English philosopher and divine, was born at Collingbourne-Kingston in Wiltshire. He was educated at Winchester and Exeter college, Oxford, being subsequently elected to a fellowship at All Souls'. His first original work was *An Idea of Happiness* (1683), in which, with Plato, he places the highest happiness or fruition of the soul in the contemplative love of God. He studied the works of Malebranche and of Descartes and his followers and opponents. Of English thinkers, More and Cudworth, the so-called Cambridge Platonists, had influenced him most; and in 1685 his study of their works led to a correspondence with More, published after his death by Norris as an appendix to his Platonically conceived essay on *The Theory and Regulation of Love* (1688). He also corresponded with Mrs. Astell (*q.v.*) and Lady Masham, the friend of Locke, to whom he addressed his *Reflections upon the Conduct of Human Life* (1689). In 1689 Norris was presented to the living of Newton St. Loe, in Somersetshire. In 1690 he published a volume of *Discourses upon the Beatitudes,* followed by three more volumes of *Practical Discourses* between 1690 and 1698. In an appendix to his *Discourses* he gave "Cursory Reflections" on Locke's *Essay on the Human Understanding* which anticipate many later criticisms of Locke's philosophy, though he was at one with Locke in dismissing the "grey-headed, venerable doctrine" of innate ideas. The last 20 years of Norris's life were spent at Bemerton, to the living of which he had been transferred in 1691. In 1691–1692 he was engaged in controversy with his old enemies the "Separatists," and with the Quakers, his Malebranchian theory of the divine illumination having been confounded by some with the Quaker doctrine of the light within. In 1697 he wrote *An Account of Reason and Faith,* one of the best of the many answers to Toland's *Christianity not Mysterious.* Reason, according to Norris, is nothing but the exact measure of truth, that is to say, divine reason, which differs from human reason only in degree, not in nature. In 1701 appeared his most important work, *An Essay towards the Theory of the Ideal or Intelligible World.* The first volume treats the intelligible world absolutely; the second, which appeared in 1704, considers it in relation to human understanding. It is a complete exposition of the system of Malebranche, in which Norris refutes the assertions of Locke and the sensualists. In 1708 Norris wrote *A Philosophical Discourse concerning the Natural Immortality of the Soul,* defending that doctrine against the assaults of Dodwell. He died at Bemerton, and a monument was erected to his memory in the church. He occupies a place in the succession of ecclesiastical and mystical thinkers of whom Coleridge is the last eminent example.

See Wood, *Athenae Oxonienses* (ed. Bliss), iv.; *Biographia Britannica;* Leslie Stephen in *Dictionary of National Biography;* J. Tulloch, *Rational Theology and Christian Philosophy in England in the 17th Century* (1874), who calls Norris "as striking and significant a figure in the history of English philosophy," as Berkeley, another idealist.

NORRIS, WILLIAM EDWARD (1847–1925), English novelist, was born on Nov. 18, 1847, the son of Sir W. Norris, chief justice of Ceylon. He was educated at Eton, and called to the bar at the Inner Temple in 1874. His first story, *Heaps of Money,* appeared in 1877, and was followed by *Mademoiselle de Mersac* (1880), *Matrimony* (1881), *No New Thing* (1883), *My Friend Jim* (1886), *The Despotic Lady* (1895), *Matthew Austin* (1895), *The Widower* (1898), *Pauline* (1908), *Not Guilty* (1910); *The Rt. Hon. Gentleman* (1913); *Barbara and Company* (1914); *The Triumphs of Sarah* (1920); *Sabine and Sabina* (1922); *Next of Kin* (1923) and *Trevalion* (1925). He died on Nov. 19, 1925.

NORRISTOWN, a borough of Pennsylvania, U.S., the county seat of Montgomery county; on the Schuylkill river, 17 mi. N.W. of the centre of Philadelphia. It is served by the Pennsylvania, Reading and Philadelphia & Western railways. Pop. 38,193 in 1950. Across the river is the borough of Bridgeport (pop. 5,823 in 1950). Norristown is a residential community; its principal industries are textiles, laminated plastics, mine products, beverages and machinery. The Norristown State hospital, an institution for mental cases, is there. Valley Forge (*q.v.*) is 6 mi. S.W. of the borough. The site of Norristown is part of a manorial estate purchased from William Penn in 1704 by Isaac Norris. The borough was incorporated in 1812.

NORRKÖPING, the fourth town of Sweden, in the district (*län*) of Östergötland, 113 m. S.W. of Stockholm by the Malmö railway. Pop. (1945) 78,255. A bull of Pope Lucius III shows that Norrköping existed in 1185. In the 17th century, Duke John of Östergötland introduced German craftsmen into Norrköping. Under Charles XII. the town suffered not only from war but from pestilence, 2,700 of its inhabitants perishing in 1710–1711. After the Russian invasion of 1719 the population was only 2,600. Norrköping occupies both banks of the Motala, the wide and rapid emissary of lake Vetter. Fires in 1719, 1812, 1822 and 1826 have caused rebuilding on modern lines. The falls in the river afford motive power to the cloth and cotton mills (spinning and weaving)—the staple industries —and to factories for sugar, paper, lithography, tobacco and carpets, joinery works and breweries. There are also shipbuilding yards and docks. Fine granite is quarried at Grafversfors, 7½ m. north. The inlet of Bråvik affords excellent harbour facilities for vessels up to 18½ ft. draught near the quay, and safe anchorage up to 30 ft. in the Pampas roads, 6 m. from the town.

NORSE LANGUAGE. The *Old Norwegian* language (till the Reformation) was not, like the modern language, confined to Norway and the Färoe islands, but was for some time spoken in parts of Ireland and the north of Scotland, the Isle of Man, the Hebrides, Shetland and Orkney (where it continued to the end of the 18th century), and also in certain parts of western Sweden.

The runic inscriptions in Old Norse are few in number (about 150) and of trifling philological importance, since they belong almost wholly to the period between 1050 and 1350, and are consequently not much earlier than the earliest literature. The whole literature preserved is written in the Latin alphabet. The earliest manuscripts are not much later than the oldest Old Icelandic ones and are of the greatest interest. The masses of charters which occur throughout the whole middle age of Norway from the beginning of the 13th century give information, especially of dialect.

In Old Norwegian the most primitive forms occur in old poems from times as remote as the days of Þorbiorn Hornklofi (end of the 9th century). The language at this epoch differed very little from other Scandinavian dialects. From the 13th century, Norwegian, owing to geographical and political circumstances, is considerably influenced by the eastern Scandinavian languages. The tendency in Norwegian to reduce the use of the so-called *u*-Umlaut has already appeared. There appears another kind of vowel-assimilation, almost unknown to Icelandic, the vowel in terminations being in some degree influenced by the vowel of the preceding syllable. Thus, for instance, we find in some manuscripts that the vowels *e, o, ø,* and long *a, æ,* are followed in terminations by *e, o; i, u, y* and short *a, æ,* on the other hand, by *i, u*—as in *bøner,* prayers, *konor,* women; but *tiðir,* times, *tungur,* tongues. The same fact occurs in certain Old Swedish manuscripts. When Norway had been united later with Sweden under one crown (1319) we meet pure Suecisms in the Norwegian literary language. In addition to this, the 14th century exhibits several differences from the old language: *rl, rn* are sometimes assimilated into *ll, nn*—as *kall* (elder *karl*), man, *konn* (*korn*), corn, *prestanner* (*prestarnir*), the priests; *i* passes into *y* before *r, l*—as *hyrðir* (*hirðir*), shepherd, *lykyl* (*lykill*), key; final *-r* after a consonant is changed into *-ar, -er, -ir, -or, -ur* or *œr,* sometimes only *-a, -e, œ*—as *hester* (*hestr*), horse, *bøker* (*bøkr*), books, the names Þolleifœr (Þorleifr), Guðlæifæe (Guðleifr). About the beginning of the 15th cen-

tury initial *kv* occurs for old *hv* (not, however, in pronouns, which take *kv* only in western Norway), as the local name *Quiteseið* (*hvitr*, white). During the 15th century, Norway being united with Denmark, and at intervals also with Sweden, a great many Danisms and a few Suecisms are imported into the language. Towards the end of the middle ages the Danish influence shows an immense increase, until at last Norwegian as a literary language is supplanted by Danish. Many Norse dialects developed in the 13th, 14th and 15th centuries. The language of western Norway resembles Icelandic, and the language of eastern Norway is still nearer to contemporary Old Swedish. The present dialectical division was in all essentials accomplished about the year 1600.

NORTH, BARONS. The English title of Lord North of Kirtling was created for Edward North (*c.* 1496–1564), son of Roger North, a London citizen, in 1554; he was a successful lawyer, clerk of the parliament (1531) and chancellor of the court of augmentations (1545). His second son was Sir Thomas North (*q.v.*), and he was succeeded as 2nd baron by his son Roger, a courtier and soldier of Queen Elizabeth's day, who married the daughter of Lord Chancellor Rich.

DUDLEY NORTH, 3rd Baron North (1581–1666), son of Sir John North and of Dorothy, daughter and heiress of Sir Valentine Dale, was born in 1581 and succeeded his grandfather, the 2nd Baron North, at the age of 19. He was educated at Cambridge, and married in 1599 Frances, daughter of Sir John Brockett of Brockett Hall, Hertfordshire. He travelled in Italy, took part in the campaign of 1602 in the Netherlands, and on his return became a conspicuous figure at court, excelling in athletic exercises as well as in poetry and music, and gaining the friendship of Prince Henry. In 1606, while returning from Eridge to London, he discovered the springs of Tunbridge Wells, which cured North himself of a complaint and quickly became famous. He also recommended the Epsom springs to the public. He supported and subscribed to the expedition to Guiana made by his brother Roger North (*c.* 1582–*c.* 1652) in 1619, and when Roger departed without leave Dudley was imprisoned for two days in the Fleet. In 1626 he attached himself to the party of Lord Saye and Sele in the Lords, who were in sympathy with the aims of the Commons; and when the civil war broke out he was on the side of the parliament. In 1641 he was a member of the Lords' committee on Religion, and served on the committee to consider Laud's attainder in 1644, finally voting for the ordinance in Jan. 1645. He was placed on the admiralty commission in 1645, and acted as lord lieutenant for Cambridgeshire. He was one of the small group of Lords who continued attendance in the House of Peers, and on Dec. 19, 1648, with three others, visited Fairfax, when they "cast down their honours at his Excellency's feet" and protested their desire not to retain any privileges prejudicial to the public interest. (Gardiner's *Civil War*, iv. 285.) He passed the rest of his life in retirement at Kirtling in Cambridgeshire, with his family, finding "employment with many airy entertainments as poetry, writing essays, building, making mottoes and inscriptions as well as in music." He wrote *A Forest of Varieties* (1645), a miscellany of essays and poems, another edition of which was published in 1659 under the title of *A Forest promiscuous of various Seasons' Productions.* He died on Jan. 16, 1666. North is described as "full of spirit and flame," of imperious temper but of well-balanced judgment, Lord Holland declaring that "he knew no man less swayed with passion and sooner carried with reason and justice." He left, besides one daughter, two sons, the elder of whom, Sir Dudley, succeeded him as 4th Baron North.

DUDLEY NORTH, 4th Baron North (1602–77), increased the family fortune by marrying the daughter of Sir Charles Montagu, brother of the 1st earl of Manchester. He was an accomplished man, of studious bent, and had 14 children, of whom the third son, Francis, became lord chancellor as Lord Guilford; the fourth was Sir Dudley North (*q.v.*), the economist; the fifth, John (1645–83), master of Trinity, Cambridge, and professor of Greek in the university; and the sixth, Roger (*q.v.*), the lawyer and historian.

The eldest son, Charles (d. 1691), was created Lord Grey of Rolleston during his father's life, and succeeded his father as 5th Baron North; and on the death of his son, William, 6th Lord North, without issue, in 1734, the barony of North went to a cousin, Francis North, 3rd baron, afterwards 1st earl of Guilford. The title of Lord North is that by which the 2nd earl of Guilford, prime minister from 1770–82, is best known in history. (*See* GUILFORD, BARONS AND EARLS OF.)

George Augustus, 3rd earl of Guilford (d. 1802), left three daughters, and the barony of North fell into abeyance till 1841 when it vested in Susan, Baroness North (1797–1884), wife of John Sidney Doyle, who took the name of North; at her death her son William Henry John North (b. 1836) succeeded as 11th baron, the title now being separate from that of Guilford.

NORTH, SIR DUDLEY (1641–1691), English economist, was 4th son of Dudley, 4th Lord North, who published *Passages relating to the Long Parliament,* of which he had himself been a member. He was born on May 16, 1641, and in his youth was carried off by gipsies and recovered with some difficulty by his family. He engaged in foreign trade, especially with Turkey, and spent many years at Constantinople and Smyrna. During the Tory reaction under Charles II. he was one of the sheriffs forced on the city of London with an express view to securing verdicts for the Crown in state trials. He was knighted, and was appointed a commissioner of customs, afterwards of the treasury, and again of the customs. Under James II., "he took," says Roger North, "the place of manager for the Crown in all matters of revenue." After the Revolution he was called to account for his alleged unconstitutional proceedings in his office of sheriff. He died on Dec. 31, 1691.

His tract entitled *Discourses upon Trade, principally directed to the cases of the interest, coinage, clipping and increase of money,* was published anonymously in 1691, and was edited in 1856 by J. R. M'Culloch in the *Select Collection of Early English Tracts on Commerce* printed by the Political Economy Club of London. In this emphatic assertion of the free-trade doctrine against the prevailing system of prohibitions, North shows that wealth may exist independently of gold or silver, its source being human industry, applied either to the cultivation of the soil or to manufactures. The export of money in the course of traffic, instead of diminishing, increases the national wealth, trade being only an exchange of superfluities. Nations are related to the world just in the same way as cities to the State or as families to the city. North emphasizes more than his predecessors the value of the home trade. With respect to the interest of capital, he maintains that it depends, like the price of any commodity, on the proportion of demand and supply, and that a low rate is a result of the relative increase of capital, and cannot be brought about by arbitrary regulations. In arguing the question of free trade, he urges that every advantage given to one interest over another is injurious to the public and that no trade is unprofitable to the public.

North, Locke and Petty are named by Wilhelm Roscher as the "great triumvirate" of English economists of the period.

NORTH, MARIANNE (1830–1890), English naturalist and flower-painter, was born at Hastings on Oct. 24, 1830, the eldest daughter of a Norfolk landowner, descended from Roger North (1653–1734). She trained as a vocalist under Madame Sainton Dolby, but her voice failed, and she then devoted herself to painting flowers. After the death of her parents she resolved to paint the flora of distant countries and with this objective she went to Canada, the United States and Jamaica, and spent a year in Brazil, where she did much of her work at a hut in the depths of a forest (1871–72). Later, she visited Teneriffe, California, Japan, Borneo, Java, Ceylon, Australia, New Zealand, South Africa, the Seychelles and Chile; and the scientific accuracy with which she represented plant life gives her work a permanent value. In 1882, her gallery at Kew Gardens was opened. It contains her paintings. She died at Alderly in Gloucestershire on Aug. 30, 1890.

NORTH, ROGER (1653–1734), English lawyer and biographer, was the sixth son of the 4th Baron North. He acquired a good practice at the bar, being helped by his elder brother Francis, who became lord chancellor and was created Baron Guil-

ford (*q.v.*), and in 1684 he became solicitor-general. But the Revolution stopped his advancement, and he retired to his estate of Rougham in Norfolk, and increased his fortune by marrying the daughter of Sir Robert Gayer. He collected books, and was constantly occupied in writing. He is best known for his *Lives of the Norths,* published after his death, together with his own autobiography (*see* the edition in Bohn's *Standard Library,* 1890, by Jessopp), a classic authority for the period. He died at Rougham on March 1, 1734.

He is to be distinguished from Roger North (1585–1652), brother of the 3rd baron, one of the captains who sailed with Raleigh in 1617, and who projected the plantation of Guiana.

NORTH, SIR THOMAS (1535?–1601?), English translator of *Plutarch,* second son of the 1st Baron North, was born about 1535. He is supposed to have been a student of Peterhouse, Cambridge, and was entered at Lincoln's Inn in 1557. In 1574 he accompanied his brother, Lord North, on a visit to the French court. He served as captain in the year of the Armada, and was knighted about three years later. He was a justice of the peace for Cambridge in 1592 and again in 1597, and he received a pension (£40 a year) from the queen in 1601. He translated, in 1557, Guevara's *Reloj de Principes* (commonly known as *Libro Aureo*) (*see* Guevara, Antoñio de) under the title of *Diall of Princes.* The English of this work is one of the earliest specimens of the ornate, copious and pointed style for which educated young Englishmen had acquired a taste in their continental travels and studies. With its mannerisms and constant use of antithesis, it set the fashion which was to culminate in Lyly's *Euphues.* His next work was *The Morall Philosophie of Doni* (1570), a translation of an Italian collection of eastern fables. The first edition of his translation of *Plutarch,* from the French of Jacques Amyot, appeared in 1579. The first edition was dedicated to Queen Elizabeth, and was followed by other editions in 1595 and 1603, containing in each case fresh *Lives.* The influence of North's vigorous English on contemporary writers was very great, and some critics have called him the first master of English prose. The book formed the source from which Shakespeare drew the materials for his *Julius Caesar, Coriolanus* and *Antony and Cleopatra.* It is in the last-named play that he follows the *Lives* most closely, whole speeches being taken direct from North.

See Plutarch's Lives of the Noble Grecians and Romans: English ed. by Sir T. North (in Tudor Translations, 1895); *Shakespeare's Plutarch* (a selection ed. C. F. T. Brooke, 1909); *The Diall of Princes* (reprinted 1921); F. Bushby, *Three Men of Tudor Times* (1911).

NORTH, THE, originally those of the English Colonies in America north of the Mason and Dixon line (*q.v.*), as distinguished from those south. They were New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey and Pennsylvania. With the extension of settlements across the Alleghenies, the Ohio river was considered as a continuation of the Mason and Dixon line to the Mississippi river. Missouri, west of the Mississippi, was before the Civil War, considered part of the South because it was a slave-holding State, but after the Civil War it became a part of the North in its political and economic life. West of Missouri the boundary between the two sections followed the southern boundary of Kansas (37° N. lat.) to the Great Plains. Beyond were the Western States which, because they supported the North, were usually considered part of it during the great struggle over slavery. The characteristic Northern life and settlement was broken, however, by the Great Plains which may, therefore, be considered to form the western boundary of the section.

The division between the North and the South was in no slight degree a natural one. In the North land and climate made small farms with diversified crops the only profitable type of agriculture. In the older sections the limited supply of farm land and the abundant amount of water-power stimulated manufacturing and the growth of town life. In the South, large plantations growing only cotton, or only tobacco, and dependent upon slave labour came into existence. As these economic systems with their attendant social differences grew in power and clashed in conflict over the virgin lands of the West, an intense struggle developed for supremacy, a struggle fought first, but vainly, in the halls of Congress, and later on the battlefields of the Civil War. The North through its victory gained undisputed political, economic and cultural supremacy. Politically, the North has always been the stronghold of the Republican Party which has fostered its industrial interests.

NORTH ADAMS, a city of Massachusetts, U.S., on the Hoosac river and at the west end of the Hoosac tunnel, served by the Boston and Albany and the Boston and Maine railways. Pop. (1950) 21,475; and by the census of 1940, 22,213.

The city has a beautiful situation, 700 ft. above sea level, in the foothills of the Berkshires, at the west end of the Mohawk trail. Within its limits is a natural bridge 50 to 60 ft. high, across Hudson brook. It is the seat of the Massachusetts State Teachers college (1897) and has extensive manufactures (chiefly cotton print, woollen goods, cotton cloth, boots and shoes, machinery and electric condensers). In the western part of the city are the ruins of Ft. Massachusetts, built in 1745 by the Massachusetts Bay colony as a frontier defense, and captured in 1746 by French and Indians under the Chevalier de Vaudreuil. North Adams was set off from Adams and incorporated as a town in 1878, and in 1895 it was chartered as a city.

NORTHALLERTON, an urban district, market town and administrative capital of the North Riding of Yorkshire, England, 30 mi. N.N.W. of York by the L.N.E. railway, on which it is an important junction. Pop. (est. 1938) 4,970. Area 5.7 sq.mi. It is on a slight eminence at the foot of the Cleveland and Hambleton Hills, 3 mi. from the bank of the Swale. It thus avoids the flood land of the Vale of York. Here the western scarp of the Wolds causes the Vale to narrow to a width of 10 mi. forming the Northallerton Gate.

Northallerton (Alvetune, Allerton) is believed to have been a Roman station, and the importance of the Gate is marked by two Roman roads, one running north from Catterick, the other from York. It was probably later a Saxon "burgh," and a Danish settlement, but nothing is known with certainty about it before the account given in the Domesday Survey, which shows that the Normans had destroyed the manor so utterly that it was still waste in 1086. In mediaeval times, the Gate was an obvious way south into England for the Scottish army. The Battle of the Standard was fought near the town in 1138 and the castle was destroyed in 1174. In 1317, the town was burned by the Scots under Robert Bruce. Soon after his accession, William Rufus gave Northallerton to the Bishop of Durham, whose successors continued to hold it until it was taken over by the ecclesiastical commissioners in 1865. There are now no traces of the fortified palace of the bishops. A priory was founded here in 1341, and a White Friars monastery in 1354, and all trace of these also has been lost. The Mount Grace priory, a Carthusian foundation of 1397, remains.

According to an inquisition taken in 1333, the town, markets and fairs were held by the burgesses who were governed by two reeves and the bishop's bailiff. This form of government continued until 1851, when a local board was formed, and this was superseded by an urban district council in 1894. As a borough by prescription, Northallerton returned two members to the parliament of 1298, but it was not represented again until 1640 when its earlier privileges were restored. From 1832 to 1885 it returned one member but is now in the Richmond division. The North Riding county library was opened in 1924 with headquarters at Northallerton. By 1943 it had 490 branches. The town has a considerable trade in dairy farming and has held a weekly market since 1205. There are flour mills, linoleum works, tanning and the manufacture of cart covers and tent cloths. A fair held on St. Bartholomew's day was famous for cattle in the 16th century, but it is no longer held. Northallerton is the railway focus of the Gate.

See C. J. D. Ingledew, *History and Antiquities of Northallerton in the County of York* (1858); J. L. Saywell, *History and Annals of Northallerton* (1885); *Victoria County History, Yorkshire.*

NORTH AMERICA. The continent of North America has a mean altitude of about 2,000 ft., and an area of about 9,000,000 sq.mi., 16% of the earth's land area and 4.5% of the earth's entire surface. Certain correspondences of its geological structure and history with those of the greater part of Europe and Asia, sym

metrically disposed, right and left, with respect to the Atlantic, support the view that Eurasia is a single continent: furthermore they controvert the idea that the new world of discovery is an old world geologically; and that the old world of history is geologically new. Both worlds are in part old, in part new; both share structures and changes of similar dates from the most ancient to the most modern periods.

PHYSICAL FEATURES

The Laurentian Region.—The general structural features of North America are (*see* map): the extensive area of ancient crystalline rocks, stretching from Labrador past Hudson bay and thence northwestward to the Arctic ocean, is of disordered structure; the surface now seen must have been originally buried at a considerable depth beneath a higher and mountainous surface; but that higher surface was reduced to low relief at a remote period. The Laurentian part of this great region has been described as the first emerged land area of North America, around which many later additions on the south and west built up the present continent; but a more modern interpretation shows that the worn-down Laurentian region is only part of a much larger land mass which in pre-Palaeozoic time extended more or less continuously as far as Texas and parts of the Rocky mountain region, and on which marine deposits were unconformably deposited as the land mass was progressively submerged beneath the Palaeozoic ocean. Hence the Laurentian region differs from other parts of North America more in having escaped later deformation than in being of earlier origin. In Pleistocene time, the Laurentian region became the centre from which ice sheets spread out on all sides. As a result the weathered soils were swept away, together with an unknown measure of unweathered rock, leaving scattered boulders and gravelly drift upon a rugged upland without mountains (except in Labrador) but diversified by innumerable knobs and hollows, and here and there covered by clay belts that are arable in spite of severe winter climate. The drainage of the region, which in pre-glacial times was probably accomplished by well-ordered rivers, was thus thrown into great disorder; large and small lakes abound, and some of the lakes have two outlets; the streams are repeatedly interrupted by rapids and not infrequently split into two channels, enclosing islands many miles in length. The region remains a forest wilderness, except at mining centres (several of which have produced large quantities of nickel, silver and gold), near pulp mills and on the sparsely settled clay belts.

The Appalachian Area.—This is a hilly and mountainous belt, stretching from Newfoundland to Alabama, with a western branch in Arkansas. It seems to have belonged in the earliest times to the great pre-Palaeozoic land mass, but it must be set aside from the undisturbed Laurentian region because of repeated movements of depression, deformation and elevation that it has suffered, generally along a northeast-southwest trend, causing alternations of heavy deposition and almost equally heavy degradation. These movements took place with generally decreasing intensity, through nearly the whole stretch of geological time covered by the fossiliferous record. The Appalachian mountains of today were formerly regarded as unconsumed residuals of greater mountains formed at the close of the Palaeozoic period; but it is now generally agreed that Mesozoic erosion reduced most of that ancient range to a lowland of moderate or small relief, leaving only isolated groups of subdued mountains in the areas of the most resistant rocks; and that the altitude and form of the mountains today, as well as of a belt of horizontal strata on the west, now known as the Allegheny plateau, are largely the result of Tertiary elevation and dissection of the previously worn-down mass; the additional height thus given to the subdued mountain groups made them the loftiest parts of the range today, as in the White mountains of New Hampshire (Mt. Washington, 6,293 ft.) and the Black mountains of North Carolina (Mt. Mitchell, 6,684 ft.). The Ozark plateau of Missouri and the Ouachita mountains of Arkansas and farther west are related to each other in much the same way as the Allegheny plateau and the middle and southern Appalachians. Numerous coal seams occupy discontinuous basins in the Appalachians from Nova Scotia to Pennsylvania, in the Allegheny plateau from Pennsylvania to Alabama, and in the extension of the same strata across the Ohio basin. The eastern coast of the continent has a rocky and irregular shore line from Greenland and Labrador to Massachusetts, with numerous submerged valleys forming bays and as many uplands and ridges outstanding in promontories and islands; this being the result of an increasing measure of depression to the north, where an archipelago now replaces what was probably once a corner of the continent.

A Coastal plain of gently inclined and imperfectly consolidated strata, which still borders the Gulf and part of the Atlantic coast of the United States, formerly extended northeast, probably at least as far as Nova Scotia; the same depression that has brought the ocean upon the older rocks from Massachusetts northward has diminished the breadth of the Coastal plain and embayed its shore line from North Carolina to the mouth of the Hudson, and has submerged it from the Hudson mouth, northeastward.

The Western Highlands.—The great complex of mountains in the Western highlands, sometimes styled the Cordilleras of North America (of which the Rocky mountains are eastern members in the United States and Canada), differs from the Eastern highlands in having suffered strong deformation in late geological periods. On the other hand, the transition from Palaeozoic to Mesozoic times, when mountain-making disturbances were so general in western Europe and eastern North America that earlier geologists thought them to be of world-wide extent, was here generally accomplished in relative quiet, so that in certain districts a conformable succession of stratified formations was accumulated in great thickness from Cambrian to late Mesozoic or early Tertiary time. Further, the Carboniferous period was marked by the deposition of marine limestones in the Cordilleran region. In contrast to the long quiescent Atlantic coast, the Pacific coast of North America is bordered for a good part of its length by mountains of late origin.

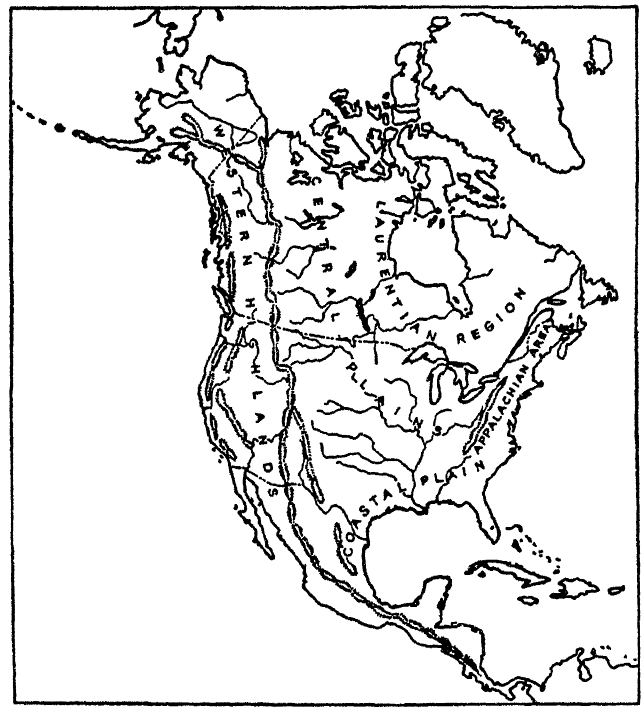
Volcanoes of commanding height here and there dominate the Western plateaus and mountains. Orizaba (18,314 ft.), Popocatepetl and their neighbours crown the southern portion of the Cordilleran system in Mexico; Mt. San Francisco rises over the desert plateau of Arizona and bears snow and Arctic plants; Shasta has small glaciers in northern California; Rainier, bearing large glaciers, surmounts the Cascade range in Washington; Wrangell is a lofty volcanic mass in Alaska. Vast lava floods have been poured out at various periods; those of the Snake and Columbia river basins in Washington, Oregon and Idaho are the most extensive. Similar lava-flows in British Columbia have been broadly uplifted and are now deeply dissected by Frazer river and its branches, leaving only disconnected highland patches.

As in all regions of great altitude, the erosion of valleys has progressed on a magnificent scale in the Cordilleran region. The plateaus of northern Arizona are traversed by the canyons of the Colorado river and its branches, at places over a mile in depth; yet upon the plateaus themselves, long and ragged cliffs of recession attest a vastly greater erosion before the uplift of the plateaus than is demanded by the canyons after uplift. Along the Pacific coast, as well as in the higher ranges of the northwest interior, intense glacial erosion during the Glacial period excavated huge cirques at the valley heads and deep troughs along the valley courses; on the coast these troughs are now occupied by sea water as fjords. Fitting complements to the deep erosion of the mountain masses are found in the great accumulations of mountain waste in various intermontane and piedmont basins, of which the so-called valley of California is the finest example. Similar basin deposits of Tertiary date abound in the Cordilleran region.

Central Plains.—Between the lower Eastern highlands and the higher Western highlands lies a great extension of medial plains, stretching in moderate altitude from the Arctic ocean to the Gulf of Mexico and having at their mid-length a breadth of 1,500 mi. They are composed throughout of nearly horizontal strata and mark a region long exempt from deformation. The eastern plains, best represented in the Ohio valley, are underlain by Palaeozoic strata, already mentioned as having been laid down

on the subsiding Archaean continent; the western plains are composed of Mesozoic and Tertiary strata. Both east and west large areas of the plains do not owe their present evenness to the preservation of their originally smooth surface, but to the degradation of that surface from the considerable altitude of its first uplift to low relief. The degraded surface has, however, been smoothed by veneers of till plains in the Ohio and upper Mississippi valleys, and by the addition of extensive piedmont detrital deposits in the central-western plains.

The Cordilleras of North and South America are not only far out of line with each other, but are separated by about 1,200 mi. in Central America, where, in association with the West Indies, an Antillean system of late geological deformation with east and west trends is believed to prevail, with abundant volcanic additions on the Pacific border and along the curved range of the Lesser Antilles, while in an intermediate space the calcareous lowlands of Yucatan resemble those of Florida in being the emerged parts of a larger area, much of which is still below the waters of the Gulf of Mexico. The warm waters that bathe the West Indies permit the growth of coral reefs in the Caribbean; the Bahamas are the slightly overtopping parts of broad platforms of calcareous deposits, of which the greater area constitutes extensive shallow banks which descend steeply to great depths.



PHYSIOGRAPHIC REGIONS OF NORTH AMERICA

Rivers.—The successive crustal movements by which North America has been developed have determined the growth of several great river systems. The broad upheavals which developed the medial plains had the effect of engrafting many rivers from the Eastern and Western highlands upon trunks of unusual dimensions. Thus the Mississippi system, some of whose eastern tributaries probably date from early Mesozoic times, received great reinforcement by the addition of many long western branches in late Tertiary time, roughly contemporaneous with the uplift of the southern Coastal plain, by which the lower trunk of the river was extended from its mid-length into the gulf. The present headwaters of that river-trunk to which the name Mississippi has been rather arbitrarily applied are of very modern date, as they are consequent upon the abundant glacial deposits of northern Minnesota; and relatively modern courses appear to have been taken by the earlier-born Ohio and Missouri around the margin of invading Canadian ice sheets, which displaced them from earlier courses. The evolution of the Mackenzie resembles that of the Mississippi in a general way, but it has presumably been much affected by glacial erosion and deposition, in consequence of which it, like the St. Lawrence, has many large lakes in its course. The regime of this great north-flowing river is strikingly unlike that of its south-flowing analogue on account of its course being from a warmer to a colder climate; hence while Mississippi floods have a free southward discharge, the floods of the Mackenzie have an obstructed northward discharge due to ice dams. Indeed, but for the complications that appear to be related to the outspread of Laurentian ice sheets, the areas drained by the Nelson and the St. Lawrence, now flowing to Hudson bay and St. Lawrence gulf, would be discharged by the Mackenzie and Mississippi. For a time, during the presence of the ice sheets, that simpler system was realized for the Mississippi, when it carried to the Gulf of Mexico much drainage now received by the St. Lawrence and Nelson; the flood plain of its lower trunk was probably given its great breadth at that time. Lake Superior is peculiar in apparently owing its great depth to a somewhat pronounced displacement of its basin floor, in addition to whatever deepening it gained by glacial erosion.

The chief rivers that discharge to the Pacific rank below those that discharge to the Atlantic; but the Yukon, flowing from farther Canada and inner Alaska, is one of the great rivers of the world. The Columbia, of hardly inferior rank, drains a large area of the Cordilleran system in Canada and the United States; it is peculiar in having one of its head branches rise at the eastern base of the Rocky mountains in Montana, so that its waters flow westward through all the Cordilleran ranges of its latitude. The Colorado discharges a muddy current into the Gulf of California.

Climate.—The climate of North America exhibits modifications of general conditions resulting from the globular form and eastward rotation of the earth. In January a mean temperature of zero or less invades the region northwest of Hudson bay, and extends as far south as the extreme central-northern United States, which thus resembles northeastern Asia in departing greatly from the more temperate mean prevailing in similar latitudes on the northern oceans. In July the great middle area of the continent becomes warmer than the oceans on the east and west, having a mean temperature ranging from 65° in the vicinity of the 50th parallel to above 80° south of the 35th parallel. Consequently the annual range between the means of January and July exceeds 40° for a large part of the continent, and exceeds 70° for much of the northern lands; the range of extreme temperatures is much greater. On corresponding northern oceanic areas, the temperature range is little more than 20°; and in the southern hemisphere it is probably less than 10°.

The several members of the planetary wind system, including therein the trades of a broadened torrid zone, the prevailing and westerlies of middle latitudes, and the irregular winds of the polar region, are well exemplified over North America; but they are better seen in the drift of clouds than in the movements of the surface winds. In consequence of the dominance of westerly winds, a great stretch of the Pacific coast, even as far north as Alaska, has a small annual temperature range (generally less than 20°); while a range more appropriate to continental interiors is experienced over most of the eastern coast of the continent in temperate latitudes; hence the extraordinary unlikeness between the climates of western Europe and eastern North America, where habitable Great Britain faces almost uninhabitable Labrador. The distribution of rainfall is likewise largely controlled by the general wind system. The West Indies, especially the mountainous islands, receive abundant precipitation from the passing trade winds. In Mexico and Guatemala the eastern slopes are for the most part better watered by the same winds (maximum, over 100 in.) than the western slopes. Farther north the reverse holds true; the Pacific coast north of latitude 40° has an abundant rainfall (maximum over 100 in.), and its mountains are clothed with dense forests; but there are large areas of deficient rainfall (less than 20 in.) in the interior where the intermontane and piedmont plains of the Cordilleras in middle latitudes are dry and treeless. Regions of heavy snowfall are chiefly in the far northwestern Cordilleras: in the northern interior and Greenland it is less heavy.

Fauna and Flora.—The fauna of North America (Nearctic)

is more closely related to that of Europe-Asia (Palaearctic) than to that of any other zoogeographical province; the two areas are united by many writers in one province (Holarctic). The reindeer (caribou), beaver and polar bear are found in both; the moose, wapiti, bison and grizzly bear of North America are closely related to the elk, red deer or stag, bison, and brown bear of Eurasia; and the following groups are well represented in both provinces: cats, lynxes, weasels, bears, wolves, foxes, seals, hares, squirrels, marmots, lemmings, sheep and deer. The following forms are characteristic of North America: (rodents) pouched rats or pocket gophers, musk-rat, prairie dog, Canada porcupine; (carnivores) raccoon and skunk; (ungulates) musk-ox, big-horn, Rocky mountain goat, prong-horn; (marsupial) opossum. Among birds, there is a close resemblance to those of Eurasia, with some admixture of South American forms, such as humming-birds. Characteristic forms are the Baltimore oriole, bobolink, cowbird, flycatchers, wood-warblers, California quail, tree grouse, sage grouse, wild turkey and turkey buzzard. Turtles are especially numerous; salamanders are varied and large; rattlesnakes are among the reptiles.

The floral area of North America, defined by form and climate, may be divided into five belts: the eastern forested area, the western forested area, the interior unforested area, the northern barren lands and the torrid coasts. The eastern forested area extends from the Laurentian highland in Canada southward to the Gulf and Atlantic coast east of the Mississippi; in the north and southward along the mountains the trees are largely conifers with a mixture of birches, poplars and maples; southward, especially in the interior and at low levels, the conifers almost disappear and oaks, hickories, plane-trees, tuliptrees, walnuts and other valuable deciduous trees are in abundance; the long-leaf pine characterizes the low coastal margin. The western forested area begins in the Rocky mountains and extends to the Pacific, but does not descend below the lower timber line into the dry intermontane basins of middle latitudes; northward in Canada, the forest is continuous from the upper timber line down into the valleys; it attains a luxurious and dense development along the rainy coast, where the redwood (*Sequoia*) of northern California and Oregon reaches a height of from 300 to 400 ft. The unforested area of the interior includes two dissimilar regions. On the east are the fertile prairies, spreading between the middle Ohio and the upper Great Lakes and extending beyond the Mississippi; here the native grasses and herbaceous vegetation are now largely replaced by agricultural crops. On the west under a drier climate vegetation is more scanty; but far north a wooded belt connects the eastern and western forests across the medial plains. Aridity and barrenness increase southwestward into California and southward into Mexico; on this broad desert few trees are found, although piñons grow on cliffs and ledges and cottonwoods are found along watercourses; and the mountains that rise above the desert carry forests. The desert vegetation consists of cactus, agaves, sage-brush (*Artemisia*) and other dry-climate plants in large variety. In the far north are the "barren lands," with their permanently frozen subsoil; the growing season here is short and trees cannot develop, although birches, poplars, willows and some other kinds that attain good size southward are here present as dwarfed shrubs.

The torrid coasts support a tropical vegetation; it is somewhat developed in Florida and becomes dominant in Mexico and Central America. (W. M. D.; P. H. O.)

POPULATION

In the accompanying table are given the best available data with respect to the number of people in the major political divisions of North America and the islands in the Caribbean sea generally regarded as belonging to the continent. For continental United States and the U.S. possessions and for Mexico, the Central American countries, Haiti and the Dominican Republic there are available the returns of the 1950 census; and for Canada and the remaining smaller areas there are estimates for 1950 or 1949. From the figures in the fourth column of the table, which gives the population per square mile, it may be seen that some of the smaller islands of the West Indies are very densely populated indeed. Among the larger areas, Puerto Rico, with 645.8 persons per square mile, is the most densely populated. This figure is even more significant when it is realized that much of the interior of this island is steep and mountainous and ill adapted to agriculture, which is Puerto Rico's dominant industry, so that the population per square mile of crop land would amount to around 1,400. In the last column of the table is presented the population of the several areas around 1881, or nearly 70 years earlier than the dates represented by the later figures. During this 70-year period the population of the continent increased from 72,991,815 to 214,488,216, or almost three times.

Urban and Rural.—In the U.S., 64.0% of the 1950 population lived in urban areas, which, under a new definition adopted for the census of that year, comprised all cities and other incorporated places having 2,500 inhabitants or more, together with the thickly settled suburban area, or "urban fringe," around the larger cities, and those unincorporated places which had 2,500 inhabitants or more. In Canada, according to the 1941 census, 54.3% of the population was classified as urban, leaving 45.7% as rural. In Canada, the urban classification included all incorporated cities, towns and villages without regard to size, though the population of places having fewer than 1,000 inhabitants formed only a small part of the urban total. In the 1940 census of Mexico, 35.1% of the population was classified as urban, the urban population comprising all persons living in places (*localidades*) having 2,500 inhabitants or more. In Puerto Rico 40.5% of the population was urban in 1950; in Cuba, according to the census of 1943, 51.6%. In Guatemala, in 1940, the urban population formed 27.6% of the total; in Honduras in 1945, 29.0%; and in Panamá in 1940, 37.2%. Mexico City and Havana are the only large cities in the southern part of the North American area.

Racial Composition.—The base of the population of Mexico and Central America is Indian. In Mexico, for example, the census of 1930 reported, in round numbers, 2,444,000 whites; 4,621,000 Indians; and 9,181,000 of mixed blood, almost all white and Indian. (The 1940 census of Mexico made no classification by race.) Thus less than 15% of the population is locally considered white, and the percentage of pure white stock is probably much smaller. What is true of Mexico is true also of the Central American republics. Furthermore, in these the Indians and mixed stocks are being still further mixed by a considerable immigration of West Indian Negroes. In the West Indies there are great differences between one area and another, but the predominant stock in many of these islands is Negro, very generally mixed with white and in some cases with Indian stock. Even in Puerto Rico, the percentage of the population returned as white in the census (76.6% in 1940) is without doubt an overstatement, though the proportion of the inhabitants of Puerto Rico who do not manifest any of the characteristics usually associated with either Negro or Indian blood is considerable. In the United States, certain racial lines are closely drawn. Of the total population in 1940, 89.8% were white and 10.2% nonwhite, all except about one-twentieth of the nonwhites being Negroes.

In Canada, in 1941, Indians and Eskimos formed only 1.1% of the population and Asiatics only 0.6% and Negroes about 0.2% of the population.

The important distinction in Canada, however, is that between the French-speaking and the non-French, the French constituting 29.2% of the total in 1941, and in the province of Quebec, about 82%.

Thus Canada, unlike most other countries in North America, has no real colour problem, but only a language problem.

(L. E. T.)

ETHNOLOGY

The Indians of North, as of South, America are believed to have had their origin in the eastern hemisphere. In the new world there are no unquestioned fossils of human ancestors or extinct human races of markedly distinct type, such as Europe, Africa, Asia and Oceania contain. Also, most American archaeological sites contain artifacts of Neolithic as well as Palaeolithic type, in

Population of the Countries of North America, 1949–50 and 1880–82, with Area and Population per Square Mile

contrast with the thousands of pure Palaeolithic sites in the old world. Nevertheless, from about 1930, there were reported discoveries of chipped stone implements (Folsom type) in positive association with Pleistocene mammals now extinct (elephants, bison, horses, camels, sloths, etc.), with the result that man in America is now believed less recent than was the prevalent opinion formerly; some authorities allow him an age of 20,000 years, and most at least 10,000.

There is no reason to believe that the entry of man into America occurred as a single migration which was discontinued and never resumed. If one body of immigrants was able to find the way, it is almost certain that others would find it. The great speech diversification of America may have begun while the original speakers were still in the old world.

THE PEOPLING

It is practically certain that the peopling took place from Siberia via Bering strait, other land bridges to America being geologically too ancient to have served man. Bering strait is shallow, frozen over part of each year, less than 50 mi. wide, with the Diomede Islands near the middle. While probably never an insuperable obstacle even to primitive peoples, it never has been and is not now an easy means of communication, and the lands on both sides of it are inhospitable and capable of sustaining only a thin population.

The strait thus served much like a kinked tube. Man managed to filter through, and culture elements succeeded in being transmitted, but the flow of both was impeded.

There is no evidence that until the Russian occupation any advanced people ever occupied extreme northeastern Asia. Consequently, whatever accessions of inventions or other cultural materials reached the American Indians were of a type normally occurring among peoples of a relatively low level. Both in America and Asia the higher attainments of civilization occurred in latitudes not far from or below the Tropic of Cancer.

That the intercontinental connections occurred as just outlined is strongly suggested by ethnic conditions about Bering strait. The Eskimos on both sides of the strait are almost identical in physique, speech and customs; and farther back live Palaeo-Asiatic tribes (Chukchee, Koryak, Yukaghir) and American tribes (Dene, Tlingit, Haida) which resemble each other so definitely that some authorities have included the Palaeo-Asiatic ones with the Indians.

Race.—It follows that the racial origin of the American Indian has to be sought in Asia. The findings of anthropometry bear out the inference. The Indian belongs obviously to the Mongoloid division of the human species. He is brown skinned, with straight, stiff, black head hair, a minimum of beard and body hair, a definitely broad face (in popular parlance, high cheek bones) and moderate prognathism. These traits are constant among Indians, as among east Asiatics.

Minor peculiarities, such as shovel-shaped incisor teeth and bluish pigment spots in the sacral region during infancy, occur equally among the two populations.

The relations of the American Indian are, however, to the Mongoloid stock as a whole rather than to any one specific Mongolian people. They are probably closest to the east Siberians.

Although often called "red," the American Indians are so only when they paint themselves. Their general colour is a brown, little

if any darker than that of the Japanese. The tallest people are found in the centre of the continent in the Mississippi valley, and for some distance north and east. Along the Pacific coast and in Mexico, body heights are less. The Aztecs and Mayas were short peoples. Head form is about as variable as in the old world. In general, the cranial index is 79 or above (cephalic index 81+), except in six areas where it is less (longer heads): 1, the Eskimos of the Arctic coast; 2, 3, 4, in the east, from Cape Hatteras to St. Lawrence river; from the St. Lawrence north of the Great Lakes almost to the Rockies; an irregular tract in the Ohio and middle Mississippi valleys; 5, 6, on or near the Pacific coast, two intermittent tracts or chains of separated groups, between northern California and the tip of Baja California; from southern Arizona to central Mexico. In South America the long heads are almost all found in the eastern half of the continent, in or adjacent to Brazil. In both continents, ancient populations tend toward narrower heads than do modern populations.

The Eskimos (*q.v.*) are a well-marked sub-race. They are short, thick set, unusually long headed and broad faced, powerful jawed, narrow nosed, and with some tendency to the Mongolian eye. The remainder of the American race is difficult to sub-classify satisfactorily. Ales Hrdlicka distinguishes three types, of which he considers all existing populations in North and South America to be either representatives or mixtures. These are: 1, tall and broad headed; 2, long headed, mostly tall; 3, broad headed, stature moderate to short. The more advanced peoples from Mexico to Peru are assigned to this third type.

Language.—The outstanding characteristic of native American speech is its diversity. According to the older reckoning there were more stocks of languages in either North or South America than in the entire eastern hemisphere—about 75 on each continent. Recent researches have moved in the direction of uncovering similarities between some of these stocks, thereby reducing their number. There is little indication of borrowing between languages, except in South America.

The older view that American languages are overwhelmingly agglutinating, incorporating or polysynthetic, can no longer be maintained. There are languages as genuinely inflectional (Penutian) and isolating (Otomi, Zapotec) as in the old world. It is, however, true that the Indian languages tend to describe concretely and visually. Elements expressing the instrument or manner of action, the shape or position, and space relations, although by no means universal, are frequently well developed in the grammatical structure. It is also true that many of the idioms do not shrink from piling up structural elements into long words.

The most important linguistic stocks north of Costa Rica, in point of number of speakers or territory, are Eskimo, Athabascan, Algonkin, Iroquoian, Siouan, Muskogi, Caddoan, Uto-Aztecan, Salish, Sahaptin, Penutian, Hokan, Tarascan, Otomi, Zapotecan, Mixe-Zoque, Maya, Totonac. Of secondary rank are Tlingit and Haida (with Athabascan = Na-Dene?), Tsimshian, Wakashan (*see* KWAKIUTL and NUTKA), Chinook, Kootenay, three Pueblo stocks (Tanoan, Keres, Zuñi), Kiowa (with Tanoan?), Tonkawa, Natchez (probably with Muskogi), Yuchi, Beothuk (*see* also INDIAN, NORTH AMERICAN).

Culture.—The culture of the American Indians, like that of any large group, is so complex that a descriptive review is inadequate in proportion as it is compact. This culture is therefore perhaps best considered from the point of view of how its constituents classify as to origin—elements common to America and the old world, peculiar to America, important in the old world but lacking in the new, etc.

1. A series of simple culture traits are literally (or practically) universal among American tribes and of equally common occurrence in the old world, and may be assumed to have formed part of the culture stock with which the first immigrants came into the hemisphere. These traits include the use of fire and the ability to make fire with the drill; the dog as a domesticated or semi-domesticated animal; stone implements for piercing, cutting, scraping, chopping; the spear, the spear-thrower, and perhaps the harpoon and simple bow; cordage, netting and basketry; crisis rites and shamanistic beliefs and practices. These elements survive in the more remote and backward portions of the eastern hemisphere, and for the most part have their relative antiquity attested directly by archaeology, carrying back to the end of the Palaeolithic or beginning of the Neolithic period.

2. Equally well defined is a class of culture traits which are widespread in the eastern hemisphere, in fact practically universal in all parts possessing a sufficient development, but are totally lacking in both North and South America. These elements evidently originated in the old world subsequent to the movement which mainly populated America; they were not for some reason, perhaps chiefly because of the inhospitable conditions and backwardness of culture in the region of Bering sea, diffused into America. This class of traits includes all the important domesticated animals and plants of the old world excepting the dog, viz., cattle, sheep, the goat, pig, horse, ass, camel and even reindeer; wheat, barley, rice, etc.; the plough and the wheel; iron; stringed instruments; proverbs. Environment may be held responsible for the absence of some of these from the western hemisphere; it cannot account for the non-existence of the last four or five.

3. The higher civilizations of America were reared on an economic and technological foundation of their own, evidently evolved in and largely remaining confined to the region of "Middle America," namely the area from Mexico to Peru. The basis of this civilization was a form of agriculture limited to a series of indigenous plants. Fundamental among these plants was maize, whose wild ancestor, or hybridizing ancestors, and place of origin, remain a puzzle to botanists. Closely associated with maize were true beans (*Phaseolus*) and squashes. These plants were cultivated by nearly all Indians of both Americas as far as agriculture was practised by them at all, from the St. Lawrence to the La Plata. In the tropical region there were cultivated in addition other important plants—the potato, sweet potato, manioc, tomato, pineapple, chili pepper, tobacco, chocolate, etc. All this agriculture was practised without implements more complicated than a hoe or simple planting stick; it was strictly a hand culture. Domesticated animals were lacking, except for the llama and alpaca in Peru and the turkey in Mexico. Copper, gold, silver, tin and lead were smelted, cast, plated and alloyed in Middle America; in other words, metallurgy comparable to that of the old world prior to the iron age was known. Cotton, of another species than the cotton of the old world, had been domesticated in Middle America and was the basis of an elaborate textile art, operating, however, with simple apparatus; and clothing was of types based upon true fabrics instead of skins or bast fibres. Pottery shows a wide distribution almost identical with that of agriculture; archaeologically, it is generally associated with agricultural remains; and it may therefore be assumed to have originated in Middle America at about the same time as agriculture. Masonry had spread somewhat beyond the cultural nucleus of Middle America, as far as northwestern Argentina and southwestern United States.

Middle America was a region of towns, therefore of higher political organization, and in Mexico and Peru of considerable empires. In the same regions ritualistic religion, including altars, permanent edifices, sacrifices and symbolism, reached its most complex development. This development was evidently dependent upon the existence of a priesthood persisting through successive generations under stable social and political conditions. Finally, the intellectual achievements, probably also in large part due to priests, culminated in the mathematical and calendrical systems of the Maya, and in an incipient system of writing employed by them and the neighbouring Mexican nations. Attempts have been made to derive these products of learning from the old world; but analysis shows their principles, especially those of the calendar, to be unique. The Maya, for instance, had devised position numerals and a sign for zero; but their system of numeration was vigesimal, and they were probably using this system before any people in the old world had invented a sign for zero.

4. Other culture traits in America, not specially characteristic of higher civilization, do not occur regularly distributed in or around the Mexican-Peruvian area. Some of these traits may be presumed as due to local inventions independent of the Middle

American stimulus. Others may have originated earlier than the Middle American agriculture-metal-town-priesthood growth and have diffused irregularly, or perpetuated themselves only in certain tracts. Most elements peculiar to one or two culture areas fall into the present class; for instance, the carpentering, wood-carving and frame houses of the North Pacific coast; the special war customs of the eastern United States; the acorn food technique of California. Clan systems or exogamic institutions, usually with totemic manifestations, occur in North America in several areas: the southeast and northeast, the North Pacific coast, in a limited area in the plains, and in the southwestern United States.

5. A certain number of traits restricted to the northwestern half of North America show modern or recent analogues in the old world, usually in northern Asia and Europe, but do not appear to possess extreme antiquity. They may therefore be assumed as importations into America, mainly by diffusion rather than by migration, in the last few thousand years. For the most part these traits are distinguishable without difficulty from the universal and supposedly very ancient ones of class 1. Into the present group there may fall the sinew-backed bow (the American equivalent of the composite bow of Asia), the tepee or skin tent on poles, the snow-shoe and toboggan (equivalent of old world snow-shoe of ski type), birch bark canoes and vessels, the half-underground house roofed with earth, tailored or fitted clothing of sewn skins, and several myth episodes such as "Earth Diving" and the "Magic Flight." The distribution of most of these traits in America stops before it reaches the southwest and southeast United States. None of them had reached the advanced portions of Mexico.

Culture Types.—An attempt has been made by Americanists to organize the complex and irregular manifestations of native culture by classifying them into certain types characteristic of regions known as culture areas. These are to a certain degree environmental; the natural environment is thought to have acted as a stabilizing and perpetuating factor, once a certain type of culture had been achieved in an area. Essentially, however, this classification is one of culture types, and the concordant geographical areas largely represent empirical determinations of distribution. In this respect the culture area classification, as first formulated by Wissler and accepted with only minor modifications by practically all American students, differs from older attempts which proceeded from environment as the supposed determinative factor. The more important types of culture in these areas are outlined in separate articles. The areas are: 1, Mexican, north about as far as the Tropic of Cancer (*see* AZTEC, TOLTEC, ZAPOTEC); 2, Southwest (*i.e.*, of the United States, but including northern Mexico; *see* PUEBLO); 3, 4, Southeast and Northeast, perhaps to be joined and called Eastern woodland (*see* MUSKOGIAN INDIANS, MOUND-BUILDERS, IROQUOIS); 5, Plains (*q.v.*), in the untimbered centre of the continent; 6, Plateau, in the western intermountain region, an area relatively undifferentiated in culture, with actively entering influences from the adjacent areas (the Great Basin is sometimes separated from the upper Columbia and Frazer region and united with California); 7, California; 8, North Pacific coast (*q.v.*), from northern California to southern Alaska inclusive; 9, Mackenzie-Yukon (*see* ATHABASCAN); 10, Arctic (*see* ESKIMOS). The West Indies seem to belong culturally with South rather than with North America. The southern frontier of the Mexican area may be placed at southern Nicaragua—Costa Rica and Panamá forming part of the Chiboha or Colombian area of South America.

Qualitatively, these areal types are not equivalent but of quite different intensity and historic depth. The Southeast has been influenced by Mexico, and has in turn influenced the Northeast and Plains. The Southwest represents a second and largely distinct centre of derivation from Mexico. The North Pacific Coast has perhaps adopted more cultural material of Asiatic than of Mexican origin, and has reworked it all with considerable originality. On the technological side alone, the same may be said of the Eskimo. California, Plateau, Mackenzie-Yukon are intermediate areas of rather indifferent characterization.

Temperament.—This is notoriously difficult to dissociate from culture habits, but there appears to be a fairly general agreement as to a characteristic American type of mind and personality, though it might be arguable how far this is innate. Almost universally the American Indian is reserved, stoic, enduring and unresponsive, the antithesis of the Negro, and more similar to the Mongolian in behaviour than to the Caucasian. He is not without humour, but holds expressions of it in rigorous check, so that it becomes manifest chiefly in intimacy. He is patient but not quick; tough in adversity but unenterprising; stable but unimaginative; cruel when his inhibitions have been removed, but not given to brutality ordinarily. He prizes control as the highest virtue, and restraint and decorum as the essentials of manners, and therefore almost always impresses as imbued with unusual sense of respect of personality.

Population.—The original numbers of the American Indians are imperfectly known. The most complete and careful count, that by Mooney (*Smithsonian Misc. Coll.*, lxxx, 1928) arrives at a total of 1,150,000 souls north of Mexico at the time of first contact with Europeans. Inasmuch as several specialists have set a somewhat lower figure for the regions with which they were most familiar, Mooney's total is probably too large rather than too small, and one million in the United States and Canada was, perhaps, not far from the true number. In Mexico and in Central America population was much denser relatively and absolutely; it cannot well be put at less than three to four million, and has generally been estimated as several times greater than that. Similar conditions prevailed in South America: there may have been nearly as many natives under Inca rule as in the remainder of the continent.

In general, the race has declined after contact with Europeans. Some North American tribes have become completely extinct. Some have shrunk, lost their identity and merged. Some have more or less held their own, and a few, like the Navaho, have increased markedly. In the United States, most tribes began to increase again by 1910.

In many tribes there has been an infusion of white and sometimes of Negro blood. Except in the Southwest, it may be said that even those tribes that remain as numerous as originally, are so through the inclusion of alien blood. Socially the mixed bloods generally are Indians. Of this population of pure and mixed blood, there remains not quite half a million in the United States and Canada. Mexico is estimated to be about one-third pure Indian, and more than another third, part Indian. Guatemala is mostly Indian.

History.—There is no native documented history of the American Indian, except for the Mexicans and Maya. The great bulk of the tribes had neither time systems nor writing, and left only legendary traditions. These usually possess limited authenticity. In the main the history of the tribes is a history of their contacts with Caucasians. Often more can be gathered as to the movements or former fortunes of a stock, from its recent distribution and from the relations of its component languages, than from any directly historical source.

(*See* ATHABASCAN, UTO-AZTECAN FAMILY, ALGONKIN, SIOUAN INDIANS, MUSKOGIAN INDIANS, IROQUOIS.)

Native history resting on a documentary basis has been preserved only in the Mexican region. The Maya left both monuments with dated inscriptions and post-Spanish chronicles. The calendar (*q.v.*) in which the inscriptions are expressed is extremely accurate and is well understood, but its conversion into our chronology is still controversial. According to the correlation formerly accepted by most specialists, the Maya cities of the Great period, which have left the principal dated inscriptions, flourished from the 1st to the end of the 6th century after Christ. The present tendency is to construe the time as 260 years later: from the 4th to the 9th century. This calendar system involves long observation, some astronomical knowledge, considerable facility in computing, and is accompanied by hieroglyphic writing, fine sculpture, and advanced architecture. Beyond this was a formative period on which information is accumulating.

An Archaic period is well known from remains in and around

the valley of Mexico. This, however, was a culture already emerged from primitiveness, since the first of its several stages possessed agriculture and pottery. For this reason some now name it the Middle culture. Its beginnings seem coeval with the Maya formative period. The Archaic was succeeded by the more advanced culture of the Toltecs (Teotihuacan), and on this legendary data were preserved by the historic Aztecs, Mixtecs, etc. Some of these accounts are chronological and carry Toltec history back to about A.D. 600. The Toltec-Aztec calendar, however, while accurate within its cycles of 52 years, did not with certainty distinguish successive cycles, so that most Mexican dates must be accepted as only approximations.

In the southwestern U.S., Pueblo and pre-Pueblo culture has been unravelled by intensive archaeological work, until a series of seven stages is known, the first being without pottery and dated by dendrochronology (tree rings) to the 3rd century A.D. The Hohokam culture of S. Arizona is as old and may be older.

BIBLIOGRAPHY.—The most important general work of reference is the *Handbook of American Indians,* published by the Bureau of American Ethnology as Bulletin 30 in two parts (1907 and 1910). The basic work on linguistic classification is by Powell, *7th Report of the Bureau of American Ethnology* (1891). As regards culture, the points of view here adhered to were first outlined by Boas in a brief article, "The History of the American Race" (*N.Y. Acad. Sci.,* xxi, 1912); supplemented in the *Intern. Congr. Americanists,* xxi (Göteborg, 1925); and are most fully developed, with special emphasis on the culture areas and with attention also to racial and linguistic factors, in Wissler, *The American Indian* (1917; 3rd ed., 1938). Brief comprehensive works on special areas are Goddard, *Indians of the South-west, Indians of the North-west;* Wissler, *Indians of the Plains;* Spinden, *Ancient Civilizations of Mexico* (these four are *Handbooks* of the American Museum of Natural History) Kroeber, *Handbook of the Indians of California,* Bur. Amer. Ethn. Bull. 78; Kidder, *South-western Archaeology* (1924). Numerous monographs and special articles are cited in the bibliographies included in these general works. (A. L. K.; X.)

ARCHAEOLOGY

The discoveries of Palaeolithic man in Europe stimulated activities to discover similar evidence in the new world. Laymen and scientists expected to find comparable associations and closely related types of primitive man. During the close of the 19th century and the beginning of the 20th century a lack of sound criteria as well as over-enthusiasm on the part of many investigators created numerous erroneous conclusions. Many reputed discoveries of Palaeolithic man in America, when critically examined on a strictly scientific basis of direct association, did not satisfy the open-minded scientist.

Improved archaeological techniques, more careful observations and the accurate recording of information have provided the evidence of direct association between man-made objects, such as chipped arrow and spear points, gravers, knives and other tools, and the now extinct forms of mammoth, mastodon, bison, camel, horse and other animals.

The objects recovered by these more carefully controlled archaeological methods and the close co-operation between specialists of related sciences, such as Pleistocene geologists and palaeontologists, have produced the basic evidence required. This evidence consists of man-made stone tools and fire hearths in identifiable geologic strata, comparable tools in direct association with now extinct animals, camp site refuse on old land terraces and the shores of old beach lines.

The most generally accepted archaeological complex which has provided the evidence of ancient man in North America is known as the Folsom complex. The name "Folsom" has been given to this horizon because the first occurrence of extinct animals associated with finely chipped projectile points was discovered in a bone deposit on the upper sources of the Cimarron river near the town of Folsom, in eastern New Mexico. This bone deposit, consisting of articulated skeletons of extinct bison and a large deer-like animal, was discovered in 1925. During the next three years palaeontologists and archaeologists worked together in the excavation of the site and recovered numerous flint projectile points, characteristically chipped, in direct contact with the skeletons of the extinct forms of bison. In 1932 a similar characteristic Folsom point was found in conjunction with a few bones of a musk-ox-like animal eight feet beneath the surface of a cave deposit in the Guadalupe mountains in southeastern New Mexico. This association was several feet beneath a stratum of cultural material identified as a Basket Maker cultural-pattern, the oldest cultural level then known in the Pueblo area of the American Southwest. The three major sites producing specific Palaeo-Indian evidence are: (1) the original Folsom site; (2) along Black Water draw between Clovis and Portales in central-eastern New Mexico; (3) the Lindenmeier Ranch north of Fort Collins in the northeast corner of Colorado. There are other sporadic sites throughout the central plains east of the Rocky mountains, extending from Texas north into Canada, which have produced the association between these characteristic fluted points and mammoth or extinct bison bones.

There are two types of flint implements which are distinct and quite characteristic of this archaeological horizon: (1) a relatively small projectile point; (2) a larger knife-like specimen. Both of these forms have a longitudinal groove or channel on both faces extending from the base for two-thirds the length of the implement. In cross-section they have a biconcave appearance. The form is somewhat leaf-shaped with a concave base, and on the smaller points the tip is stubby. Along the edges of the blades and between them and the parallel ridges, formed by the removal of the central flake, is a fine marginal edge formed by the removal of small flakes. These points were extremely well made before the central flakes were removed, as indicated by the finding of the original lateral flakes which showed the primary flaking grooves. The exact purpose of the lateral grooves which characterize these specimens is not known. Such a form may have simplified the hafting of the point to the shaft of spear or arrow; it may have reduced the weight; enabled the shaft to be removed while the point remained in the animal to promote bleeding. The few perfect points that have been recovered represent some of the finest examples of aboriginal chipping techniques in North America.

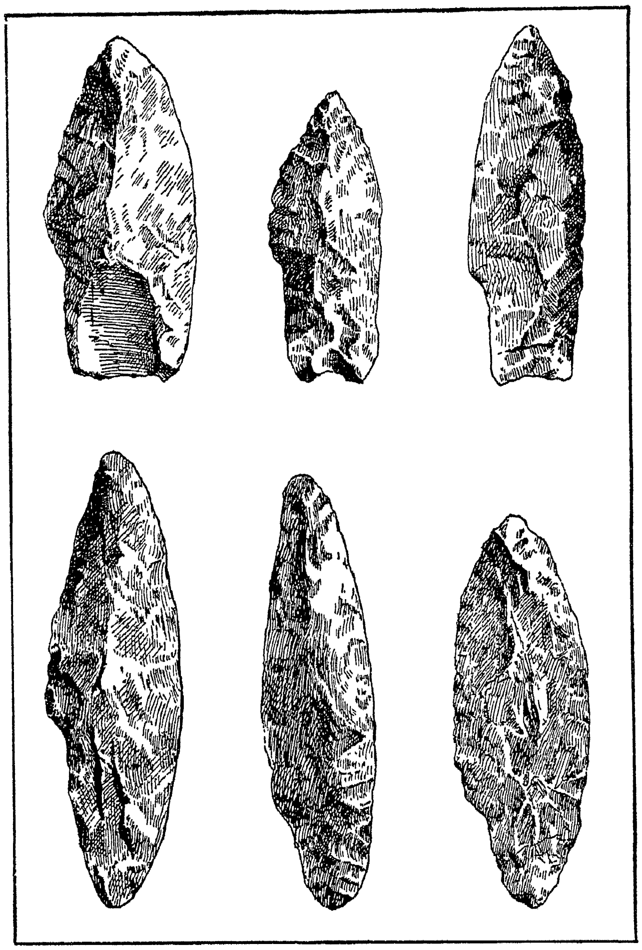
TYPES OF FOLSOM POINTS AND CROSS-SECTIONS ILLUSTRATING THE CHARACTERISTIC LONGITUDINAL GROOVE

In the stratified deposit of a cave high up in Las Huertas canyon in the north end of the Sandia mountains, east of Albuquerque, New Mexico, a group of artifacts was recovered beneath a Folsom deposit. This is the first and only site providing unquestionable proof of a period antedating the Folsom horizon. The archaeological results obtained at Sandia cave are of major importance. Three distinct cultural levels were recovered.

Pottery fragments comparable to those from pueblos inhabited prior to the Spanish explorations were found near the mouth of the cave. Under this more or less recent deposit extended a sheet of travertine representing roughly the end of the Pleistocene geological period in this section of North America. Beneath this hard crust classic Folsom points, large blades, gravers, scrapers, an ivory shaft and worked splinters of bone, together with fragmentary bones of the mammoth, bison, camel, horse and ground

sloth were recovered. Below this Folsom layer was found a sterile laminated stratum of yellow ochre. Under the yellow ochre the collection of Sandia material was found. This, the oldest level of



BY COURTESY OF SMITHSONIAN INSTITUTION

CHARACTERISTIC PROJECTILE POINTS FROM THE LOWEST LEVEL IN THE SANDIA CAVF

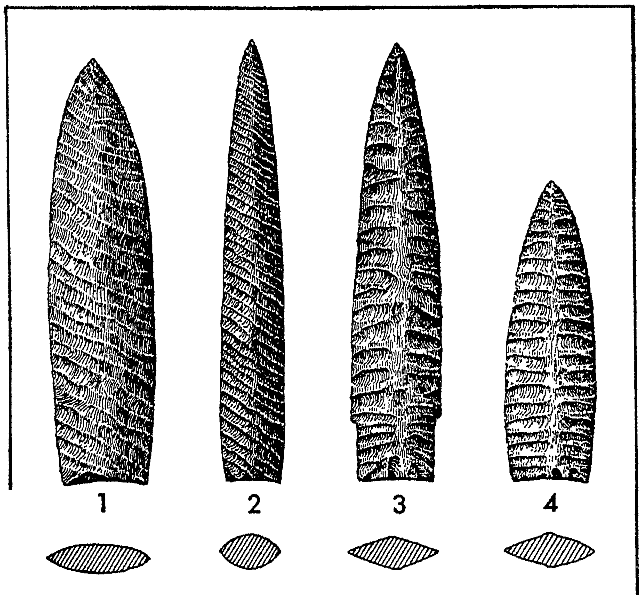
occupation, contained a distinctive type of chipped point which is larger than the Folsom type and not as well chipped. The points are characterized by a side shoulder or notch which is somewhat comparable to a Solutrian type. Some of the points are lanceolate in shape, others are straight shafted with paralleling sides. Snub-nosed and side scrapers, numerous flakes and bone points were also found in this layer. The animal bones identified are similar to those found in the Folsom stratum with the addition of bones from a mastodon. Evidence of ground sloth was found in the Folsom layer as well as in the most recent deposit, which would indicate the ground sloth to be one of the last survivors of the many large mammals belonging to the Pleistocene fauna.

In Yuma county, Colorado, relatively long, well-chipped spear points or knives were found associated with some Folsom points. These long slender blades, oval or diamond-shaped in cross-section, have been considered by some authorities as being contemporaneous with the Folsom remains. Others believe that they represent a later group of people although they have been found in association with some of the most recent Pleistocene mammals. They no doubt represent the work of nomadic hunters living on the North American continent at the very end of the glacial period and continuing after the Folsom horizon. The major concentration of this type of projectile seems to extend across the western plains from Alaska to Texas.

Except for the Sandia horizon there are many Folsom and Yuma sites throughout the central and western portions of the United States, ranging from sporadic discoveries on the surface to those providing direct association between the characteristically chipped points and now extinct animals. In none of the more important sites has there been any direct association between these projectiles and human skeletal material. Therefore, all conclusions have been based on the geological strata and the recurring fauna. On the basis of the geology and archaeology it is safe to assume that these sites represent the first and oldest evidence of man in the western hemisphere. Even though no direct association of human skeletal material has yet been recovered, most authorities agree that it represents an essentially modern type of American Indian arriving in the new world about 15,000 years ago with a stone culture somewhat comparable to the Early Neolithic in Europe. On the basis of this evidence a considerable hiatus exists between this Palaeo-Indian horizon and the oldest remains of the subsequent Indian tribes, whose earliest remains rarely precede the beginning of the Christian era. A broad interpretation of the factors governing such a long separation, of at least 10,000 years, is that the first migrants, after crossing Bering sea into Alaska, came down the eastern corridor shortly after the receding of the northern glaciers. Minor oscillation of subsequent ice sheets may have discouraged or prevented human migrations until a much later date. Other barriers may have prevented a continuous migration from the northern Asiatic mainland. A better understanding of the geology together with additional explorations may provide the necessary information relating to this most interesting problem of the Palaeo-Indian in America.

As indicated in the foregoing section, one of the most interesting problems for future research is a sound explanation of the hiatus of 10,000 years which now seems to exist between the remains of the Palaeo-Indian horizon and the basic cultures of the ancestors of the historically known American Indians. When written records were not left by the vanished peoples, as is the case in most of North America and in many other regions of the world, there must always be a considerable element of speculation regarding major archaeological monuments, though the basic facts may be ascertained with more or less clarity.

After 1930 modern archaeological techniques, the analysis of tree rings, as well as the concentration on historical problems, reduced the time elements formerly considered essential in the evolution and development of the prehistoric Indian cultures. Generally speaking, the ecology of various areas in the United States and the adjustments made by the aborigines to these local regions have played an important role in the various archaeological manifestations thus far recovered. For the sake of brevity and



BY COURTESY OF SMITHSONIAN INSTITUTION

YUMA POINTS ILLUSTRATING OBLIQUE CHIPPING

clarity the various archaeological horizons will be considered in the following arbitrary areas: Alaska, Northwest Coast, Intermontane, the Southwest, the Mississippi Valley, the Great Plains and the North Atlantic.

ALASKA

In the Alaskan area, in contrast with some of the others to be considered, we are not confronted with the problem of major shifts in the population nor profound changes in culture caused by environmental factors. The local, somewhat limited, fauna is practically identical to that existing in prehistoric times. No other part of the continent presents such a clear picture of a modern culture derived from a prehistoric pattern as do some of the sites in Alaska and Greenland. Many important sites have been abandoned for centuries while others are still occupied by the descendants of the prehistoric Eskimos. On Little Diomede Island, halfway between Asia and America in the Bering strait, the modern Eskimo houses are built on top of the old midden and the present population continues to add evidence of their handiwork and discarded material to the mass of refuse that has been accumulating for the past 2,000 years.

The permanently frozen soil has preserved a remarkably full and detailed picture of life and the objects used by the aborigines. Implements, weapons, ornaments and utensils exist in large quantities and provide the archaeologist with the necessary data for reconstructing the life of these people.

Thus far the real origins of the Eskimo culture have not as yet been fully established. No trace of a pre-Eskimo population has been found. Nevertheless, Palaeo-Indian migrations must have used the Bering strait corridor in order to reach the new world. These original migrations developed no doubt as a result of following the herds of land mammals upon which ancient man depended for his livelihood.

Archaeological excavations in Alaska have disproved the theory that the more ancient the artifacts the more simple their design elements. The excavations within the Bering strait region have indicated a long series of cultural changes in the direction of simplification rather than progressively complex. From the point of view of decorative motifs the Old Bering Sea culture is much more advanced than that of the present-day Alaskan Eskimo. In southern Alaska, on the other hand, the oldest level at Kachemak bay is a more simple generalized Eskimo character in contrast with the more recent stages, largely the result of the influence of the northwest coast Indians.

Several archaeological horizons have been established in Alaska. Starting with the oldest remains, which have been dated around the beginning of the Christian era, there is the Old Bering Sea culture from excavated sites on St. Lawrence Island, the Diomede and Prince of Wales Island, and postulated for the region around Point Barrow. In southern Alaska a contemporaneous group has been called Kachemak Bay. In the central area and extending east as far as Greenland are cultures derived from ancient manifestations known as the Dorset culture.

The lack of concentrated archaeological excavations in northeastern Asia has been largely responsible for the lack of comparative material from such Asiatic coast sites. In 1939 and 1940 a site was discovered at Point Hope in northwest Alaska which has produced strange and highly conventionalized examples of carvings on ivory which do not resemble comparable material from other sites in the Eskimo region. This site consisted of hundreds of house ruins, none of which was superimposed, which would seem to indicate simultaneous occupancy by several thousand people. If this surmise is correct it would represent one of the most concentrated settlements in prehistoric times. Ipiutak, the name given to the site, produced a preponderance of chipped flint arrowpoints, knives and scrapers, and lacked many implements typical of the other prehistoric Eskimo cultures. They may have been an inland people, dependent on land mammals, who concentrated at such a coast site for a limited period in the spring for the hunting of such sea mammals as the walrus and seal. The 4,000 artifacts from this site are made from ivory, bone, antler and flint. One of the most striking differences between the collections from Ipiutak and other Eskimo sites is the lack of harpoon heads and the presence of many hundreds of arrowheads. There was also a group of 150 fantastic ivory objects whose use was impossible to classify immediately.

It would seem from the above description, and based on the tentative conclusion, that Ipiutak is the oldest of the Eskimo cultures; that the farther the past is penetrated the more complex are the ivory carvings. Future excavations in the Amur regions and other sections of northeastern Asia may produce comparable traits. Eskimo culture as it is known today may be an adaptation to the rigorous arctic coast by people from southern latitudes in eastern Asia.

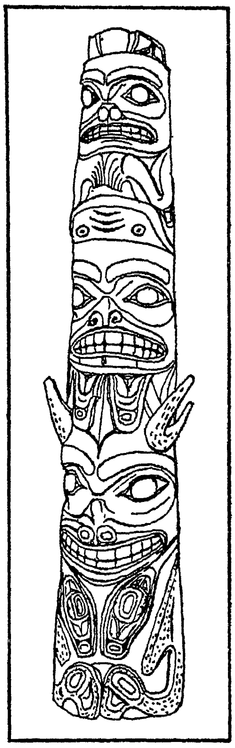
In southern Alaska, the Aleutian Islands, Kodiak Island and Cook inlet there is a more or less generalized Eskimo culture. In only a few cases are there any specific resemblances to the northern or Bering strait types. These few examples, however, would seem to indicate an ancient Eskimo stratum which became isolated and permitted the growth of a specialized form of culture in south Alaska. At a later period these people were subjected to strong Indian influences from the northwest coast.

The great number of kitchen middens or shell heaps, some attaining 20 ft. in height, throughout the Aleutian chain of islands is sufficient proof that these islands and the adjacent Alaskan coast line were as densely populated in prehistoric times as they were when explored by the Russians in the 18th century. The material culture from the sites in this general region consists of stone lamps, elaborate barbed bone points, compound fishhooks, awls, needle cases, needles, wedges, labrets, pendants, spoons, harpoon heads, foreshafts, drill points, chipped stone, rubbed slate knives and whetstones. Excavations on Kodiak Island produced skeletal evidence showing that the skulls from the lower levels are longer and higher (Eskimoid) as in contrast with the more modern Aleuts, which are extremely low and broad.

In the later stages of the culture, possibly in the 13th and 14th centuries, the Indian cultures farther south, along the northwest coast, greatly influenced this Eskimoid pattern by the introduction of such customs as disarticulated burials, the gathering of trophy heads, the use of human bones, and by the introduction of such specimens as the pestle, copper ornaments, elaborate stone lamps, nose pins, slate mirrors, stone clubs and the splitting adze. Environmental factors no doubt led to the adoption of many traits from the more highly developed social groups to the south.

NORTHWEST COAST

This comprises a coastal area ranging northward from Oregon to the Alaskan peninsula. The exceptional fauna and flora of this territory together with the peculiar geographical conditions influenced a specialized type of food-gathering culture. So far very little archaeological research has been made, and for this reason it is not possible to determine any contrast between the culture of the highly organized Indian tribes of the 18th century and their antecedents. Except for a few minor objects there seems to be very little influence from the Eskimo to the north. Certain traits, such as slat or rod armour, woven hats, grave monuments, bark beaters, and edged clubs are comparable to similar forms in southeastern Asia and parts of Oceania. Whether these objects reached the coast by direct contact or the accidental shipwreck caused by ocean currents has not been definitely determined. The similarities between the northwest coast and the Asiatic mainland west of the Aleutian Islands, as found among the Kamchadal-Koryak groups, may be the result of relatively recent contacts from east to west across the Aleutian Islands.



FROM A. L. KROEBER AND T. T. WATERMAN, "SOURCE BOOK IN ANTHROPOLOGY" (UNIVERSITY OF CALIFORNIA PRESS)

MODEL OF A TOTEM POLE FROM THE HAIDA INDIANS LIVING IN THE NORTHWEST COAST AREA

The material culture of the historic Indian tribes inhabiting this unusual coastal strip and the adjacent islands represents one of the outstanding aboriginal cultures on the American continent. This is especially noteworthy of a seminomadic group of people where agriculture was unknown. The ecological factors of the territory together with the aggressive and vigorous nature of the inhabitants are largely responsible for such a development. Because of the splendid forests the people developed great skill in the carving of wooden monuments, such as the totem poles, decorating their houses and implements, and in the manufacture of their world renowned dugout canoes from the giant cedar trees. Their aesthetic ability is also shown by their works of art in shell, ivory, stone, bone, horn and copper. The stone objects consisted of mauls, hammers, clubs, pipes, pestles and mortars, knives and chisels. The chipped stone objects are rare in the northern sections but more common to the south. Wooden, bone and horn vessels took the place of pottery. Even though copper occurs in easily mined surface deposits it is unknown as to whether this medium was used in prehistoric times. In historic times conventionalized copper plates served as important exchange items together with their beautifully woven goat hair blankets during their highly ceremonialized potlatch.

Many tribal variations are found based on the foregoing material culture. In the north were the Tlingit, Haida and Tsimshian; in the central area were the Kwakiutl and Bellacoola; in the south the Salish, Nootka, Chinook and some Athapascan tribes. The staple food

was that derived from fish and sea mammals and some hunting on the mainland, and there was dependence on the varieties of berries and plants. They cooked their food in the beautifully carved wooden boxes by heating the liquid with hot stones; lived in rectangular gabled houses of upright cedar planks, and travelled chiefly by water in their large artistically painted sea-going canoes. Their social organization consisted of matrilineal descent and was organized into a definite class system of chiefs, nobles, commoners and slaves. Their mythology was characterized by Raven legends.

THE INTERMONTANE

This area, sometimes referred to as the Great Basin, covers the southeastern part of Oregon, southern Idaho, Nevada, Utah and the eastern part of California. The natural environment at the close of the Pleistocene geological period became one vast desert with a rugged topography, all of which limited any horticultural activities except in a few restricted parts of the Colorado river valley and in the piedmont area of the Wasatch mountains. The deep valleys and high mountain ranges discouraged communication and infiltration from neighbouring culture areas. The scant vegetation restricted the survival of any herds of large animals. Mountain sheep and deer lived in the mountains, while a few antelope occurred in the valleys. Special techniques were required for the trapping of smaller mammals. Such limited natural resources formed a distinct barrier to a concentration of people. It is roughly estimated that from 30–35 sq.mi. of land was required to support one person.

Even though the Intermontane extends as far east as the Rocky mountains, the cultural remnants thus far recovered are associated with those from the west and south. The archaeological cultures reported from this area seem to cover a considerable period of antiquity, ranging from the close of the Pleistocene period at such sites as Gypsum cave in Nevada, remnants of early cultures along ancient stream and lake shores in southeastern California, through the Anasazi influences from northern New Mexico, Arizona and southern Colorado, to the historic Shoshonean Indian tribes.

During the close of the Pleistocene period or during the glacial age the Great Basin area was probably much more fertile than at the present time. Prehistoric man with his simple equipment would have found sufficient game to exist in considerable numbers. Except for those sporadic finds, such as at Gypsum cave and Lake Mohave to the south, no specific evidence has been found of glacial age man. After the continental glaciers receded the present semi-desert environment vastly changed the flora and fauna. The available natural food supply after the beginning of the Christian era consisted of seeds, rodents and fish in restricted localities. To exist under these limited conditions would require a culture possessing a basketry complex, the metate for the grinding of seeds and nuts, traps, nets, snares, the bow and arrow or spear for the limited hunting and fishing, and methods for transporting and storing water. During the development of the classical Basket Maker period in the archaeological area known as the Southwest, the fundamental traits required to maintain a livelihood in this semi-desert environment were developed and permitted population expansion and direct migration. Those traits of a Basket Maker origin which were carried into the Great Basin area were sandals, skin blankets of twisted animal fur, curved wooden clubs known as rabbit sticks, and the metate for pulverizing nuts. Other phases of the Basin culture may have spread from the west or north, such as the nets, snares, traps, bow and arrow. Many of these traits spread slowly within the Great Basin by the ancestors of the historic Shoshoneans. Before these ancestors spread this predominantly Basket culture to the eastern sections of the Basin a new and more highly developed Pueblo culture invaded the eastern sections. Evidence of this pottery-making culture spread throughout northern Utah and eastern Nevada. These pottery-making peoples did not remain for many years, and after their return to the Southwest the ancestral Shoshoneans expanded throughout the territory. After this settlement congealed the Shoshoneans borrowed salmon-fishing techniques from their northern neighbours, twined basketry from the west, pottery from the south and east, skin garments and moccasins and later the horse from the Plains Indians east of the Rocky mountains.

THE SOUTHWEST

This important archaeological area—where diverse prehistoric peoples overcame a rigorous semi-desert environment to become sedentary, establishing large apartment-like dwellings, with a communal society directed by native priests within an elaborate framework of ritualism —is located within the states of New Mexico, Arizona, southwestern Colorado, southern Utah, eastern Nevada and northern Chihuahua and Sonora. This area has been roughly divided into two distinct categories. The northern cultures have been grouped under a single term, "Anasazi," a Navaho word meaning "the ancient ones," while those cultures to the south, along the Gila and Salt rivers, have been designated by a word from the Pima tradition for those who departed long ago, "Hohokam." Archaeological investigations throughout the Southwest have been based on a true historical perspective by the use of the stratigraphic method. This method is comparable to that used by the geologists and palaeontologists in reconstructing the history of the earth and the animals that lived upon it. The seriation of European cultures from the Palaeolithic period to the beginning of historical records has been established through the same sound approach. In any undisturbed deposit of geological or human character formed over a considerable portion of time, the oldest material is found at the bottom of the deposit and the most recent material on the top, while those strata or layers in between the top and bottom are of an intermediate age.

The evidence obtained from pure stratigraphical studies gives a relative position for the early and late material. Due to conditions of an arid climate in the Southwest, many perishable objects such as wooden roof beams were preserved for many centuries. Such a climate with its radical wet and dry years influenced the growth of trees in a manner affecting the growth rings of the trees. To the archaeologist relative dating based on actual stratigraphy was vitally important, but to find a method whereby actual dates could be assigned to the Pueblo ruins and thereby determine the century or years within a century was even more acceptable. Such studies have now given dates to specific archaeological horizons extending back to A.D. 475, while unassociated timbers extend the dating back to A.D. 150. The following Pueblo ruins have been dated: Mesa Verde in southwestern Colorado, A.D. 1073–1272; in northwest New Mexico, Pueblo Bonito A.D. 919–1130; Aztec Ruin, A.D. 1110–1121, and many others with equal positiveness.

The Anasazi.—The Anasazi or Pueblo culture is located in what has been broadly characterized as a vast plateau ranging from 900–2,100 ft. above sea level. This terrain varies from vast open prairie to ragged mountains. Rivers and streams have eroded gorges and perpendicular canyons. The people lived for the most part on the intermediate levels where, even in this arid climate, they perfected agricultural methods to irrigate their soils for the growing of maize. This northern section contains the antecedents of all cultural horizons belonging to the division known as Anasazi. It is encompassed within an area drained by the San Juan, the Rio Grande, the Upper Gila and Salt, and the Little Colorado rivers, most of southern Utah and eastern Nevada. This Anasazi horizon has been divided, on the basis of the material culture and physical types, into two broad categories: the Basket Maker and the Pueblo groups. The earliest evidence of a semi-nomadic cave dwelling group is the Basket Maker. This has been divided into two divisions: Basket Maker and Modified Basket Maker. Here again as in other areas a hiatus of 10,000 years or more exists between the Folsom complex and earliest evidence of the Basket Maker, which may be dated approximately at the beginning of the Christian era.

The earliest evidence of the Basket Maker stage of development places them in a transitional state between a food-gathering mode of life and the very beginning of a food-producing style of existence in which agriculture played an important part. The growing of maize became the foundation for all ensuing cultures. The origin or method of diffusion of this very important cultural trait is unknown. The growing of maize imposed a more sedentary mode of life and necessitated a more permanent habitat. This factor as well as providing a stable supply of food encouraged the development of new arts and a subsequent broadening of the cultural pattern.

The artifacts left by these early Basket Makers are found in the lowest levels of human occupancy of dry caves and shelters. These shelters, however, served mostly as storage places for their food and seeds, which were stored in circular or oval stone-lined pits. Some of these pits were found to contain small, hard, yellow kernels of popcorn-like maize. Some of these pit granaries were also used for beds as well as places for the interment of their dead. From the skeletal material we know that they were a relatively long-headed people of short and slender stature. They were experts in the making of artistically twined woven bags and coiled baskets, sandals, fur-cloth robes, snares and nets for catching small mammals. In the planting of maize they used long, wooden, digging sticks and wooden scoops. Bone tools and curved sticks were used in dressing skins and making garments. They wore feathered headgear and comb-like ornaments as well as necklaces made from coloured stones, bones, shells and seeds. In these early levels no sign of the bow and arrow is found, but in its place is a long spear thrown with the aid of an atlatl, or spear thrower. The Basket Makers had no true fired pottery. However, near the end of this horizon a few unfired clay vessels have been found. Whether this important cultural element originated among these people as a result of lining their baskets with clay or the idea was diffused from other peoples to the south is still debatable. The clay used in the sun-dried forms was mixed with grass and cedar bark to allow for expansion and contraction. Some of the vessels which were molded in baskets extended above the sides by the addition of bands or coils of clay. Others were made without the support of baskets by the coiling process.

The most concentrated centre of this early period is found in what has been termed the Four Corners region, namely, northwestern New Mexico, southwestern Colorado, southeastern Utah and northeastern Arizona. On the basis of tree rings or dendrochronology, the Basket Makers used the caves in this region from about the 1st through the 6th centuries A.D. Elements somewhat comparable to those of the Basket Makers are found as far east as western Texas and south to Coahuila although no definite proof has been found that these cave cultures constitute a direct relationship. Other cultural lags have been identified in the Great Basin area to the north.

The Basket Maker horizon contributed one of the most important

NORTH AMERICAN MAMMALS, BY CARL RUNGIUS

The animals of North America, in general, more closely resemble those of Europe and Northern Asia than those of any other grand division of the world. Many North American mammals have almost exact counterparts in the Old World, as, for example, the bison. A few, however, as the Rocky Mountain goat and the Pronghorn, shown in the illustration, are found only in North America

cultural elements to the subsequent Indian tribes, namely, the beginning of a food-producing economy. Their agricultural traits consisted of at least one variety of maize, pumpkin and beans. At the present time all evidence seems to point to Mexico and Central America for the original domestication of this indigenous wild plant. The necessary steps involved as well as the method of its diffusion have not been determined. Roughly estimated, this period ranges from the beginning of the Christian era to A.D. 500.

The next important period is known as the Modified Basket Maker, indicating a basic Basket Maker culture although somewhat changed in form. The most important changes which occurred during this period are: A few undeformed round-headed individuals in contrast to the earlier long-heads; sandals made with a scalloped instead of the square toe; degeneration in twined woven bags; the making of thin fired pottery vessels; the clustering of houses to form small villages and a better developed residential architecture; the appearance of the bow and arrow; grooved axes and mauls; the domestication of the wild turkey and the growing of additional varieties of maize or corn. This period extended from approximately A.D. 500–750.

BIRD-SHAPED VESSEL WITH BLACK-ON-WHITE DESIGNS. DEVELOPMENTAL PUEBLO PERIOD

After the establishment of a food-producing economy and the manufacture of fired pottery vessels evidence of a new physical type is found coming into the area. The appearance of this new individual marks a new epoch in the gradual transition of this culture. Even though the changes which take place are in no sense radical, the next period has been termed Developmental Pueblo, which is dated from A.D. 750–900. Besides the influx of a people with round skulls, it has been found that some of the skulls have a definite artificial flattening at the back of the head. This deformation, which becomes more pronounced at the end of this horizon and continues in subsequent periods, is explained by the use of a rigid cradle to which the child was securely fastened. A constant pressure against the plastic skull would tend to flatten the back part of the head. By the close of the Modified Pueblo period this flattening of the skull became a standard of personal appearance. By the end of the 8th century all long-headed individuals became submerged.

Other changes in the culture consisted of: elaborate designs on the coiled rod and bundle baskets; growing of cotton and the manufacture of cotton cloth; the exclusive use of the bow and arrow; houses were built above ground in units of 6 to 14 rooms, single story in height made from stone or adobe, in some areas they retained the pole and mud and rectangular pit dwellings; many types of painted and corrugated fire-baked pottery vessels.

This now brings us to the classical or Great Pueblo period which ranges in point of time from about A.D. 900–1250. This, the best known epoch of these prehistoric people, is characterized by extreme development and local specialization in architecture and ceramics. One of the most important characteristics is the building of large multistoried apartment-like dwellings containing about 1,000 rooms, especially in Chaco canyon, the Kayenta district and at Mesa Verde. Here we find examples of the highest architectural achievements. Normally the great house is built around a court. These immense structures were usually rectangular or D-shaped and could serve as a fortress if necessary. The most distinctive type of walls consisted of very thin tabular blocks laid in horizontal bands, which provided an outside surface impervious to erosion. Those structures built in caves, such as the cliff-houses, were relatively thin and flimsy. Many theories exist as to the adoption of these large residences. At the end of the Developmental period the small unit houses were widely scattered near good farming lands. Some believe this connotes peace and freedom from attack. The arrival of foreign predatory raiders forced the Puebloans to gather in larger groups and to construct well defended communal houses; others believe that the development of the large apartment-like dwellings was a natural evolution and the product of an architectural vogue rather than fear of outside marauding groups. Within the central courts numerous types of ceremonial rooms were built. These semi-subterranean structures served as the centre for religious ceremonies. Both the small or common kiva as well as the large or great kiva are an outgrowth of similar ceremonial chambers developed in the Basket Maker period.

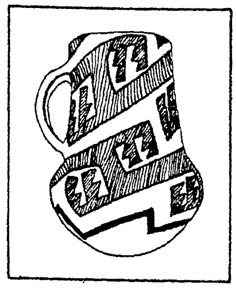
CHARACTERISTICALLY DECORATED JAR OF THE DEVELOPMENTAL PUEBLO PERIOD

Except for the architectural and ceramic developments, very few new traits occur during this horizon. The growing of cotton and loom weaving were the only basic items which had been added to the previous lists. Nevertheless considerable improvements were made in the material culture.



BY COURTESY OF SMITHSONIAN INSTITUTION FROM "BULLETIN 100" OF THE BUREAU OF AMERICAN ETHNOLOGY

A PAINTED PITCHER FROM ONE OF THE CLASSICAL OR GREAT PUEBLO PERIOD SITES IN EASTERN ARIZONA

By the end of the Great Pueblo period various forces caused a general breakdown within the culture centres. This period is known as the Regressive Pueblo, extending from A.D. 1250–1400. There occurred a complete abandonment of the large pueblo structures and the population shifted to the south and southeast, those localities where the first Spanish explorers encountered them and in the general regions where the descendants now make their homes. The entire culture was in a state of flux. Whether this was due to recurring droughts or influenced by pressure of nomadic groups has not yet been determined. The most important settlements, during the transitional period, were made along the Rio Grande river in eastern New Mexico and the Little Colorado river in Arizona.

After the people became established in their new environments many of the older cultural traits with a strong social and religious organization became re-established. The people were tending toward a renaissance. This revival took place from about A.D. 1400–1700. The coming of the Spanish explorers and the subsequent conquest by the Europeans ended the further development of the aboriginal cultural pattern.

From A.D. 1700 to the present is known as the Historic Pueblo. Here we find both the deformed and undeformed crania; the use of moccasins in place of the sandal; baskets of wickerwork and plaited yucca leaves; cotton, wool and commercial textiles of European manufacture; bow and arrow, throwing clubs and European guns; villages of terraced houses and single units such as those of the modern Hopi towns, Acoma, Zuni and Taos.

The Hohokam.—Another important series of prehistoric cultural developments is termed the Hohokam. The evidence for the reconstruction of these people has been found in the general area bordered by the Colorado river on the west, the New Mexico state line on the east, and from Flagstaff, Arizona, on the north to the upper part of the state of Sonora in Mexico. The main centre is concentrated along the middle Gila basin.

The earliest evidence of these people would seem to indicate a sedentary type of subsistence, based on shaped metates for the grinding of maize. This early horizon is known as the Pioneer. The people lived in houses made from poles, brush and mud plaster, the roof supported by four posts, vestibule on one side, square in plan and about 40 ft. across. They made thin plain and red fired pottery vessels. Their crops were watered by means of flood water irrigation. The bodies of the deceased were cremated and the ashes buried in pits. During this period the houses became smaller and more rectangular in shape and the pottery instead of being plain had decorative designs painted on the surface.

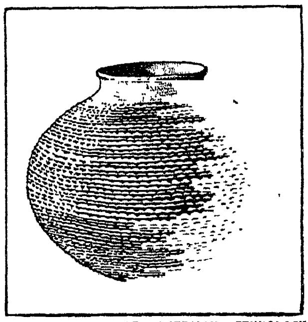
As this pattern of culture developed, other changes were made; new features were incorporated into the construction of their houses; the four posts supporting the roof were reduced to two near the ends of the rectangular houses, and these posts supported a ridge pole. The interiors were not plastered but lined with reeds. Each of the dwellings constituted a unit in the village which was scattered over the semi-arid valleys. Their food-producing fields were irrigated by ditches. The dead continued to be cremated. Ceramic and other industries advanced and became more and more standardized. This horizon is termed Colonial.

The stage known as the Sedentary is marked by new features: The villages were concentrated in smaller areas; two types of houses were constructed, a rectangular one over a shallow pit, with four roof supports, and a similar one built on the surface of the ground, with the framework covered with grass and daubed with mud; some of the villages were surrounded with a compound wall; the irrigation system was enlarged; the ashes of the dead were placed in pottery urns instead of a pit; the forms of pottery vessels were changed. During this Sedentary period and perhaps going back to the end of the Colonial a most unusual type of feature has been recovered, namely, ball courts, or at least structures very similar to those used in Middle America. This implies some connection with the Mexican area to the south. They are the only structures of this nature found north of the Mexican border.

The Classical period, which follows the Sedentary, is interesting because of the evidence showing an invasion of Anasazi people from the plateau country to the north. Even though the people lived side by side, each maintained its distinctive cultural patterns and the association was of such a short duration that no extensive borrowing or hybridization took place. Pueblo structures of stone and adobe were built within the Hohokam communities. The Hohokam cremated their dead while the Anasazi interred their deceased intact. Both Hohokam

and Anasazi types of pottery were used. The great irrigation systems along the Gila and Salt rivers were completed. After a span of about 100 years the Anasazi withdrew to the north while the Hohokam continued to live along their irrigated fields. Because of the seemingly peaceful invasion and on the basis of the Anasazi material culture, a tentative date for this phase in the Hohokam development has been given from about A.D. 1325–1425.

Little is known of the following period, termed Recent, except that the houses were possibly of pole, brush and clay, the dead continued to be cremated, and the pottery vessels were quite plain, resembling the ware of the modern Pima and Papago Indian tribes.



FROM BUREAU OF AMERICAN ETHNOLOGY "REPORT"

VASE FROM PUEBLO VIEJO, GILA VALLEY, ARIZONA

The Modern and last stage of the culture is represented by the Pima and Papago Indian tribes. Some believe that these modern Indians are the descendants of the older Hohokam. Others consider them a mixture of the Hohokam and more recent migrants from outside the area.

The Mogollon.—A third prehistoric pattern of semi-sedentary peoples is called the Mogollon. These inhabited an area centring in the San Francisco and Mimbres river valleys in southwestern New Mexico. Even though preponderantly dependent on agriculture, they supplemented their diet by the hunting of game.

As a whole the developmental stages represented by these people seem to compare with both the Anasazi to the north and the Hohokam to the west. The various phases have been designated as the Georgetown, San Francisco, Three Circle, Mimbres, and the most recent, Animas. The Georgetown period existed prior to the 9th century A.D. The first type of dwellings were deep pit-houses changing from round to rectangular pits with a pole, brush and plaster superstructure, the roof supported by a single post. Associated with the dwellings were ceremonial chambers analogous in type to the kiva structures among the Anasazi. Later houses had shallow pits and finally came the many-roomed, single-storied pueblo type of house. After this the territory was abandoned, the people migrating south to northern Chihuahua, Mexico. The subsequent inhabitants, in the Animas period, consisted of a pueblo-building group with a mixed cultural pattern. Disposal of the dead was usually by inhumation between the houses at first, and later burials were made beneath the floors of houses. Some bodies were cremated, as among the Hohokam. The skulls of the earlier people were low-vaulted, undeformed, round heads, while those buried under the pueblo type houses had high vaults, deformed, round heads. Pottery was made by the coiling process and then smoothed and rubbed. The greatest variations occur in the painted vessels. During the Mimbres period the pottery shows influences from the Hohokam and Anasazi cultures. Some of the earlier forms show some resemblance to pottery forms and decorative techniques comparable to vessels from the Mississippi valley. Certain developmental changes took place in their pipes, metates, mauls, bowls and other artifacts of stone, whereas numerous forms again show the influence from the Anasazi and Hohokam centres.

Besides the three more or less sedentary permanent house and village groups, the peripheral areas were occupied by semi-nomadic peoples. These are represented at least in modern times by the Navaho in central districts surrounding the Anasazi group, the Apache in the south, and the Shoshone along the western peripheries.

THE MISSISSIPPI VALLEY

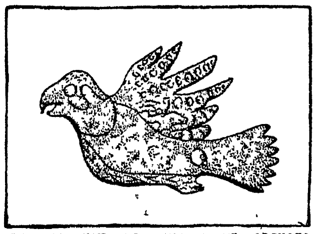
The prevalence of burying their dead in earth mounds, some of which, because of their size, were obvious to the early explorers and European settlers, caused the prehistoric cultures within the Mississippi valley to be given the general name of Mound-builders. Throughout the broad expanse of the Mississippi river drainage there are to be found prehistoric people adapting themselves to the ecological factors of the region. Here the rivers served as highways and the most prolific concentrations of prehistoric villages were located within the broad valleys of the numerous streams and rivers.

After the discovery of the distinctive type of Folsom projectile in association with extinct forms of animals, most of the museums throughout the Mississippi valley were amazed to find comparable types in their miscellaneous collections. A sufficient number have been found in Ohio, Virginia and other states to indicate the wide dispersal of this early horizon throughout the area. None of these points was found associated with any of the later archaeological complexes, but constituted arrowpoints collected from the surface.

As indicated in the other cultural centres, a considerable hiatus exists between this Folsom complex and the more sedentary type of prehistoric cultures. The following described cultures do not antedate A.D. 500. The centuries given for the various manifestations are purely relative. Thus far the dendrochronological studies have not advanced sufficiently to give actual years to the excavated sites. The environment, types of trees used, and method of interment do not preserve the wood to the same extent as in the semi-arid Southwest.

Many names have been assigned to the variety of archaeological remains recovered within the Mississippi valley. Those sites producing objects of European origin are considered protohistoric.

Hopewellian Phase.—Various phases have been determined for classification purposes and these have been subdivided in order to compare the archaeological specimens and determine their relationship. One of the most widespread archaeological manifestations throughout the northern and southern Mississippi valley is termed the Hopewellian phase. It represents one of the earliest of the sedentary groups. The most important diagnostic traits distinguishing it from other cultures found within the valley are: Realistically carved stone platform pipes, cut and hammered copper plates, modelling and painting miniature human figures in clay, intricate variety of woven textiles, conventionalized and realistic design patterns incised on pottery vessels. Much of the material used to portray their artistic talents as well as other artifacts in their culture came from widespread areas. Obsidian, a black volcanic glass, was brought into the Ohio valley from northwestern Wyoming, native copper from the Lake Superior region, barracuda jaws and conch shells from the Gulf of Mexico, mica, in large sheets, from North Carolina. These Ohio people also made good use of the pearls from the nearby freshwater molluscs, colourful flint from outcrops in southern Ohio, as well as the native pipestone for the carving of their animal and bird pipes. Thus far the excavations in southern Ohio, one of the most important centres of this culture, have been confined to the large burial mounds; therefore most of the analysis of the evidence is based on the objects buried with the dead. Burial consisted of a complex mortuary ritual. About 65% of the bodies were cremated and the ashes and unburned fragments of bones were placed in well prepared graves. The remaining 35% were buried extended in the flesh in similarly prepared graves. The bodies or ashes were usually surrounded with a rectangular cribbing of logs and covered with brush or bark, then covered with earth. A considerable number of these adjoining graves were in turn covered with a mound of earth extending 15 ft. or more in height and about 50–75 ft. in diameter. When two or more such mounds were built adjacent to each other they too would be covered with an additional mound, making a large single tumulus 25–30 ft. in height and from 200–300 ft. long and 100 ft. wide. Many smaller mounds were erected within a given area and these were surrounded by earth embankments. These embankments were designed as geometric patterns. On the basis of the evidence thus far produced, the construction of these large mounds, hundreds of small mounds and the surrounding earthworks must have required a relatively dense population and a well coordinated society which would also prescribe a relatively stable economy based on intensive horticulture. Hunting and fishing provided a varied diet. The society must have supported the sculptors and modellers, as evidenced by the number and excellence of the Hopewellian objects of art. To have obtained and transported the raw materials such as obsidian, copper, mica and gulf coast shells required time and encouraged explorations. The construction of the large mortuary tombs postulates a well developed ritual associated with considerable religious fervour. If these factors were due to a restricted ruling class, it must have dominated the greater portion of the central Mississippi valley. Even though no evidence has been found which can be identified with any of the higher culture centres in Mexico or Yucatan, the political organization may have been comparable to the autocratic forms in these areas. Such objects as copper head ornaments, coloured woven garments decorated with hundreds of fresh-water pearls and intricately cut mica, copper axes, black obsidian spear points, copper ear ornaments, and grizzly bear teeth necklaces would certainly clothe a person in a manner that would set him apart from one wearing only a breech cloth and copper ear spools.



BY COURTESY OF OHIO STATE ARCHAEOLOGICAL AND HISTORICAL SOCIETY

FLYING EAGLE, 12½ IN. LONG, MODELLED IN COPPER, FROM THE MOUND CITY GROUP OF OHIO

One of the most interesting problems associated with this manifestation is its origin and distribution. On the basis of pottery decoration, platform pipes, simple earth embankments, mound burial, and a few other traits, a somewhat related group inhabited east central Louisiana. Other elements of comparison to the southern Ohio centre have been found in northern Indiana, central Illinois, eastern Iowa, western Wisconsin, and as far west as Kansas City, Missouri.

Adena Phase.—Another prehistoric manifestation which recent excavations in Kentucky have shown to be somewhat related to the foregoing Hopewellian people has been called the Adena phase. The important burial traits consist of groups of two or more conical shaped burial mounds containing the remains of several individuals placed therein at different periods of time. However, they customarily consist of a central subfloor pit surrounded by wooden timbers. Numerous objects of copper, such as bracelets and finger rings, were worn at the time of burial. Pipes were usually made in the form of a simple tube. In one instance this tube was incorporated within a carved

full length human figure. Except for copper, very few objects were made from material foreign to the Ohio valley. Some of the incised designs on pottery from the Adena sites in Kentucky are comparable to those from Hopewellian sites in Louisiana. The use of tobacco, as evidenced from their pipes, the building of large mounds associated with specialized mortuary custom, together with other traits would imply a rather well organized society of a sedentary nature. To what extent the Adena phase may be related to the Hopewellian phase is undetermined; nevertheless their traits are more comparable to each other than to any of the later prehistoric groups. Here again it is impossible to give a specific period of time for the Adena culture. It is assumed, since no evidence of European trade objects has been recovered in their sites, that they lived along the drainage of the Ohio river before the 18th century and may have been contemporaneous with the Hopewellians.

BY COURTESY OF OHIO STATE ARCHAEOLOGICAL AND HISTORICAL SOCIETY

TUBULAR EFFIGY PIPE FROM AN ADENA MOUND IN OHIO

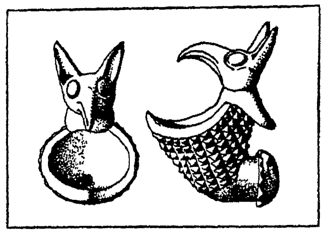
Mississippi Phases.—Herein are grouped a number of somewhat divergent and yet closely related archaeological manifestations. Their relationship to the preceding cultures is somewhat apparent in the southern portions of the Mississippi valley and quite dissimilar in the regions north of the Ohio and Arkansas rivers. At the present time the better known complexes are termed the Middle Mississippi and Upper Mississippi phases. As a whole these cultures are relatively recent, in most cases prehistoric yet later than the Hopewellian and Adena phases. Neither the Middle nor the Upper Mississippi phases existed much before A.D. 1400. The Middle Mississippi group centred between the mouth of the Arkansas northward to the Missouri and Ohio rivers. An eastward extension ranged along northern Mississippi, Alabama, into Georgia and Florida. The Ozark mountains seemed to confine its westward expansion; nevertheless important sites such as the famous Cahokia mounds in East St. Louis, Illinois, and the Angel and Kincaid sites in southern Illinois and Indiana were built by these people. The most important generalized traits consist of the use of earth mounds as foundation platforms on which their temples, chief's house and other ceremonial structures were built. These rectangular truncated pyramids reveal a series of superimposed floors and evidence of structures showing a distinct tendency of rebuilding at the same site.

FROM "PAPERS" OF THE PEABODY MUSEUM

CAHOKIA MOUND, IN ILLINOIS, LOOKING WEST; THE LARGEST PREHISTORIC EARTH-WORK IN AMERICA

These mounds, seldom used for mortuary purposes, are grouped around a plaza. The houses built on their summits were also rectangular in shape, consisting of a single room with walls of bent pole framework covered with cane-thatch or clay. The deceased were usually buried in cemeteries or around the village sites. They made large chipped stone implements for agricultural purposes as well as highly polished celts such as the monolithic ax. Circular discoidal stones were beautifully shaped and polished and used in one of their games. They also carved a few stone vessels and some human statues. Many objects used for fishing, preparation of skin and woven garments, and other utilitarian purposes were made of shell, bone and horn. The large conch shells were cut and carved to form ornaments suspended from the neck. Some of the designs carved on these shells are reminiscent of art forms from prehistoric sites in Mexico.

The pottery made by these people excels that of all other horizons both in the wide variety of forms and in painted decorations on their vessels. Pottery was also used for making pipes, figurines, rattles, ear ornaments, beads and disks. Their vessels consisted of plain type used for utility purposes and the polished ware, some engraved, others painted to produce a red ware, red and white, red, white, and black, and a lost colour technique. A heavy textile impressed pottery was used for the evaporation of liquids, sometimes called salt pans. Wherever stratigraphy has been established the Middle Mississippi overlies the other prehistoric cultures and just prior to those of an early European contact period such as the historic Choctaw, Caddo, Tunica and Natchez Indians This would establish a period ranging from about the 14th to 18th century A.D.



BY COURTESY OF MUSEUM OF THE AMERICAN INDIAN

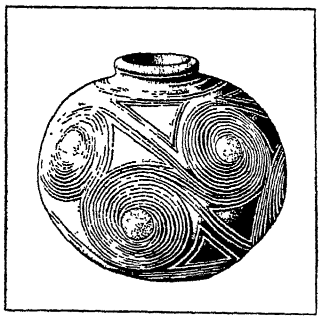
EARTHENWARE EFFIGY PIPE FROM THE NACOOCHEE MOUND, IN GEORGIA

The Upper Mississippi phase as in contrast to the Middle Mississippi phase extends north of the junctions of the Ohio and Missouri rivers with the Mississippi. The greatest concentrations have been found in the southern half of Ohio, southeastern Indiana, northeastern Ohio and western New York, eastern Iowa, Minnesota and central Wisconsin. Extensive village sites as well as mortuary mounds have produced the cultural traits for these late prehistoric people. In the Madisonville site in southern Ohio a few glass beads and iron axes were recovered, indicating a distant contact with early European explorers.

The thousands of small mounds as well as their village sites were used for the disposal of the dead. In contrast to the highly developed mortuary customs of the Hopewellians, among these Upper Mississippi people the deceased were buried in the flesh in the most convenient type of grave, soon after death, and forgotten. Some bodies were tightly flexed and placed in abandoned storage pits, while others were placed extended in rectangular graves. Subsequently storage pits were dug through these graves.

The material culture was largely of a utilitarian nature; very few examples of outstanding artistic merit have been recovered. Their stone objects consisted of small triangular flint projectile points, triangular knives, stone mortars and bell-shaped pestles, chipped and polished celts, and grooved club stones and hammers. Bone was used for every conceivable purpose—fishhooks, harpoons, needles, pins, awls, chisels, scrapers, tools for flaking arrowheads, animal shoulder blades were used for hoes, while other bones were made into whistles, flutes, beamers for preparing skin garments, etc. Shells from the native mussels were adapted for hoes, scrapers, neck ornaments and beads. The fired pottery vessels are quite distinct from the Middle Mississippi and preceding cultural groups. The clay was mixed with both powdered shells and fine grained sand to prevent cracking. Most of the vessels are jars with four or more strap handles. The decoration is primarily incised curvilinear or rectilinear patterns around the upper half of the vessel. The hundreds of cache pits which dotted their village sites were used for the storing of cultivated maize and beans. Here is found evidence of a domesticated dog, often buried with his master.

The above evidence indicates a rather large concentrated population widespread throughout this northern Mississippi watershed. Most of their artifacts were made from local materials. Their villages are located in most of the valleys previously occupied by the Hopewellians, and herein we find some evidence of definite superimposition or burials made in the tops of the large Hopewell mounds.



FROM BUREAU OF AMERICAN ETHNOLOGY "REPORT"

VASE WITH INCISED DESIGN FROM THE LOWER MISSISSIPPI VALLEY

Because a few objects made from European material were recovered from an important village of this group, various attempts have been made to identify the occupants or their descendants with some of the historic Indians visited or described by the first European explorers coming into the Ohio river region. Some believe the location of Mosopelia, as given on maps representing the area in the latter half of the 17th century, to correspond with the site at Madisonville, Ohio. If this hypothesis is correct it would identify the Upper Mississippi people as ancestors of the widely dispersed Siouan groups of historic times. Others imply from the archaeological evidence that the Upper Mississippi phase may represent the ancestors of the Algonquian linguistic stock.

Many of the archaeological manifestations to the west and north, especially those in the Great Plains, which will be described in the next section, seem to have had their original cultural stimulus emanating from the Mississippi river valley.

No attempt has been made to describe all of the cultural variations within the Mississippi valley. The following manifestations will summarize the various archaeological horizons: (1) Prepottery horizons, represented by the builders of extensive shell mounds along the Tennessee river in northern Alabama, Green river, Kentucky and along the falls of the Ohio river in southern Indiana. Along the middle Tennessee river drainage basin these shell mound cultures underlie all other archaeological manifestations. (2) The cave cultures in southern Ohio, Illinois and Kentucky as well as comparable remains in the Ozark mountains area of Arkansas. (3) Hopewellian, Copena and Adena phases. (4) Mississippi phase. (5) Historic period.

GREAT PLAINS

This area encompasses the states east of the Rocky mountains from the Canadian border to the mouth of the Arkansas river. The areas most densely inhabited by prehistoric Indians are those within the region drained by the Missouri and Arkansas rivers and their tributaries. Here as in the Mississippi valley the rivers and streams served as highways and their arable stream valleys provided the soil for the Indians' agricultural pursuits. The chief attraction to aboriginal man, however, were the vast herds of buffalo and other animals.

The variable climatic conditions ranging from the Missouri river to the high plains east of the Rocky mountains had a definite influence on the economy and cultural manifestations of the various archaeological groups. In historic times the Great Plains were inhabited by some 30 historic Indian tribes, such as the great buffalo hunting groups known as the Dakota, Arapaho, Cheyenne, Kiowa, Apache and Comanche. They are characterized by their complete dependence upon the buffalo, and by the skin tepee, dog and later the horse, specialized talent in working skins, numerous men's societies, the Sun Dance and scalp dances. As a result of the adoption of the horse they developed a nomadic food-gathering economy. Farther east, along the Missouri river, were the more sedentary Indian tribes belonging to the Caddoan and Siouan linguistic groups. They lived in grass, bark and earth houses, had pottery and raised maize, which gave them a more stable economy. Because of their large villages inhabited over long periods, more evidence is available for historical reconstructions.

Since the tribes inhabiting the Great Plains were in contact with whites for a considerable period of time during America's westward expansion, many opportunities are offered to complete the record between the last portion of the prehistoric era and the beginning of the historic period. It has not been possible, however, to link the antecedents of all the tribes inhabiting the area either as buffalo hunters or the food-producing sedentary groups. In the case of the Pawnee, excavations of historically documented sites have provided the material culture which has served as distinct indicators for the protohistoric sites, as well as the general antecedents of the Pawnee tribes. Similar studies have been advanced for the Omaha, Mandan and Cheyenne groups.

Within this area have been found sites producing the association of man made objects with now extinct forms of mammals. This has been described in the section on Folsom Man. The next dramatic act of prehistoric man shifts to the east of the high plains along the fertile river valleys, where man could develop a more sedentary form of life by growing maize and beans as well as hunting the bison. How many centuries elapsed between the nomadic Folsom hunters and the raising of domestic food plants is unknown. From the evidence recovered in the Southwest, and allowing ample time for the spread and adaptation of maize and bean cultivation, one may assume that this took place some time after A.D. 500.

The principal semi-sedentary prehistoric horizons within the Great Plains are distantly related to those manifestations east of the Mississippi river. The same temporal position of sequence of cultures occurs in the Great Plains as in the Mississippi valley. A so-called Woodland manifestation underlies all other prehistoric horizons. These sites are small, giving the impression of people from the upper Mississippi river and Great Lakes region pushing into what was to them an unknown land. The sites occur along old stream beds sometimes covered to a depth of 25 ft. The post hole patterns from their houses indicate a thatch type of structure comparable to eastern rather than western forms. Traces of squash and gourds have been found, but no direct evidence of maize cultivation. The stone work consists of roughly made knives and picks. Needles and bone awls were common. Their pottery comprised small to medium sized thin-walled jars with scalloped or incised decorations around the rims. Ceramic forms differ considerably in various sections. Lack of burials prevents a comparison of the physical types.

Some of the sites around Kansas City, Missouri, and extending as far west as Peru, Nebraska, have contained assemblages of cultural material comparable to some of the Hopewellian sites in eastern Iowa and western Wisconsin and Illinois. Although these do not contain all the elements described in the previous section on the Hopewellian phase, they nevertheless indicate a western dispersal of some of the characteristic elements.

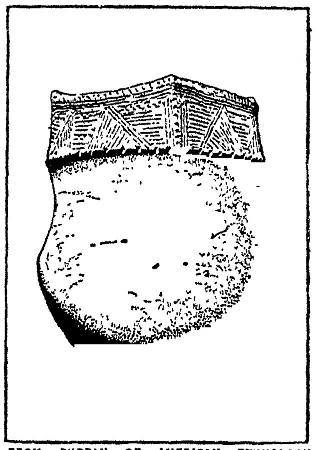
Following the Woodland and Hopewellian horizons, in point of time, are people of a more firmly established occupancy. Because of their wide distribution and prolonged tenure, several distinct variations developed. All of these widely dispersed groups had the following traits in common: A food-producing economy based on maize, beans and squash as the staple crops; a semi-permanent earth lodge subrectangular in shape; several such houses constituted a village, surrounded by their cultivated fields with no apparent attempt at concealment or fortification. This has led to the assumption that considerable freedom was enjoyed by these agriculturists of the Great Plains; the ceramic ware produced at this period differs in form and decoration from the Woodland peoples; the large assortment of implements made from bone, stone, shell and horn provides additional traits of similarity among themselves.

The following cultural divisions have been determined which formed the basic elements out of which the protohistoric and finally the well known historic groups of Indians developed: Upper Republican phase, ancestors of the Pawnee, Arikara and Mandan tribes; Nebraska and Plains-Mississippi phase, largely responsible for the sedentary Siouan groups; Mill Creek phase in the northern Great Plains, out of which developed the Assiniboine, Eastern Dakota, Chippewa and Cheyenne Indians.

The coming of European explorers ended one of the highest cultural attainments of the Great Plains village groups. It also ushered in a period of widespread unrest culminating in the rise and menace of nomadic groups. The adoption of the horse and firearms simplified their dependence on the vast bison herds to such an extent that the region became peopled largely by the roving bands of hunters, forcing the village tribes into small isolated groups along the eastern fringes of the Great Plains.

THE NORTH ATLANTIC AREA

This culture area, sometimes divided into two at the Delaware valley and sometimes into still lesser areas, may be regarded as extending from Newfoundland and the St. Lawrence valley in the north to Georgia in the south, and as including the maritime provinces of Canada, New England, New York, Pennsylvania, Maryland and large portions of Virginia, West Virginia, the Carolinas, the northern part of the territory extending inland indefinitely to the north and west, and its southern part extending westward to the Appalachian mountains. The tribes were chiefly those of the Algonkin, Iroquoian and Siouan stocks of historic times, and save for certain shiftings of boundaries and the extinction especially of most of the Algonkin and Siouan members, the archaeological and known linguistic areas may be regarded as practically coextensive. The forests and highlands afforded excellent hunting; the many rivers and bays, and the sea itself, offered an abundance of fish and shellfish, and while agriculture was practised, it was subordinate to fishing and the chase. Shellfish (oysters, clams, mussels, scallops, whelks, cockles) formed an important part of the diet, as shown by the almost numberless shell refuse heaps along the coast and the tidewater bays, rivers and inlets. One heap at Pope's creek on the Potomac in Maryland, consisting of oyster shells, covered about 30 acres.



FROM BUREAU OF AMERICAN ETHNOLOGY "REPORT"

AN IROQUOIS VASE, 13 IN. IN HEIGHT, FOUND IN A GRAVE IN NORTHERN PENNSYLVANIA

The dwellings of the ancient Indians of the North Atlantic area probably varied in no respect from those of early historic times. Stone as a building material was almost unknown, construction being of wattlework, bark and mats, and the Iroquois villages were often protected with stockades. Cache pits for storage were used in the central part of the area, centring in New Jersey. Some of the houses, as those of the Iroquois, the Mohican, and of Virginia and North Carolina tribes, were of the community type, those of the Iroquois (the well known "long-houses") being 50 to 100 ft. long and 16 to 18 ft. wide.

Burial customs varied more or less with locality, but interment was the usual practice; sometimes the corpse, fully clothed, was placed in the grave in a sitting posture. The custom of the Algonkin and Iroquois tribes from the St. Lawrence to the Delaware was to wrap the corpse and to bind the legs against the trunk, and sometimes, except among the early Algonkins who rarely practised the custom, the implements, utensils and ornaments of the departed were buried with his remains. Interment of dogs, sometimes with the human dead, was common. In the Iroquois area especially the bones of the dead were periodically gathered from their graves and deposited in ossuaries lined with furs and covered with brush and earth, but this was not an Algonkin custom. Among the Powhatan tribes of Virginia two methods of disposal were practised in prehistoric times as well as at the beginning of the Colonial period—the bodies of important men were wrapped and placed on platforms in the "temples," and probably afterward gathered and buried while those of ordinary people were at once inhumed.

In the lower Penobscot valley, in Maine, it was an ancient custom to place quantities of red hematite paint in the graves and to deposit with the dead certain exceptional stone objects only—long slender celts, gouge-adzes, and slate points of bayonet shape, resembling those of the Eskimo. In the abundant shell-heaps of the region such slate points are unknown, and the other implements are either scarce or entirely lacking, whereas bone and shell objects so common to the shell-heaps are not found in the graves. These conditions have given rise to the designation "Red-paint people" to distinguish the earlier from the later inhabitants, not alone because the graves of the ancients contain the hematite deposits, for a similar custom was practised elsewhere in New England as late as Colonial times. There are certain indications that point to relationship with the extinct Beothuk of Newfoundland, as well as with the Algonkin culture of New York

The ceramic art of the North Atlantic area was somewhat rudimentary in comparison with that of other cultures, yet the cooking utensils and the trumpet-like smoking pipes of the Iroquois display considerable taste, and the pipes especially were often elaborately decorated with modelled life forms of miniature jars. The typical Virginian pipe with long stem and upturned bowl, taken to England by early colonists along with the first tobacco, gave form to the clay pipe of the colonial times. The chief distinguishing features of the ancient earthenware vessels of the Iroquois of New York and Pennsylvania are a conical base, constricted neck, and flaring squarish collar usually embellished with an incised rectilinear pattern and sometimes with modelled heads and figures in relief. In the marginal regions—New York bay, Long Island, the lower Hudson valley, Connecticut and Rhode Island—the Algonkin pottery, otherwise usually plain in form and simply decorated by incising or with fabric or cord-marked impressions, often shows Iroquois influence.

Stone objects consisted of the pecked and polished celt-hatchet, grooved axe, chisel, pick, gouge-adze, mortar, long cylindrical pestle, knife and spearhead of slate, and hammer-stone; of these the gouge-adze is of exceptional excellence. Chipped stone implements of all the ordinary types (knives, projectile points, drills, etc.) were plentiful; objects of the same material used as ornaments or in ceremony were bannerstones, bird-shaped stones, "plummets," tubes, pierced gorgets, etc. Not all of these objects are found throughout the area, their distribution depending on the varying sub-cultures of the former tribes and their chronological sequence. Human effigies of stone are rare. Soapstone (steatite) abounds, and owing to its suitability and the ease with which it may be fashioned, it was extensively quarried with stone pickaxes and chisels for manufacturing cooking-pots, smoking pipes and ornaments. Objects of bone, especially in the Iroquois area, are rich in form and variety. Mica was mined in Virginia and North Carolina for use especially in making ornaments and mirrors, and it became an important medium of trade over a wide area, great quantities having been recovered from Ohio mounds. Argillite, jasper and rhyolite were quarried in New Jersey, Pennsylvania and New York, and quartz and quartzite boulder deposits in the District of Columbia and elsewhere for chipping into prodigious numbers of implements and weapons, especially arrowpoints and celt-hatchets (tomahawks). Engraved conch-shell gorgets of Virginia and the Carolinas suggest culture intrusion from the west. Water transportation was by dugout and bark canoes. Petroglyphs, or rock-writings, are rather common, the most noted being Dighton Rock in Taunton river, Massachusetts.

Bibliography.—The following list of references has necessarily been selected from the hundreds of publications covering the archaeological areas in North America. After the more generalized publications, which encompass several cultural areas, the publications have been grouped under the headings as used in the text. Most of the publications cited contain additional bibliographies which would provide more detailed accounts of the specific cultural complexes. The more generalized publications are: *Handbook of the American Indians*, Bull. 30, Bur. Amer. Ethnol. (1907–10); Cyrus Thomas, *Report on the Mound Explorations of the Bureau of Ethnology*, 12th Ann. Rep., Bur. Amer. Ethnol. (1894); various authors, *Essays in Historical Anthropology of North America*, Smithsonian Misc. Coll., vol. 100 (1940); various authors, *The Maya and Their Neighbors* (1940); Clark Wissler, *The American Indian*, 3rd ed. (1938); A. L. Kroeber, *Cultural and Natural Areas of Native North America* (1939).

Publications treating specifically with the culture areas are:

North American Palaeo-Indian.—Ernst Antevs, "Climate and Early Man in North America," *Early Man* (1937); Kirk Bryan, "Geologic Antiquity of Man in America," *Science*, vol. 93, no. 2422 (May 30, 1941); *idem*, "Geology of the Folsom Deposits in New Mexico and Colorado," *Early Man* (1937); Kirk Bryan and Louis L. Ray, *Geologic Antiquity of the Lindenmeier Site in Colorado*, Smithsonian Misc. Coll., vol. 99, no. 2 (1940); M. R. Harrington, *Gypsum Cave, Nevada*, Southwest Mus. Papers no. 8 (1933); Frank C. Hibben, *Evidences of Early Occupation in Sandia Cave, New Mexico, and Other Sites in the Sandia-Manzano Region*, Smithsonian Misc. Coll., vol. 99, no. 23 (1941); Edgar B. Howard, "Evidence of Early Man in North America," *Museum Journal*, Univ. of Pennsylvania, vol. 24, nos. 2–3 (1935); A. E. Jenks, *Pleistocene Man in Minnesota* (1936); F. H. H. Roberts, Jr., *Archaeological and Geological Investigations in the San Jon District, Eastern New Mexico*, Smithsonian Misc. Coll., vol. 103, no. 4 (1942); *idem, Recent Evidence Relating to an Early Indian Occupation in North America*, Proc. 8th Amer. Sci. Cong., 1940 (1942); *idem, Developments in the Problem of the North American Palaeo-Indian*, Smithsonian Misc. Coll., vol. 100 (1940); *idem, The Folsom Problem in American Archaeology*, Ann. Rep., Smithsonian Inst. for 1938 (1939); *idem, Additional Information on the Folsom Complex*, Smithsonian Misc. Coll., vol. 95, no. 10 (1936); Alfred S. Romer, "Pleistocene Vertebrates and Their Bearing on the Problem of Human Antiquity in North America," *American Aborigines* (Toronto, 1933); H. C. Shetrone, "The Folsom Phenomena as Seen from Ohio," *Ohio State Arch. and Hist. Quarterly* (July 1936).

Alaska.—Kaj Birket-Smith, *The Eskimos* (1935); Franz Boas, "Relationships Between North-West America and North-East Asia," *The American Aborigines*, Univ. of Toronto Press (1933); *idem, The Central Eskimo*, 6th Ann. Rep., Bur. Amer. Ethnol. (1888); H. B. Collins, Jr., *Outline of Eskimo Prehistory*, Smithsonian Misc. Coll., vol. 100 (1940); *idem, Archaeology of St. Lawrence Island, Alaska*, Smithsonian Misc. Coll., vol. 96, no. 1 (1937); Ales Hrdlicka, *Catalog of Human Crania in the United States National Museum Collections: Eskimo in General*, Proc. U. S. Nat. Mus., vol. 91, no. 3131 (1942); *idem, Anthropological Survey in Alaska*, 46th Ann. Rep., Bur. Amer. Ethnol. (1930); Diamond Jenness, *Prehistoric Culture Waves from Asia to America*, Journ. Washington Acad. Sci., vol. 30, no. 1 (Jan. 15, 1940); *idem*, "The Problem of the Eskimo," *The American Aborigines, Their Origin and Antiquity* (1933); Waldemar Jochelson, *Archaeological Investigations in Kamchatka*, Carnegie Instit. (1928); *idem, Archaeological Investigations in the Aleutian Islands*, Carnegie Institution (1925); Frederica de Laguna, *The Archaeology of Cook Inlet, Alaska* (1934); Therkel Mathiassen, *The Eskimo Archaeology of Greenland*, Ann. Rep., Smithsonian Inst. for 1936 (1937); *idem, Archaeological Collections from the Western Eskimos*, Rep. of Fifth Thule Exped., 1921–24, vol. 10, no. 1 (Copenhagen, 1930); *idem, Archaeology of the Central Eskimos*, Rep. of Fifth Thule Exped., 1921–24, vol. 4 (Copenhagen, 1927).

Northwest Coast.—Franz Boas, *The Kwakiutl of Vancouver Island*, Memoir, Amer. Mus. Nat. Hist., vol. 8, pt. 2 (1909); *idem, The Decorative Art of the Indians of the North Pacific Coast*, Bull. Amer. Mus. Nat. Hist., vol. 9, art. 10 (1897); Diamond Jenness, *The Indians of Canada*, Nat. Mus. of Canada, Bull. 65 (Ottawa, 1932).

Intermontane.—Ernst Antevs, *On the Pleistocene History of the Great Basin*, Pub. 352, Carnegie Inst. of Washington (1925); L. S. Cressman *et al.*, *Archaeological Researches in the Northern Great Basin*, Pub. 538, Carnegie Inst. of Washington (1942); John Gillin, *Archaeological Investigations in Central Utah*, Peabody Mus. Papers, vol. 17, no. 2 (1941); Neil M. Judd, *Archaeological Investigations at Paragonah, Utah*, Smithsonian Misc. Coll., vol. 70, no. 3 (1919); *idem, Notes on Certain Prehistoric Habitations in Western Utah*, Proc. 19th Internat. Cong. of Americanists, Washington, 1915 (1917); Leonard L. Leh, *Prehistoric Pueblo Ruins in Range Creek Canyon, Utah*, Univ. of Colorado Studies, vol. 23, no. 2 (Jan. 1936); Robert H. Lowie, *Notes on Shoshonean Ethnography*, Anthrop. Papers, Amer. Mus. Nat. Hist., vol. 20 (1924); *idem, The Cultural Connection of California and Plateau Shoshonean Tribes*, Univ. of Calif. Pub. in Amer. Arch. & Ethnol., vol. 20 (1923); Noel Morss, *The Ancient Culture of the Fremont River in Utah*, Peabody Mus. Amer. Arch. and Ethnol., vol. 12, no. 3 (1931); A. B. Reagan, *Additional Archaeological Notes on the Uintah Basin in Northeastern Utah*, Transactions, Kansas Acad. Sci., vol. 37 (1934); Elmer R. Smith, *Areas of Prehistoric and Historical Settlements in Utah*, Proc., Utah Acad. Arts, Sci. & Letters, vol. 17 (1940); J. H. Steward, *Native Cultures of the Intermontane (Great Basin) Area*, Smithsonian Misc. Coll., vol. 100 (1940).

Southwest.—Ernst Antevs, "Dating Records of Early Man in the Southwest," *The Amer. Naturalist*, vol. 70, no. 729 (July–Aug. 1936); J. O. Brew, "Mexican Influence upon the Indian Cultures of the Southwestern United States in the Sixteenth and Seventeenth Centuries," *The Maya and Their Neighbors* (1940); A. E. Douglass, *Dating Pueblo Bonito and Other Ruins of the Southwest*, Nat. Geogr. Soc., Pueblo Bonito Series, no. 1 (1935); J. W. Fewkes, *Archaeology of the Lower Mimbres Valley, New Mexico*, Smithsonian Misc. Coll., vol. 63, no. 10 (1914); H. S. Gladwin, *Excavations at Snaketown II: Comparisons and Theories*, Medallion Papers, no. 26, Gila Pueblo, Globe, Ariz. (1937); H. S. Gladwin, E. W. Haury and E. B. Sayles, *Excavations at Snaketown: Material Culture*, Medallion Papers, no. 25, Gila Pueblo, Globe, Ariz. (1937); S. J. Guernsey and A. V. Kidder, *Basket-Maker Caves of Northeastern Arizona*, Papers Peabody Mus. Amer. Arch. & Ethnol., vol. 8, no. 2 (1921); E. W. Haury, *The Canyon Creek Ruin and the Cliff Dwellings of the Sierra Ancha*, Medallion Papers, no. 14, Globe, Ariz. (1934); *idem, Roosevelt: 9:6, a Hohokam Site of the Colonial Period*, Medallion Papers, no. 11, Globe, Ariz. (1932); *idem, The Mogollon Culture of Southwestern New Mexico*, Medallion Papers, no. 20, Gila Pueblo, Globe, Ariz. (1930); Frank C. Hibben, "The Gallina Phase," *Amer. Antiquity*, vol. 4, no. 2 (Oct. 1938); E. A. Hooton, *The Indians of Pecos Pueblo*, Papers of Southwest Exped. no. 4, Dept. of Arch., Phillips Acad., Andover, Mass. (1930); Neil M. Judd, *Progress in the Southwest*, Smithsonian Misc. Coll., vol. 100 (1940); *idem, Archaeological Observations North of the Rio Colorado*, Bull. 82, Bur. Amer. Ethnol. (1926); *idem, Archaeological Investigations in Utah, Arizona, and New Mexico*, Smithsonian Misc. Coll., vol. 72, no. 6 (1921); A. V. Kidder, *The Artifacts of Pecos*, Papers of the Phillips Academy Southwestern Exped., no. 6 (1932); *idem, An Introduction to the Study of Southwestern Archaeology, with a Preliminary Account of the Excavations at Pecos*, Papers of the Phillips Academy Southwestern Exped., no. 1 (1924); A. V. Kidder and C. A. Amsden, *The Pottery of Pecos*, vol. 1, Papers of the Phillips Academy Southwestern Exped., no. 5 (1931); A. V. Kidder and Anna O. Shepard, *The Pottery of Pecos*, vol. 2, Papers of the Phillips Academy Southwestern Exped., no. 7 (1936); A. L. Kroeber, *Native Culture of the Southwest*, Univ. of Calif. Pub. Amer. Arch. & Ethnol., vol. 23, no. 9 (1928); Paul S. Martin, *Archaeological Work in the Ackmen-Lowry Area, Southwestern Colorado, 1937*, Anthrop. Ser., Field Mus. Nat. Hist., vol. 23, no. 2 (1938); *idem, Lowry Ruin in Southwestern Colorado*, Anthrop. Ser., Field Mus. Nat. Hist., vol. 23, no. 1 (1936); Earl H. Morris, *Archaeological Studies in the La Plata District, Southwestern Colorado and Northwestern New Mexico*, Pub. 519, Carnegie Instit. of Washington

(1939); *idem, The Beginnings of Pottery Making in the San Juan Area; Unfired Prototypes of the Earliest Ceramic Period,* Anthrop. Papers, Amer. Mus. Nat. Hist., vol. 28, pt. 2 (1927); Earl H. Morris and Robert F. Burgh, *Anasazi Basketry,* Pub. 533, Carnegie Instit. of Washington (1941); Paul H. Nesbitt, *Starkweather Ruin. A Mogollon-Pueblo Site in the Upper Gila Area of New Mexico, and Affiliative Aspects of the Mogollon Culture,* Bull. 6, Logan Mus. Pubs. in Anthrop., Beloit College (1938); Elsie Clews Parsons, "Relations Between Ethnology and Archaeology in the Southwest," *Amer. Antiquity,* vol. 5, no. 3 (Jan. 1940); F. H. H. Roberts, Jr., "Archaeology in the Southwest," *Amer. Antiquity,* vol. 3, no. 1 (July 1937); *idem, A Survey of Southwestern Archaeology,* Ann. Rep. Smithsonian for 1936 (1936); E. B. Sayles, *An Archaeological Survey of Chihuahua, Mexico,* Medallion Papers, no. 22, Gila Pueblo, Globe, Ariz. (1936); F. M. Setzler, "A Prehistoric Cave Culture in Southwestern Texas," *Amer. Anthrop.,* vol. 37, no. 1, pt. 1 (1935).

Mississippi Valley.—Glenn A. Black, *Excavation of the Nowlin Mound,* Indiana History Bull., vol. 13, no. 7 (1936); Joseph Caldwell and Catherine McCann, *Irene Mound Site, Chatham County, Georgia* (1941); Fay-Cooper Cole and Thorne Deuel, *Rediscovering Illinois,* Univ. of Chicago Pubs. in Anthrop., Arch. Ser. (1937); S. D. Dickinson and Harry J. Lemley, *Evidences of the Marksville and Coles Creek Complexes at the Kirkham Place, Clark County, Arkansas,* Bull. 11, Texas Arch. & Paleon. Soc. (1939); J. A. Ford and Gordon R. Willey, "An Interpretation of the Prehistory of the Eastern United States," *Amer. Anthrop.,* n.s., vol. 43, no. 3, pt. 1 (July–Sept. 1941); *idem, Crooks Site, a Marksville Period Burial Mound in La Salle Parish, Louisiana,* Louisiana Dept of Conservation, Anthrop. Study 3 (1940); Gerard Fowke, *Archaeological Investigations,* 44th Ann. Rep., Bur. Amer. Ethnol. (1928); *idem, Archaeological Work in Louisiana,* Expl. & Field-Work of Smithsonian Inst. in 1926, Smithsonian Misc. Coll., vol. 78, no. 7 (1927); E. F. Greenman, "Excavation of the Coon Mound and an Analysis of the Adena Culture," *Ohio State Arch & Hist. Quarterly,* vol. 41, no. 3 (1932); James B. Griffin, *The Fort Ancient Aspect. Its Cultural and Chronological Position in Mississippi Valley Archaeology* (1943); M. R. Harrington, *Certain Caddo Sites in Arkansas,* Indian Notes & Monographs, Misc. no. 10, Mus. Amer. Indian, Heye Foundation (1920); W. H. Holmes, *Aboriginal Pottery of the Eastern United States,* 20th Ann. Rep., Bur. Amer. Ethnol. (1903); *idem,* "Aboriginal Copper Mines of Isle Royal, Lake Superior," *Amer. Anthrop.,* n.s., vol. 3 (1901); E. A. Hooton and C. C. NORTHAMPTON, EARLS AND MARQUESSES OF. The Northampton title has been held in various English families. About 1080 Simon de Senlis (d. 1109), a Norman noble, and the builder of Northampton castle, was created earl of Northampton as well as earl of Huntingdon by William the Conqueror; his son Simon (d. 1153) was also recognized in the title about 1141, though his stepfather, David, king of Scotland (1084–1153), had meanwhile obtained the earldom in right of his wife. The second Simon died childless. In 1337 William de Bohun (*c.* 1310–60), a son of Humphrey de Bohun, 4th earl of Hereford and 3rd earl of Essex, was created earl of Northampton; and his son Humphrey, who succeeded, fell heir in 1361 to the earldoms of Hereford and Essex, which thus became united under that of Hereford. The titles, however, became extinct at his death in 1372.

In 1547 William Parr (1513–71), son of Sir Thomas Parr and brother of Catherine Parr, queen of Henry VIII., was created marquess of Northampton, and though attainted in 1553 was re-created marquess in 1559. He favoured the claim of Lady Jane Grey to the English throne. Although sentenced to death he was pardoned and released from prison at the end of 1553. North-

ampton died at Warwick on Oct. 28, 1571. He left no children and his marquessate became extinct. In 1604 Henry Howard (*see* below) was created earl of Northampton, his title dying with him. It next passed into the Compton family, where it has since remained. The 1st earl of Northampton in this line, William Compton (d. 1630), who received the title in 1618, was a great-grandson of the Sir William Compton (1482–1528) who was with Henry VIII. at the Field of the Cloth of Gold, and his son the 2nd earl is noticed below. The 9th earl, Charles Compton (1760–1828), was created a marquess in 1812, receiving at the same time the titles of Earl Compton and Baron Wilmington.

Henry Howard, earl of Northampton (1540–1614), was the second son of Henry Howard, earl of Surrey, the poet, and of Lady Frances Vere, daughter of the 15th earl of Oxford, and younger brother of Thomas Howard, 4th duke of Norfolk. After discovery of his brother's plot to marry Mary, Queen of Scots, and of his own correspondence with her, he was arrested more than once on suspicion of harbouring treasonable designs. In 1583 he published a work entitled *A Defensative against the Poyson of supposed Prophecies*, an ostensible attack upon astrology, which, being declared to contain heresies and treason, led to his imprisonment for a short time. After the accession of James I. he received many honours, and became Lord Privy Seal (1604) and a commissioner of the treasury (1612). He was one of the judges at the trials of Raleigh and Lord Cobham in 1603, of Guy Fawkes in 1605, and of Garnet in 1606, in each case pressing for a conviction. In 1604 he was one of the commissioners who composed the treaty of peace with Spain, and from that date he received from the Spanish Court a pension of £1,000. Northampton died on June 15, 1614. His title died with him. Northampton built Northumberland house in London and superintended the construction of the fine house of Audley End. He founded and planned several hospitals. Bacon included three of his sayings in his "Apophthegms," and chose him as "the learnedest councillor" in the kingdom to present to the king his *Advancement of Learning.*

Northampton's works are: a *Treatise of Natural and Moral Philosophy* (1569; ms. in the Bodleian library); a pamphlet supporting the union between Elizabeth and the duke of Anjou (1580; Harleian mss. 180); *A Defensative against the Poyson of supposed Prophecies* (1583); a reply to a pamphlet denouncing female government (1589; Harleian ms. 7021); *Duello Foiled*, printed in T. Hearne's *Collection of Curious Discourses* (1775), and ascribed there to Sir Edward Coke; *Translation of Charles V.'s Last Advice to Philip II.*, dedicated with a long epistle to the queen (Harl. 836, 1506 and elsewhere in Stowe 95, King's mss. 106); devotional writings (Arundel mss. 300); speeches at the trials of Guy Fawkes and Garnet in *State Trials*, vol. i. In Somers Tracts (ed. 1809), ii. 136, his opinions on the union between England and Scotland are recorded.

See the life in *Surrey's and Wyatt's Poems*, ed. by G. F. Nott (1815), and Sidney Lee's article in the *Dict. Nat. Biog.*

Spencer Compton, 2nd earl of Northampton in the Compton line (1601–43), was the son of William, 1st earl, lord president of the marches. On the outbreak of the Civil War he was entrusted with the execution of the commission of array in Warwickshire. After varying success and failure in the Midlands he fought at Edgehill, and after the king's return to Oxford was given, in November 1642, the military supervision of Banbury and the neighbouring country. He was attacked in Banbury by the parliamentary forces on Dec. 22, but relieved by Prince Rupert the next day. In March 1643 he marched from Banbury to relieve Lichfield, and having failed there proceeded to Stafford, which he occupied. Thence on March 19, accompanied by three of his sons, he marched out with his troops and engaged Sir John Gell and Sir William Brereton at Hopton Heath. In the moment of victory he was surrounded by the enemy, and, refusing quarter, was slain.

See the article in the *Dict. of Nat. Biog.* by C. H. Firth; E. B. G. Warburton, *Life of Prince Rupert;* S. R. Gardiner, *Hist. of England and of the Civil War; Thomason* Tracts, E 99 (18) (Hopton Heath and Northampton's death), E 103 (11) (elegy), E 111 (11), E 110 (8) 1642 (Proceedings at Banbury), E 83 (47) (speech).

NORTHAMPTON, county town of Northamptonshire, England, 66 mi. N.W. by N. from London by the London Midland Region railway. Pop. (1951) 104,429. Area 9.7 sq.mi.

British and Roman remains have been discovered near Northampton and it became the chief settlement of the Angle tribes early in the 6th century. It was occupied by the Danes in the reign of Edward the Elder. It is mentioned as a borough in Domesday. Henry II granted the incorporation charter in 1189. Tanning was an industry in the time of Edward I and in 1675 a law was made forbidding strangers to purchase hides in the town except on fair days. Boots and shoes were made here in the reigns of John and Edward I, and by the 17th century Northampton was one of the most noted places in England for their manufacture.

Northampton was the meeting place of several important councils and parliaments. In the wars between John and his barons the castle withstood a siege by the latter, but in 1264 it was occupied by the barons under the earl of Leicester. In the Wars of the Roses it was the scene of the battle in which Henry VI was defeated and taken prisoner in 1460. During the Civil Wars of the 17th century it was held for the parliament by Lord Brooke. In 1675, 600 houses were destroyed by fire.

The town is situated on the river Nene. The main roads converging upon the town meet near the centre in a market place. An important building scheme was the civic centre, which includes a fire station (1935), public baths (1936) and police buildings (1941). All Saints church was rebuilt after the fire of 1675, but retains its Decorated embattled tower. The church of St. Giles, a cruciform structure in the 12th century, has been greatly changed, and besides a Norman doorway contains Early English, Decorated and Perpendicular work. St. Peter's is supposed to be of the same date and its interior is Norman. St. Sepulchre's, one of the four round churches remaining in England, may have been built by the Knights Templars at the close of the 11th century.

Northampton is the seat of a Roman Catholic bishop, the cathedral being in Early Decorated style. Near the town there were a Cluniac priory of St. Andrew, a house (Delapré) for nuns of the same order, and one for Augustinian canons, but only of the last are there any remains. Some portions of the castle were re-erected on a new site after their destruction when the Castle station was built by the L.M.S. company. In Hardingstone, south of the town, is one of the original Eleanor crosses. The town and county school was founded in 1541. The charitable foundations include St. John's hospital (12th century). There is a race course north of the town. The staple trade is the manufacture of boots and shoes. There are also iron foundries, maltings, breweries and flour mills. The cattle market is extensive. The county borough returns one member to parliament.

NORTHAMPTON, a city of Massachusetts, U.S.A., the county seat of Hampshire county; on the Connecticut river and federal highways 5 and 10; 16 mi. N. of Springfield. It is served by the Boston and Maine and the New York, New Haven and Hartford railways, also by eight bus lines. Pop. (1950) 28,998; in 1940 it was 24,794. Venerable trees, an irregular plan and the grounds of its many institutions make the city very attractive. It is the home of Smith college (*q.v.*), two preparatory schools for girls, Northampton State hospital, U.S. Veterans' Administration hospital and the Clarke School for the Deaf (1867).

Mt. Holyoke, 954 ft., is 2 mi. S.E. of the city; Mt. Tom, 1,214 ft., is 6 mi. S. of the city. The city's industrial output includes silk stockings, brushes, cutlery, machine tools, ladies' hats and dresses.

Northampton was settled in 1654, became a separate town in 1656 and was incorporated as a city in 1883.

It was the birthplace of Caleb Strong, Joseph Hawley, Cornet Parsons and Timothy Dwight.

Jonathan Edwards was pastor there from 1727 to 1750. It was the home of Calvin Coolidge.

NORTHAMPTON, a borough of Northampton county, Pennsylvania, U.S., on the Lehigh river, 6 mi. N.W. of Allentown; served by the Jersey Central and the Northampton and Bath railroads. Population (1950) 9,359; (1940) 9,622 by the federal census. It is a cement-manufacturing centre, and there are textile mills.

It was settled about 1740 and incorporated in 1901.

NORTHAMPTON, ASSIZE OF, a short code of English laws issued in 1176, drawn up in the form of instructions to six committees of three judges each, who were to visit the six circuits into which England was divided for the purpose. Though purporting to be a reissue of the Assize of Clarendon (1166), it contains in fact many new provisions. As compared with the earlier assize it prescribes greater severity of punishment for criminal offences; arson and forgery were henceforth to be crimes about which the jurors were to enquire, and those who failed at the ordeal were to lose a hand as well as a foot. In what is perhaps the most important section we may probably see the origin of the possessory action of *mort d'ancestor,* an innovation scarcely less striking than the institution of the *novel disseisin* in the winter of 1166. The justices were also ordered to try proprietary actions commenced by the king's writ for the recovery of land held by the service of half a knight's fee or less. In their fiscal capacity they were to enquire into escheats, churches, lands, and women in the king's gift. The royal bailiffs were to answer at the exchequer for rents of assize and all the perquisites which they made in their offices, and apparently the duty of enforcing this provision was entrusted to the justices. As a result of the rebellion of 1173–74 it was provided that an oath of fealty should be taken by all, "to wit, barons, knights, freeholders, and even villeins (*rustici*)," and that any one who refused should be arrested as the king's enemy, and the justices were to see that the castles, the demolition of which had been ordered, were razed.

See Pollock and Maitland, *History of English Law* (1898); Stubbs, *Constitutional History of England* (1895). The text occurs in *Cronica Rogeri de Howden* (Rolls Series), ii. 89, and *Gesta Henrici Regis Secundi* (Rolls Series), i. 108. It has been reprinted from the latter by Stubbs in *Select Charters* (1913). (G. J. T.)

NORTHAMPTONSHIRE, an east midland county of England, bounded north by Lincolnshire, north-west by Rutland and Leicestershire, west by Warwickshire, south-west and south by Oxfordshire, south-east by Buckinghamshire, and east by Bedfordshire, Huntingdonshire and Cambridgeshire. The area of the geographical county is 998 sq.mi.

Geology and Physical Features.—The underlying structure of the county is very simple. It forms part of the Jurassic escarpment, here known as the Northampton uplands. All the rocks are of Jurassic age, the dip being in a general way to the south-east, and the strike from south-west to north-east. The oldest, and most westerly belt consists of Lias formations which cover a large surface in the south-west and centre, around Banbury, Daventry and Market Harborough, and they are also exposed along the rivers near Towcester, Northampton, Wellingborough and Kettering. The marlstones of the Middle Lias were formerly much used for building material; the Upper Lias is worked for bricks at Easton Neston (Towcester), Blisworth, Gayton, Heyford, Northampton, Wellingborough, Rushden, Irthlingborough, Kettering and Corby. Through the middle of the county, north-east to Northampton, Rockingham and Peterborough, is an elevated tract of Oolitic rocks, which formerly supplied stone, of which many of the villages are built, as well as lime and marl. The New Duston quarries have several varieties of good stone, the district around Northampton a limestone known as Pendle, and Weldon (Lincolnshire Oolite) a noted freestone; Barnack Rag (near Stamford) is no longer worked. The great Oolite limestone, though unsuitable for building material, owing to the ease with which it weathers, was largely used in the past, Culworth, Blisworth and Cosgrove quarries being famous. At the base of the Inferior Oolite, Northampton sands yield iron ore, which is worked at Duston, Culworth, Towcester and at numerous localities north-east of Northampton. Certain hard shelly beds in the Oolite rocks have been polished and used as marble.

On the south-east border of the county, a belt of Oxford clay occupies the surface, good exposures occurring in the brick fields about Peterborough. Boulder clay is widely distributed over the uplands and in the east of the county, and glacial and river gravels are also plentiful. The south-west portion of the county forms the principal watershed of the Midlands; the Cherwell, the Avon, the Leam, the Welland, the Nene have their sources in this region, and all form sections of county boundaries. The position of Daventry as a wireless station and a meeting place of roads is also related to this fact of centrality and elevation. The longitudinal river Nene flows in a north-easterly direction along the foot of the uplands, draining them to the Wash.

History and Early Settlement.—In primitive times the waters of the North sea reached almost to the foot of the Northamptonshire uplands. The immigrants of the end of the Stone age seem to have penetrated up from the coast, and Peterborough has yielded important finds of early pottery. Some Beaker pottery occurs, chiefly on the uplands. There are a few material objects of the La Tène I. culture and the La Tène III. culture. During the Iron age, the uplands offered defensible sites, and many hill camps were made, Hunsbury (1½ m. S.W. of Northampton), being one of the most famous. In Roman times, iron, stone and clay were worked, and Towcester was an important station on the Watling street route to the north-west. At some time in the 7th century the district suffered a simultaneous invasion (West Saxons from the south, Anglian tribes from the north), finds show a mingling of races, but West Saxon influence never spread farther north than a line from Daventry to Warwick, and with the extension of the Mercian kingdom under Penda and the conversion of the midland districts, ceased altogether. The abbey at Medehamstede (now Peterborough) was begun by Saxulf, a monk, and Penda's son, Peada, in 655. Foundations were also established at Peakirk, Weedon Beck, Castor and Oundle. In 870 the district was overrun by the Danes, and Northampton was one of the five Danish boroughs, until in 921 it was recovered by Edward the Elder, who fortified Towcester in that year.

In the 11th century Northamptonshire was included in Tostig's northern earldom; but in 1065, together with Huntingdonshire, it was detached from Northumbria and bestowed on Waltheof. The monastic foundation of Peterborough survived the Conquest. Norman castles existed at Rockingham, Barnwell, Lilbourne and Northampton. The shire is probably of Danish origin, representing in the 10th century the area which owed allegiance to Northampton as a political and administrative centre. In 921 this area extended to the Welland, and at the time of the Domesday survey the boundaries were approximately those of the present day. Northamptonshire is first mentioned by name in the *Historia Eliensis,* in connection with events which occurred at the close of the 10th century.

The Geld roll (William I.) and Domesday (1086) mention 28 hundreds in Northamptonshire, and part of Rutland is assessed under this county. By 1316 the divisions were changed, re-named and reduced to 20, and have remained practically unaltered. The names of the hundreds point to primitive meeting-places gradually superseded by villages and towns, and the court for Fawsley hundred met under a large beech tree in Fawsley park until the beginning of the 18th century, when it was transferred to Everdon. The shire-court originally met at Northampton.

Northamptonshire was originally included in the diocese of Lincoln. The archdeaconry of Northampton is mentioned in the 12th century, and in 1291 included the deaneries of Peterborough, Northampton, Brackley, Oundle, Higham, Daventry, Preston, Weldon, Rothwell and Haddon. The diocese of Peterborough was created in 1541, and in 1875 the archdeaconry of Oakham.

At the time of the Domesday survey the chief lay-tenant in Northamptonshire was Robert, earl of Mortain, whose fief escheated to the Crown in 1106. The estates of William Peverel, founder of the abbey of St. James at Northampton, also escheated to the Crown in the 12th century. Holdenby House was built by Sir Christopher Hatton, privy councillor to Queen Elizabeth, and Yardley Hastings was named from the Hastings, formerly earls of Pembroke. Higham Ferrers was the seat of the Ferrers family; Braybrook Castle was built by Robert de Braybrook, a favourite of King John; and Burghley House gave the title of baron to William Cecil. During the middle ages the Nene was a busy artery of trade, and many moated homesteads were built on its banks.

Northampton was a favourite meeting-place of the councils and parliaments of the Norman and Plantagenet kings. In 1215 John was besieged in Northampton castle by the barons, and in 1264

Henry III captured the castle from the younger Simon de Montfort. During the Wars of the Roses Henry VI was defeated at Northampton in 1460. In the Civil War of the 17th century the county declared almost unanimously for the parliament. A royalist garrison was placed at Towcester by Prince Rupert in 1644, but almost immediately withdrawn

In 1547 Brackley and Peterborough returned each two members, and in 1557 Higham Ferrers returned one member. Under the act of 1832 the county returned four members in two divisions, the above boroughs being merged in the county divisions. There are now four divisions with one member each, in addition to a member for the county borough of Northampton

Architecture.—Of monastic foundations, the abbey-church of Peterborough, afterwards the cathedral, is the only remaining one of importance. At Geddington, and also at Hardingstone, near Northampton, there is an Eleanor cross, erected by Edward I. The county is famous for its churches with beautiful broached spires. To the Saxon period belong the tower of Earls Barton church, on what is probably the mound of an old English strong-house; the tower, etc., at Brigstock; the ground plan, etc., at Wittering; the remarkable tower at Barnack; and Brixworth church, by some believed to include part of a Roman basilica. Of Norman work, excluding Peterborough cathedral, the finest examples are St. Peter's and St. Sepulchre's, Northampton, and the tower of Castor church. St. Mary's church, Higham Ferrers, formerly collegiate, Early English and Decorated, is one of the finest churches in the county; the churches at Irthlingborough and Lowick, with their lantern towers, Warmington, fine Early English work, Rushden, Finedon, Raunds and Fotheringhay should be mentioned.

A gateway at Rockingham, and earth-works at Higham Ferrers and Brackley are worthy of mention. Some castellated ruins remain of the castle at Fotheringhay, famous as the scene of the imprisonment, trial and execution of Mary, Queen of Scots. Barnwell castle, founded by William the Conqueror, is still a fine ruin, which includes four of the round towers and an imposing gateway. Holdenby manor house, where Sir Christopher Hatton (1540–1591) was born, and whence Charles I was carried away by Cornet Joyce, is largely restored. Among ancient mansions are Castle Ashby, the seat of the Comptons; Althorp, the seat of the Spencers; Drayton House; Burghley House, Stamford, founded by Lord Burleigh (1553); and Kirby Hall, a beautiful Elizabethan building once the residence of Sir Christopher Hatton.

Climate and Agriculture.—The climate of Northamptonshire is mild, and it is drier than many other inland districts owing to its low elevation (rarely more than 700 ft.). The mean annual rainfall at Wellingborough is 27·2 in. The soil is fertile, 84½% of the surface being under cultivation in 1939. The Lias clay belt gives rise to good grazing, and 303,889 ac., or about 46%, were under permanent pasture. Large numbers of cattle (152,024 in 1939) are fattened, droves from Scotland, Ireland, Wales, Hereford being sent for that purpose. The selling of fat cattle for Christmas markets, sets the population free in winter for hunting, giving rise in the 18th century to the making of whips at Daventry, while the long winter evenings encouraged the use of the tobacco-pipe, made almost exclusively from Northampton clays. Easy access to hides and to bark for tanning in the forests originated an industry in leather, which flourished in Norman times, and, in the middle of the 17th century Northampton began to specialize in the manufacture of boots and shoes, for which it has become famous. The difference in bulk between imported raw hides and exported finished boots and shoes creates an economic problem in connection with this trade. Good wheat can be grown on the boulder clay, and 11½% of the county was under grain in 1939, wheat accounting for 44,304 ac. Beans form an important crop; root-crops are also grown; sugar-beet is a fast developing industry (5,408 ac. in 1939, as against 1,077 ac. in 1926).

Sheep are kept in large numbers on the rich pastures, improved Leicesters for wool and Southdown for mutton. Wool was important in Norman times; in the 17th century the centre of weaving changed from Northampton to Kettering. Charcoal-burning was an early industry in the forests (Rockingham, etc.), mast from the oaks also feeding large numbers of pigs; these are still important. Paper-making, dependent on pure water, was introduced in the 18th century; early in the 19th, silk-weaving spread from Coventry.

Communications.—Two main lines of the L.M. and S. railway cross the county, linking London with the industrial northwest. The first is the Wolverton (Bucks) Blisworth, Rugby (Warwick) line, with an alternative route to Northampton, and branches northeast to Peterborough and north to Market Harborough (Leics.); with it are connected at Blisworth junction, branch lines through Towcester, west to Stratford-on-Avon (Warwick) and southwest to Banbury (Oxon). The second is the Wellingborough, Kettering, Market Harborough line with a branch to Oakham (Rutland). There are other branch lines. A main line of the L. and N.E. railway passing through the south of the county, connects with the G.W. railway at Banbury through Woodford. The Grand Junction canal, which is connected with the Oxford canal, enters the county at Braunston on the borders of Warwickshire, and passes by Daventry and Blisworth into Buckinghamshire, a branch connecting it with Northampton. The Grand Union canal unites with the Grand Junction near Daventry, and runs north until it joins the Leicester canal at Foxton, branches passing to Welford and Market Harborough.

Population and Administration.—The area of the administrative county is 905 sq.mi.; pop. (1951 census) 359,550. The soke of Peterborough, itself an administrative county, has an area of 84 sq.mi. and a population (1951 census) of 63,784, while the county borough of Northampton occupies 9.7 sq.mi. Wartime evacuation from the eastern counties of England and an increase in agriculture and industry caused a rise of 17% in the population of the geographical county between Sept. 1939 and Feb. 1941. In Domesday the county is mentioned as containing 30 hundreds, but it then included a considerable part of Rutland. These divisions were first reduced to 28, and in the reign of Henry II to 20, their present number. The administrative counties include four municipal boroughs, namely, Brackley, Daventry, Higham Ferrers and Kettering, in addition to Peterborough and Northampton. There are one court of quarter sessions and nine petty sessional divisions. The borough of Northampton and the liberty of the soke of Peterborough have each a separate court of quarter sessions and a separate commission of the peace. The total number of civil parishes in 1943 was 295, of which 25 were in the soke of Peterborough. The geographical county, including the soke of Peterborough, is in the diocese of Peterborough. The National Trust owned 31 ac. in Northamptonshire in 1942. For parliamentary purposes the county is divided into four divisions, Daventry, Kettering, Peterborough and Wellingborough. The parliamentary borough of Northampton returns one member.

See *Victoria County History, Northamptonshire;* John Norden, *Speculi Britanniae, pars altera,* or *A Delineation of Northamptonshire* (1720); John Bridges, *History and Antiquities of Northamptonshire,* compiled by Rev. Peter Whalley (2 vols., Oxford, 1791); Francis Whellan, *History, Topography and Directory of Northamptonshire* (2nd ed., London, 1874).

NORTH ANDOVER, a manufacturing town of Essex county, Massachusetts, U.S.A., on the Merrimack river, 2 mi. E. of Lawrence. The population was 8,485 in 1950; in 1940 it was 7,524. The town was settled about 1643, and a house built in 1667 by Simon Bradstreet, one of the founders, is still standing. His wife, Anne Dudley Bradstreet (1612–72), was the first woman in America to make a reputation as a poet. North Andover was set off from Andover and incorporated as a town in 1855.

NORTH BAY, a lumber, mining and railway city on the northeast shore of Lake Nipissing, northern Ontario, Canada, 227 mi. N. of Toronto, on the Canadian Pacific, Canadian National, and Ontario Northland railways and a port of call of the main Trans-Canada Air Lines. It is the base of supply for the mining districts of Cobalt, Gowganda and Porcupine, and is a summer resort. It is within 10 mi. of the home of the Dionne quintuplets. Pop. (1951) 17,899.

NORTH BERWICK, royal and small burgh, East Lothian, Scotland. Pop. (1951) 4,001. It is on the south shore of the entrance to the Firth of Forth, 22½ mi. E.N.E. of Edinburgh by the L.N.E.R., the terminus of a branch line from Drem Junc-

tion. Created a royal burgh by Robert III (d. 1406), it was once a port of some importance, but dwindled to a fishing hamlet. It is probably the most fashionable watering place in Scotland, frequented for bathing and golf. Here are the ruins of an abbey of Cistercian nuns founded by David I, and to the south rises the fine cone of North Berwick Law.

NORTH BRADDOCK, a borough of Allegheny county, Pennsylvania, U.S.A., 10 mi. S.E. of Pittsburgh, on the hills back of Braddock and Rankin. The population was 14,724 in 1950; in 1940 it was 15,679; and in 1930 it was 16,782 by the federal census. The three boroughs form one community and industrial centre, with large steelworks and other important manufactures. North Braddock is chiefly a residential section, but one of the largest steel plants is within its limits.

The first white man's cabin west of the Alleghenies was built there in 1742 by John Frazier.

On the ground now occupied by Braddock and North Braddock was fought (July 9, 1755) the battle in which Gen. Edward Braddock was defeated.

NORTHBRIDGE, a town of Worcester county, Massachusetts, U.S.A., on the Blackstone river, 13 mi. S.E. of Worcester; served by the New York, New Haven and Hartford railroad. Pop. (1950) 10,328; by the 1940 census it was 10,242. It is a manufacturing town, making principally textile machinery, textiles and paper.

Part of Uxbridge was established as the district of Northbridge in 1772, and in 1775 the district was made a town.

NORTHBROOK, THOMAS GEORGE BARING, 1ST EARL OF (1826–1904), English statesman, eldest son of the first baron (long known as Sir Francis Baring; *see* BARING), was born on Jan. 22, 1826, and educated at Christ Church, Oxford, where he graduated with honours in 1846. He was successively private secretary to Mr. Labouchere (Lord Taunton), Sir George Grey and Sir Charles Wood (Viscount Halifax). He was member of parliament for Penryn and Falmouth (1857–66). He was a lord of the admiralty in 1857–8; undersecretary for war, 1861; for India, 1861–4; for the home department, 1864–6; and secretary to the admiralty, 1866. In the Gladstone ministry of 1868 Northbrook was undersecretary for war (1868–72). He was then governor general of India, but resigned in 1876, because his policy of coming to an arrangement with Shere Ali, which might have prevented the Afghan War, was overruled by the duke of Argyll, then secretary of state. From 1880 to 1885 Northbrook, who had received an earldom, was first lord of the admiralty in Mr. Gladstone's second government. In Sept. 1884 Northbrook was sent to Egypt as special commissioner to enquire into its finances. He died on Nov. 15, 1904.

See B. Mallet, *Thomas George, Earl of Northbrook* (1908).

NORTH CAPE, a promontory on the island Magerö off the north coast of Norway in 71° 10′ 20″ N., 25° 45′ E., 78 mi. northeast of Hammerfest. Knivskjaerodden, an island a little to the west, is actually a little farther north than the North Cape, and Nordkyn, 45 mi. farther east, is the northern extremity of the mainland (71° 7′ N.). The desolate cape, rising abruptly over 1,000 ft. from the sea, is frequently visited during the summer period of the "midnight sun."

NORTH CAROLINA, popularly known as the "Tar Heel state," is one of the Atlantic coast states of the United States of America, situated between approximately 33° 52′ and 36° 34′ N., and between 75° 27′ and 84° 20′ W. It is bounded north by Virginia, east and southeast by the Atlantic ocean, south and southwest by South Carolina, south also by Georgia, and west and northwest by Tennessee. North Carolina has an extreme length from east to west of 503¼ mi., which is greater than that of any other state east of the Mississippi river. Its total area is 52,712 sq.mi., of which 3,615 sq.mi. are water surface.

Physical Features.—The state lies wholly within the three leading topographical regions of the eastern portion of the United States: the Coastal Plain region, which occupies approximately the eastern half, the Piedmont Plateau region, which occupies about 20,000 sq.mi. in the middle, and the Appalachian region, which occupies about 6,000 sq.mi. in the west. At the eastern extremity of the Coastal Plain region an outer coast line is formed by a chain of long narrow barrier beaches from which project capes Hatteras, Lookout and Fear, whose outlying shoals are known for their dangers to navigation. Between Hatteras and Lookout is Raleigh bay and between Lookout and Fear is Onslow bay; and between the chain of islands and the deeply indented mainland Currituck, Albemarle, Pamlico and other sounds form an extensive area, especially to the northward, of shallow, brackish and almost tideless water. Projecting into these sounds and between the estuaries of rivers flowing into them are extensive tracts of swamp land—the best known of these is Dismal Swamp, which lies mostly in Virginia and is about 30 mi. long and 10 mi. wide. Through most of the Coastal Plain region, which extends inland an average of 150 mi., the country continues very level or only slightly undulating, and rises to the westward at the rate of little more than one foot to the mile. The "Fall Line," the boundary between the Coastal Plain and the Piedmont Plateau, has a very irregular course across North Carolina, but lies in a general southwest direction from the Falls of Roanoke between Halifax and Northampton counties to Anson county on the South Carolina border and marks a rapid increase in elevation of about 200 feet. The Piedmont Plateau region extends from this line to the Blue Ridge Escarpment, toward which its mean elevation increases at the rate of about 3½ ft. to the mile. The southeast face of the Blue Ridge Escarpment, which rises precipitously 1,200–1,500 ft. or more above the Piedmont Plateau, forms the southeast border of North Carolina's Appalachian mountain region, which includes the high Unaka mountain range, segments of which are known by such local names as Iron mountains, Bald mountains and Great Smoky mountains. These ranges reach their culmination in this state, and with a series of more or less interrupted cross ranges constitute the greatest masses of mountains in the east half of the United States. Four peaks along the Blue Ridge have an elevation exceeding 5,000 ft., and 43 peaks in the Unakas and in the several cross ranges exceed 6,000 ft., the highest being Mt. Mitchell or Mitchell Dome (6,684 ft.), of the Black mountains, a short cross range extending north from the Blue Ridge through Yancey county. Another noteworthy peak is Hairy Bear (6,681 ft.), the next highest mountain. The valleys are usually narrow and deep, though few descend to less than 2,000 ft. above the sea.

From the Black mountains, the streams flow as from a ridge pole, some to the Atlantic, others to the Mississippi and finally to the Gulf of Mexico. West of Blue Ridge the Hiwassee, the Little Tennessee and the French Broad rivers flow west or northwest into Tennessee. Farther north are the headwaters of the New river, which finds its way to the Ohio. On the southeast slope of the Blue Ridge rise the Broad, the Catawba and the Yadkin, which first flow northeast, then finding a passage across one of the ridges of the Piedmont Plateau, turn to the south-southeast and across the boundary line into South Carolina, in which state their waters reach the Atlantic. In the northwest part of the Piedmont Plateau region rises the Dan, which in its northeast course crosses the boundary into Virginia, where it becomes a tributary of the Roanoke, in which its waters are returned to North Carolina near the "Fall Line." The other principal rivers—the Cape Fear, the Neuse and the Tar—rise in the northeast part of the Piedmont Plateau region, have their southeast courses wholly within the state, and, with the Roanoke, drain the Coastal Plain region. In the Mountain region and in the Piedmont Plateau region the rivers have numerous falls and rapids which afford a total hydroelectric capacity exceeded only by that in the states of California, New York and Washington, the largest being on the Yadkin, Roanoke and Catawba; and in crossing some of the mountains, especially the Unakas, the streams have carved deep narrow gorges that are much admired for their scenery. In contrast with the rivers of these regions those of the Coastal Plain are sluggish, and toward their mouths expand into wide estuaries.

Climate and Soil.—North Carolina has a climate which varies from that of the southeast corner, which approaches the subtropical, to that of the Mountain region, which is like the medium

continental type, except that the summers are cooler and the rainfall is greater. The mean annual temperature for the state (below an elevation of 4,000 ft.) is about 59° F. For the coastal plain region it is 62° F.; for the Piedmont plateau region, 60° F.; for the mountain region, 55° F.; for Southport, in the southeast corner of the state, 64° F.; and for Highlands, at an elevation of 3,817 ft. in the southwest corner, 50° F. Extremes have ranged from −19° F. at Highlands to 107° F. at Chapel Hill, Orange county. The average precipitation for the state is about 50 in. a year, nearly all of it in the form of rain. For the coastal plain region it is 48 in.; for the Piedmont plateau region 47 in.; and for the mountain region 54 in. On the east slope of some of the mountains the rainfall is exceedingly heavy. The winds are variable and seldom violent, except along the coast during the subtropical storms of late summer and early autumn.

On the coastal plain the soil is generally sandy, but in nearly all parts of this region more or less marl abounds; south of the Neuse river the soil is mostly a loose sand, north of it there is more loam on the uplands, and in the lowlands the soil is usually compact with clay, silt or peat; toward the western border of the region the sand becomes coarser and some gravel is mixed with it. The entire Piedmont region is underlain by crystalline rocks, such as granite and schists. The soils are, for the most part, red sandy loams and clay loams, gravelly and sandy in spots.

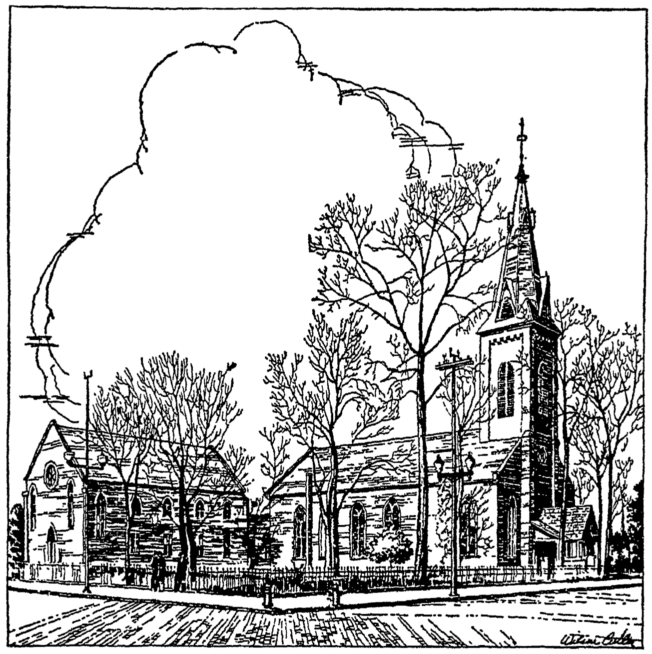
History.—The history of North Carolina may be divided into four main periods: the period of discovery and early colonization (1524–1663); the period of proprietary rule (1663–1729); the period of royal rule (1729–76); and the period of statehood (from 1776).

It is known that some of the early French and Spanish explorers visited the coast of North Carolina, but no serious attempt was made by Europeans to establish a settlement until near the close of the 16th century. After receiving from Queen Elizabeth a patent for colonization in the new world, Sir Walter Raleigh, in April 1584, sent Philip Amadas, or Amidas (1550–1618), and Arthur Barlowe (*c.* 1550–*c.* 1620) to discover a suitable site for a colony in the region bordering on Florida. They returned in September with a glowing account of what is now the coast of North Carolina, and on April 9, 1585, a colony of about 108 men under Ralph Lane (*c.* 1530–1603) sailed from Plymouth in a fleet of seven small vessels commanded by Sir Richard Grenville. The colony was established at the north end of Roanoke Island on Aug. 17 and about a week later Grenville returned to England. Threatened with famine and with destruction from hostile Indians, the entire colony left for England June 19, 1586, on Sir Francis Drake's fleet. Only a few days after their departure Sir Richard Grenville arrived with supplies and more colonists, 15 of whom remained when he sailed away. Although greatly disappointed at the return of the first colony, Raleigh dispatched another company, consisting of 121 persons under John White, with instructions to remove the plantation to the shore of Chesapeake bay. They arrived at Roanoke Island July 22, 1587, and were forced to remain there by the refusal of the sailors to carry them farther. Of the 15 persons left by Grenville not one was found alive. White's granddaughter, Virginia Dare (b. Aug. 18, 1587), was the first English child born in America.

White soon returned to England for supplies, and having been detained there until 1590 he found upon his return no trace of the colony except the word "Croatoan" carved on a tree; hence the colony was thought to have gone to friendly Indians of that name.

In 1663 Charles II granted the territory between the 31st and 36th parallel and extending from sea to sea, to the earl of Clarendon (1609–74), the duke of Albemarle (1608–70), and six other favourites. By a second charter issued in 1665 the limits were extended to 29° and 36° 30′. The first permanent English settlement in Carolina was on the Chowan river about 1653 by people from Virginia. In 1663 the settled region north of Albemarle sound was organized as Albemarle county. Settlers began to move into the Neuse-Pamlico region soon after 1700 and into the lower Cape Fear about 1725. The upper Cape Fear valley was settled largely by Scottish Highlanders; the piedmont region, by Scotch-Irish and Germans, following up the valleys from Pennsylvania. The colony grew rapidly and at the close of the colonial period (1776) the population numbered approximately 300,000, including about 40,000 Negroes. Economic advantages seem to have been the chief motives of colonization. The proprietary period (1663–1729) was one of slow growth and turbulence. Several governors or deputy governors were driven from office between 1674 and 1712, and there were two uprisings which have been deemed worthy of the term rebellion. A war with the Tuscarora Indians, in 1711–13, resulted in the defeat of the Indians and the removal of the greater part of the tribe to New York, where they became the sixth nation of the Iroquois confederacy. Albemarle as a colony ended in 1689 and in 1712 became the separate colony of North Carolina.

In 1729 an act was passed by parliament establishing an agreement with seven of the proprietors for the surrender of their claims to Carolina. They were allowed £17,500 for their rights and £5,000 for arrears of quit rents. Lord Carteret, afterward earl of Granville, the eighth proprietor, refused to sell, and a strip of land in North Carolina lying between lat. 35° 34′ and the Virginia line (36° 30′) known as the Granville district, was laid off as his one-eighth share of Carolina. The political history during the royal period (in which the colony developed rapidly) is, like that of other colonies, the story of a constant struggle between representatives of the people and the representatives of the crown. There were disputes over questions of government, of commerce, of finance and of religion. In 1765–66 armed patriots prevented the enforcement of the Stamp act in the colony. In the "back country" extortionate fees, excessive taxes, and the oppressive manner of collecting them brought about a popular uprising, known as the Regulation. Violence followed the refusal to pay taxes, and in Sept. 1768 Gov. William Tryon was forced to lead a military expedition against the Regulators. They, however, were not prepared to withstand the governor's forces and submitted without bloodshed. New outbreaks in the fall of 1770 provoked the second military expedition of the governor, and on May 16, 1771, with a force of about 1,000 men and officers, he met about twice that number of Regulators on the banks of the Alamance, where, after two years of fighting, with losses on each side nearly equal, the undisciplined Regulators were routed. About 15 were taken prisoners, and of these seven were executed.



BY COURTESY OF THE NEW BERN CHAMBER OF COMMERCE

CHRIST CHURCH, PROTESTANT EPISCOPAL, NEW BERN, N.C.

The first provincial congress met at New Bern Aug. 25, 1774, and elected delegates to the first Continental Congress. A second provincial congress met in April 1775, and in the next month

Gov. Josiah Martin sought safety in flight. A committee representing the militia companies of Mecklenburg county, on May 31, 1775, passed a series of resolutions which declared that the royal commissions in the several colonies were null and void, that the constitution of each colony was wholly suspended, and that the legislative and executive powers of each colony were vested in its provincial congress subject to the direction of the Continental Congress; and the resolutions requested the inhabitants of the county to form a military and civil organization independent of the crown of Great Britain which should operate until the provincial congress should otherwise provide or the British parliament should "resign its unjust and arbitrary pretensions with respect to America." The Mecklenburg declaration of independence, which it is alleged was passed on May 20 by the same committee, is of doubtful authenticity though the date appears on the state flag by legislative act. The patriot victory at Moore's Creek Feb. 27, 1776, thwarted Gov. Martin's effort to re-establish royal authority.

The first sanction of independence by any colony was the Halifax resolution adopted by the fourth provincial congress on April 12, 1776, and the same body immediately proceeded to the consideration of a new and permanent form of government. Their labours ended, however, in another provincial government by a council of safety, and the drafting of North Carolina's first state constitution was left to a constitutional convention which assembled on Nov. 12, at Halifax.

North Carolinians fought under George Washington at Brandywine and Monmouth and played a still more important part in the Southern campaigns of 1778–81. The state was twice invaded, in 1776 and in 1780–81. The two chief battles fought upon its soil were Moore's Creek, Feb. 27, 1776, and Guilford Court House, March 15, 1781.

North Carolina sent delegates to the Philadelphia constitutional convention of 1787, but the state convention, at Hillsboro, called to ratify the constitution for North Carolina, did not meet until July 21, 1788, when ten states had already ratified. The document was strongly opposed because it contained no bill of rights and on the ground that it would provide for such a strong central government that the state governments would ultimately be sacrificed. At the conclusion of the debate the convention by a vote of 184 to 84 declared itself unwilling to ratify the constitution until a bill of rights had been added and it had been amended in several other particulars so as to guarantee certain powers to the states. But a second convention met at Fayetteville in Nov. 1789 and the constitution was speedily ratified (on the 21st) by a vote of 194 to 77. Also in 1789 the University of North Carolina was chartered and the state ceded its western lands (Tennessee) to the United States.

The period from 1790 to 1835 was marked by a contest between the dominant eastern and the western counties. The west urged that equal county representation in the legislature be replaced by representation based on population. This was stubbornly resisted, and the west assumed a threatening attitude as the east opposed its projects for internal improvements for which the west had the greater need. In 1823 the west called an extralegal convention to meet at Raleigh, and delegates from 24 of the 28 western counties responded, but a lack of agreement over the counting of slaves as well as whites as a basis of representation caused little to be accomplished. Finally in Jan. 1835 the legislature passed a bill for submitting the question of calling a constitutional convention legally to all the voters of the state. When the popular vote was taken, in the following April, every eastern county gave a majority against the convention, but the west voted strongly for it and carried the election with a total majority in the state of 5,856 votes. In the convention, the east made some concessions: such as the popular election of the governor, the disfranchisement of free Negroes, the choosing of senators from districts according to public taxes, and the apportioning of commoners to counties according to population based on the federal ratio. The electorate gave its approval to the revision by a vote of 26,771 to 21,606, and with this the agitation over representation ceased.

The period 1835–60 was an age of progress in the state. After the constitutional reforms of 1835 broke the political dominance of the east, the new progressive Whig party controlled the state government from 1836 to 1850 and adopted the program of public education and internal improvements proposed by Archibald D. Murphey 20 years earlier. The Democratic party, generally dominated by the planter class, grew weary of successive defeats because of its negative program of opposition to Whig policies. It captured control of the state in 1850 because of its able young leaders, its advocacy of free suffrage and the weakening of the Whig party as a result of the slavery controversy and the failure of the Whigs to press forward with the progressive program which they had launched.

The Democratic party controlled the state from 1850 to 1860. Once in power it gradually adopted and extended the progressive program inaugurated by the Whigs. In the generation before 1860 the state government completed a new capitol (1840), gave millions of dollars of aid for building plank roads and a 900-mi. network of railroads, established (1839–40) and provided the major financial support for a state system of free public elementary schools for white children, established institutions for the care of the blind, deaf and insane, expanded the state system of taxation, and made some liberal changes in the criminal law and in the legal status of women. The state university grew rapidly; many private academies for women and men were founded as well as colleges for women; and the leading denominations established colleges for men. Newspapers increased in number and circulation. The period was characterized by economic development and prosperity. There were improvements in the methods of farming and increases in crop production (particularly cotton and tobacco) and significant beginnings of manufacturing. This age of progress was brought to an end by the Civil War.

The fundamental points of difference between North Carolina and South Carolina were exemplified in the slavery conflict. South Carolina led the extreme radical element in the South and was the first state to secede. North Carolina held back, worked for a compromise, sent delegates to the Washington peace convention in Feb. 1861, and did not secede until May 20, 1861, after President Lincoln's call for troops to preserve the union. Liberal support was given to the Confederacy, both in men and supplies, but Gov. Zebulon B. Vance, one of the ablest of the Southern war governors, engaged in acrimonious controversies with Pres. Jefferson Davis, contending that the general government of the Confederacy was encroaching upon the prerogatives of the separate states. The northwestern part of the state was captured by the Federals in 1862 and held throughout the war. Wilmington was captured in Feb. 1865; Gen. Sherman's army crossed the southern boundary in March; a battle was fought at Bentonville, March 19–21; Raleigh was entered on April 13; and the Confederates under Gen. Joseph E. Johnston surrendered near Durham station, in Durham county, on the 26th.

Reconstruction was a costly experience there as in other Southern states. Jonathan Worth (1802–69), elected governor under the presidential plan in 1865, was an honest and capable official, but the government established in accordance with the views of congress in 1868 was corrupt, inefficient and tyrannical. Carpetbaggers, Negroes and unscrupulous native whites, known as scalawags, were in control of affairs, while many people of wealth, refinement and education were disfranchised. They formed the Republican party, wrote and adopted the constitution of 1868, and captured control of the state government. Gov. William Woods Holden (1818–92; governor 1868–70) was so unpopular and tyrannical that he was impeached by the legislature in Dec. 1870. Under his successor, Tod R. Caldwell (1818–74), there was some improvement in the condition of affairs, and in 1875 a constitutional convention, in session at Raleigh, with the Democrats slightly in the majority, amended the constitution, their work being ratified by the people at the state election in 1875. The native white element completely regained possession of the government in the following year, when the Democrats came into office under Gov. Zebulon B. Vance. An interesting feature in the political history of the state was the rise and fall of the Peo-

ple's party. The hard times which followed the panic of 1893 enabled it, in alliance with the Republicans, to carry the state in 1894. The race question dominated the elections of 1898 and 1900, when the Democrats came again into power; and in 1900 a constitutional amendment virtually disfranchising Negroes was adopted.

With the accession of Gov. Charles B. Aycock in 1901, a new era of prosperity began which continued until the decade following the depression of 1929. The Democratic party was in continuous control of the state after 1901. Major activities of the government were in the fields of public education, public health, and highway construction. The state government extended tax relief to the counties by taking over almost the entire cost of road construction and maintenance in 1931 and of the public schools in 1933. In 1949 the state launched a $200,000,000-program for paving rural roads.

In the 1940s a vast medical care program was launched providing for a four-year medical school and hospital at the state university and hospitals throughout the state. After 1900 there was vast expansion in agriculture, particularly cotton and tobacco. Tobacco superseded cotton as the state's major crop in the 1920s; about two-thirds of the nation's crop of flue-cured tobacco is grown in the state.

Rapid industrialization, followed by urbanization, made manufacturing the chief source of the state's wealth and gave it pre-eminence in the nation in tobacco and high rank in textile and furniture manufacture. In national politics the state went Republican for the only time since Reconstruction when Herbert Hoover defeated Alfred E. Smith by a majority of 62,000 in the contest for president in 1928, but in 1932 the state returned to the ranks of the Democratic "solid south." (X.)

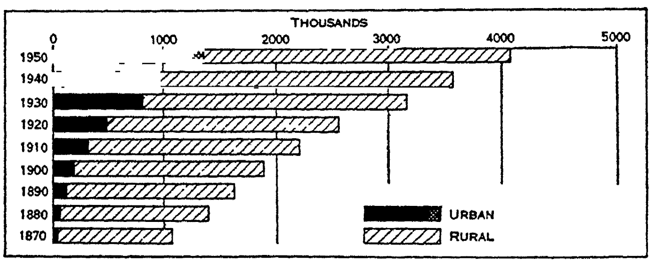
Government.—North Carolina has been governed under the charters of 1663 and 1665 (1663–1729), under commissions and instructions from the crown (1729–76), and under the state constitutions of Dec. 1776 and of April 1868, with numerous amendments. The present constitution, as amended, prescribes that no convention of the people of the state may be called by the legislature unless by the concurrence of two-thirds of all the members of each house, followed by an affirmative vote of a majority of the electors voting on the question; and that an amendment to the constitution may be adopted also by a three-fifths vote of each house, followed by an affirmative vote of the majority of electors voting on the question. The suffrage provisions containing the famous "grandfather clause" (in article vi, section 4), were adopted in the form of a constitutional amendment, ratified in Aug. 1900, and in effect July 1, 1902. Since Dec. 1, 1908, all new applicants otherwise qualified may place their names on the voting register, provided they can read and write any section of the constitution in the English language.

The governor has acquired extensive power over appointments and state fiscal policy. He is elected by popular vote for four years, and cannot succeed himself in office. His power is limited by a council of state, a relic of colonial days. This body is not, however, a special board, as in Maine, New Hampshire and Massachusetts, but a kind of administrative cabinet consisting of the secretary of state, the auditor, the treasurer, the superintendent of public instruction, the commissioner of labour, the commissioner of agriculture and the commissioner of insurance, advising the governor in the administration of his office. Judges and heads of the state departments are elected, and in most instances in which the governor appoints to office the confirmation of the senate is necessary. Furthermore, in North Carolina the governor has no veto power. In addition to the executive officials mentioned above there are a lieutenant governor and attorney general, each elected for a term of four years. Other executive officials are appointed by the governor.

Sessions of the general assembly are held biennially, beginning on the Wednesday after the first Monday in January in odd-numbered years. The senate is composed of 50 members elected biennially from 33 senatorial districts, and the house of representatives of 120, elected biennially and chosen by counties according to their population, each county having at least one representative, no matter how small its population. The pay for both senators and representatives is $600 for their term of office, but if an extra session is called they also receive $8 per day for a period not exceeding 20 days.

There is a supreme court consisting of a chief justice and six associates, elected by popular vote for eight years, and superior or circuit courts, composed of 21 judges elected by the people in each of 21 districts for a term of eight years. Minor civil and criminal cases are tried before a justice of the peace or municipal judge. The county officials are the sheriff, a coroner, a treasurer, a registrar of deeds, a surveyor and a board of commissioners, elected by the people; a clerk of the court elected for four years; a county board of education, elected by the legislature for two years; and a superintendent of schools and a superintendent of public welfare, appointed for a term of two years.

Population.—The population of North Carolina in 1790 was 393,751; in 1830 it was 737,987; in 1870, 1,071,361; in 1910,



BY COURTESY OF THE U S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NORTH CAROLINA: 1870 TO 1950
The crosshatched part of the 1950 bar represents the population of the additional areas counted as urban under the new 1950 definition

2,206,287; in 1940, 3,571,623; and in 1950, 4,061,929. This last figure represented an increase of 13.7% over the population in 1940.

The population per square mile in 1950 was 82.7, as compared with 72.7 in 1940, and with 50.7 for the U.S. in 1950.

Of the 1950 population, 1,238,193, or 30.5%, lived in incorporated places of 2,500 or more, as compared with 27.3% in 1940 when these places constituted the urban area. The entire urban population, under a new definition set up for 1950, which included also the thickly settled suburban area, or "urban fringe," adjacent to the 5 cities which had 50,000 inhabitants or more in 1940, and 18 unincorporated places of 2,500 or more outside this fringe, amounted to 1,368,101, or 33.5% of the state total.

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40
The state.	4,061,929	3,571,623	3,170,276	13.7	12.7

Asheville	53,000	51,310	50,193	3 3	2.2

*Final figures for 1950 based on *new* definition *See* comment in text.

The number of occupied dwelling units (or households) in 1950 was approximately 1,019,000, as compared with 790,000 in 1940. The average population per household had declined from 4.5 in 1940 to 4.0 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 73.0% native white; 0.4% foreign-born white; and 26.6% nonwhite, nearly all Negro. There were 99.8 males per 100 females in the native white population, and 95.4 in the Negro population; 5.6% of the population was 65 years old or over; and 55.0% of the population 14 years old and over was in the labour force. Of the total number of employed males, 31.1% was engaged in agriculture, 8.1% in construction, 26.5% in manufacturing and 18.0% in transportation and trade.

Finances.—North Carolina was one of the few states in the union in the 1940s that had no state tax on property. The total

of the state's general fund revenues for the fiscal year ending June 30, 1948, was $126,205,698; the principal sources being sales ($39,333,608), income ($59,583,846), franchise ($10,053,970), licence ($3,944,444), beverages ($6,471,703), intangibles ($591,572) and inheritance ($1,719,878) taxes. The average rate of county taxation in 1948 was about $10 per $1,000 of valuation on assessed property values of $3,705,712,198. The chief sources of revenue of the state highway fund were gasoline taxes ($40,699,063), automobile and truck licences ($12,415,110), and a contribution from the federal government ($11,020,720). General fund disbursements for the fiscal year ending June 30, 1948, were $92,018,238. Of this amount the chief disbursements were for public schools ($62,655,102), colleges ($5,789,044), general administration and governmental costs ($6,427,541), and maintenance of charitable and correctional institutions ($7,485,872). Of the special fund disbursements the greater were for the state highway and public works commission ($63,327,775), and interest and redemption of state bonds ($7,278,114). The total indebtedness of the state on June 30, 1948, was $79,359,500 in bonds. Of this bonded debt $36,306,000 was for highway construction, $38,803,500 for educational and charitable institution improvement, $1,750,000 for public school building bonds and $2,500,000 for World War I Veterans' Loan bonds. In 1949 the legislature and a popular referendum authorized the issue of $200,000,000 of bonds for the construction of rural roads, and $25,000,000 to aid the counties in the construction and repair of schoolhouses. In 1945 the legislature set aside from the surplus a sum adequate to retire all the general fund indebtedness at that time.

Education.—The public school system of North Carolina made remarkable and well-rounded progress after 1900. The total school expenditures increased from $1,248,157 in 1901 to $39,626,390 in 1929, or from $2.87 per capita of enrolment to $42.53. As a result of the depression, public school expenditures dropped to $19,239,000 in 1933 but rose to $84,255,969 in 1947–48. In 1901 there were 8,320 teachers and 435,184 enrolled pupils as compared with 26,618 teachers and 855,852 pupils in 1947–48. The high school enrolment increased from 63,499 in 1923–24 to 116,937 in 1929–30 and 164,432 in 1947–48. About three-fourths of the operating costs of the state-wide nine-month school system, excluding federal funds, was contributed by the state government. Of the total public school enrolment in 1947–48, 595,812 were white and 260,041 were Negroes. The length of school term and salary scale for teachers are identical for whites and Negroes. In fact the average Negro teacher's salary was higher because a larger percentage of Negro teachers held Class A certificates—90.5% of the Negroes as compared with 79.2% of the whites in 1948–49. The average annual salaries of high and elementary school teachers in 1947–48 were $2,029 and $2,000 respectively. From 1917, with the aid of federal funds, the state supported vocational education in the public schools. In 1947–48 there were 26,274 pupils taking instruction in agriculture and 27,738 studying home economics. In 1949 the state extended $50,000,000 aid to the counties for the construction and repair of public schools. The total value of public school property in 1947–48 was $166,067,207, and the state transported 348,100 pupils in buses to the consolidated public schools.

Chief among the state institutions of higher learning is the University of North Carolina at Chapel Hill, chartered in 1789 and opened in 1795, one of the oldest state universities in the country and the first to begin operation in the south. In 1949–50 it had an average enrolment of 6,965 students during the three quarters of the regular academic year. Other branches of the consolidated university are North Carolina State College of Agriculture and Engineering at Raleigh and Woman's College of the University of North Carolina at Greensboro. Other state schools are East Carolina Teachers college at Greenville, Western Carolina Teachers college at Cullowhee and the Appalachian State Teachers college at Boone. State-supported Negro institutions include the Negro Agricultural and Technical college at Greensboro, the Winston-Salem Teachers college at Winston-Salem, North Carolina College at Durham, and normal schools at Fayetteville and Elizabeth City. A school for the Cherokee Indians of Robeson county is located at Pembroke. Among the nonstate-supported institutions of higher education Duke university, formerly Trinity college, at Durham, is the greatest. It received from James B. Duke the sum of $6,000,000 for building and an endowment fund estimated to amount to anywhere from $80,000,000 to $100,000,000, one of the largest foundations for education and hospitalization in the world. Well-known sectarian schools are Wake Forest college at Wake Forest; Davidson college at Davidson; Greensboro college for women at Greensboro; Guilford college near Greensboro; Lenoir Rhyne college at Hickory; Catawba college at Salisbury; Meredith college at Raleigh; Belmont Abbey college at Belmont; Elon college at Elon; and Atlantic Christian college at Wilson. Institutions for Negroes include Shaw university at Raleigh, Johnson C. Smith university at Charlotte, Livingstone college at Salisbury and St. Augustine's college at Raleigh.

Charities and Corrections.—The chief state-supported institutions in 1950 consisted of hospitals for the white insane at Raleigh and Morganton and a hospital for Negro insane at Goldsboro, the Caswell Training school for mental defectives at Kinston, the North Carolina Orthopaedic hospital for crippled children at Gastonia, the North Carolina hospital for the treatment of spastic children, sanatoriums for the treatment of tuberculosis at Black Mountain, Sanatorium and Wilson; the Stonewall Jackson Training school for delinquent white boys at Concord, the Eastern Carolina Industrial Training school for delinquent white boys at Rocky Mount, the Morrison Training school for delinquent Negro boys at Hoffman, the Training School for Negro Girls at Rocky Mount, the North Carolina State Home and Industrial School for Girls and Women at Samarcand, and the state prison at Raleigh.

Agriculture.—North Carolina in 1947 ranked fourth among the states in the cash income from crops, the total cash income from crops being $624,310,000; from livestock and livestock products, $135,150,000; and from government payments, $8,056,000. The value of products for home consumption was $186,516,000. In that year the state ranked first in the production of tobacco (two-fifths of the nation's crop) and lespedeza seed, and third in peanuts. The principal crops in 1947, their acreage yields and values, were as follows: tobacco, 792,600 ac., 907,181,000 lb., $381,016,000; cotton, 654,000 ac., 452,000 bales, $73,653,400; Indian corn, 2,204,000 ac., 68,733,000 bu., $137,546,000; all hay, 1,258,000 ac., 1,250,000 tons, $35,500,000; sweet potatoes, 59,000 ac., 6,785,000 bu., $15,994,850; wheat, 508,000 ac., 8,194,000 bu., $19,583,660; potatoes, 68,000 ac., 8,840,000 bu., $13,855,600; oats, 508,000 ac., 11,387,000 bu., $11,728,600; rye, 145,000 ac., 336,000 bu., $7,560,000; barley, 53,000 ac., 1,204,000 bu., $1,938,440.

In the production of vegetables and fruits the state ranks high. In 1947 the orchards yielded 768,000 bu. of apples, 2,905,000 bu. of peaches and 127,000 bu. of pears. The vineyards of the state produced 5,600 tons of grapes. The approximate values of these crops in 1947 were: apples, $1,689,600; peaches, $4,212,250; pears, $190,500; grapes, $1,008,000.

The livestock on the farms of North Carolina in 1948 consisted of 677,000 cattle, of which 376,000 were for dairy purposes; 1,181,000 swine; 269,000 mules, 94,000 horses and 37,000 sheep. The production of milk was 177,790,700 gal., and egg production was 77,916,666 dozen.

The average size of farms in 1945 was 64.8 ac. as compared with 67.7 ac. in 1940, and the farm acreage was 18,617,932 as compared with 18,845,338. In the same period the number of farms increased from 278,276 to 287,412. Of the total number of farmers in 1945, 213,139 were whites and 74,273 were nonwhites, chiefly Negroes. The greater part of the nonwhite farmers (54,414) were tenants. The total number of tenants was 122,577 or 42.3% of the farmers as compared with 44.4% in 1940. In 1945 the total value of farm lands and buildings was $1,002,983,012, and the total farm population was 1,311,223 as compared with 1,623,481 in 1940.

Forests and Fisheries.—Woods and forests cover more than

half the area of North Carolina. In 1947, 4,588 active sawmills produced 1,539,656,000 bd.ft. of sawed lumber as compared with 1,042,122,000 bd.ft. in 1939. Of the 1947 production, which ranked fifth among the states, 1,173,562,000 bd.ft. were classified as softwood, chiefly yellow pine (1,118,053,000 bd.ft.), white pine (11,081,000 bd.ft.), cypress (25,778,000 bd.ft.), and hemlock (13,041,000 bd.ft.); and 366,094,000 bd.ft. as hardwood, principally oak (176,078,000 bd.ft.), tupelo (46,388,000 bd.ft.) and yellow poplar (70,449,000 bd.ft.). Other species of some importance were maple, cedar, red gum and ash. The early production of rosin, turpentine and tar from the long-leaf pine forests of the coastal plain caused North Carolina to be popularly called the "Tar Heel state." Forest resources were the basis for the manufacture of furniture and lumber and timber products.

In the sounds along the coast, in the lower courses of the rivers that flow into them, and along the outer shores, fishing is an important industry. In 1946–48 the total value of the food fish, shrimp, menhaden and shellfish taken in the waters of the state was $20,870,000.

Minerals.—During the first half of the 19th century North Carolina was a mining state of the first importance, but in the first half of the 20th century it ranked low (31st to 37th) among the states in mineral production. The total value of the mineral products in 1947 was $23,699,000. The principal minerals produced were stone ($7,561,167), clay products ($8,314,976), sand and gravel ($2,956,800), talc ($1,186,463), feldspar ($1,081,514) and mica ($928,361). North Carolina's annual production of crude feldspar is about one-third of the total quantity of that mineral produced in the United States. It is mined chiefly in Mitchell, Yancey and Avery counties. The state ranked first in the production of mica, found in the southwestern portion of the mountain region. Granite, suitable for building stones and paving blocks, is found in most parts of the state west of the fall line. Talc is found in Swain, Yancey, Mitchell and Avery counties.

Manufactures.—North Carolina in 1947 ranked second to Texas in the south and thirteenth among the states of the union in the total value of $1,646,673,000 added by its 5,322 establishments, employing 350,207 workers at total wages of $641,966,000. This industrial pre-eminence had been gained since 1880. Industrial leadership in the manufacture of cotton goods, tobacco products and furniture was achieved by an abundant supply of raw materials, favourable climate, a reliable supply of native labour and cheap hydroelectric power. The electric power production in 1948 was 9,353,600,000 kw.hr. The total value of the manufactured products of the state was $217,000,000 in 1910; $944,000,000 in 1920; $1,312,000,000 in 1930; $1,421,000,000 in 1939; and an estimated $3,091,000,000 in 1948. The value added by manufacture in 1939 was $544,181,000 as compared with $1,646,673,000 in 1947.

The following table shows the principal industries in 1947, the number of establishments, the average number of wage earners, and the value added by manufacture:

Industry	Number of establishments	Wage earners	Value added by manufacture
Textile mill products	939	200,880	$846,280,000
Yarn and thread, except wool	223	55,378	209,715,000
Cotton and rayon fabrics	149	83,423	405,821,000
Woollens and worsteds	13	5,398	23,212,000
Tobacco	69	29,428	257,986,000
Cigarettes	5	12,980	197,576,000
Furniture and fixtures	372	25,939	102,447,000
Household furniture	337	24,228	96,272,000
Lumber and lumber products	1,864	29,730	84,127,000
Food and kindred products	728	11,574	78,430,000
Chemicals and allied products	188	7,467	58,607,000
Paper and allied products	47	6,446	47,395,000
Apparel and related products	144	15,743	43,852,000
Printed and publishing	363	3,433	25,369,000

Gaston county, with the industry centred chiefly at Gastonia and Belmont, was the leading textile county, but Alamance, Guilford, Cabarrus and Mecklenburg were also important textile producers. Winston-Salem, followed by Durham, was the chief centre of tobacco manufacture, but the industry was important in Reidsville, Greensboro and Statesville. The chief centre of the furniture industry was High Point, but other important centres were Winston-Salem, Thomasville, Hickory, Lexington, Mount Airy, Salisbury and Lenoir. In value added by manufacture in 1947, Forsyth county led with $176,392,000, followed by Guilford, $125,140,000; Gaston, $120,211,000; and Cabarrus, $105,642,000.

Transportation.—Railway building was begun in the state in 1836, and the Raleigh and Gaston line opened in 1840. By 1860 nearly 900 mi. had been built with state aid. Great expansion occurred after 1880. The steam railway mileage in 1950 was 4,519 as compared with 4,596 in 1940. After 1920 great progress was made in developing a system of highways. The state highway and public works commission in 1950 maintained 11,534 mi. of state highways and 52,887 mi. of county roads, of which 17,875 mi. were hard-surfaced. There were in operation 870 mi. of city bus routes and 11,912 mi. of passenger bus routes in 1950. There were 526,749 telephones in use in the state. The total motor vehicle registration in 1950 exceeded 1,100,000. Wilmington, the deepwater port had imports of $16,000,000 and exports of $84,000,000 in 1944.

Bibliography.—The best bibliographies are S. B. Weeks, *A Bibliography of the Historical Literature of North Carolina* (1895); F. B. Laney and K. H. Wood, *Bibliography of North Carolina Geology, Mineralogy and Geography* (1909); Douglas C. McMurtrie, *Eighteenth Century North Carolina Imprints, 1749–1800* (1938). Of primary source materials, there are extensive manuscript collections of historical records and public archives in the State Department of Archives and History at Raleigh, Duke University library at Durham and University of North Carolina library at Chapel Hill. There are published guides to these collections. The chief published sources are: *The Colonial and State Records of North Carolina*, 30 vol. (1886–1914); the *Publications* of the North Carolina Historical Commission; H. T. Lefler (ed.), *North Carolina History Told by Contemporaries* (1934); reports and publications of various state departments and agencies, and U.S. census reports and government documents.

Of secondary sources the best general histories are: R. D. W. Connor, W. K. Boyd, J. G. de R. Hamilton, *History of North Carolina*, 3 vol. of history and 3 vol. of biography (1919); S. A. Ashe, *History of North Carolina*, 2 vol. (1908–25); R. D. W. Connor, *North Carolina: Rebuilding an Ancient Commonwealth, 1584–1925*, 2 vol. of history and 2 vol. of biography (1929); Archibald Henderson, *The Old North State and The New*, 2 vol. (1941). Other valuable works of broad scope are: G. G. Johnson, *Ante-bellum North Carolina: a Social History* (1937); and S. H. Hobbs, Jr., *North Carolina, Economic and Social* (1930). Among the best monographs are: J. S. Bassett, *Constitutional Beginnings of North Carolina, 1663–1729* (1894), *Slavery and Servitude in the Colony of North Carolina* (1896) and *The Regulators of North Carolina, 1765–1771* (1895); C. L. Raper, *North Carolina: A Study in English Colonial Government* (1904); E. W. Sikes, *The Transition of North Carolina from Colony to Commonwealth* (1898); S. B. Weeks, *The Religious Development in the Province of North Carolina* (1892), *Church and State in North Carolina* (1893) and *Southern Quakers and Slavery* (1896); Coralie Parker, *History of Taxation in North Carolina During the Colonial Period, 1663–1776* (1928); C. C. Crittenden, *The Commerce of North Carolina, 1763–1789* (1936); W. H. Hoyt, *The Mecklenburg Declaration of Independence* (1907); H. M. Wagstaff, *State Rights and Political Parties in North Carolina, 1776–1861* (1906); Louise I. Trenholme, *The Ratification of the Federal Constitution in North Carolina* (1932); D. H. Gilpatrick, *Jeffersonian Democracy in North Carolina, 1789–1816* (1931); A. R. Newsome, *The Presidential Election of 1824 in North Carolina* (1939); W. E. Dodd, *The Life of Nathaniel Macon* (1903); J. S. Bassett, *Slavery in the State of North Carolina* (1899); R. H. Taylor, *Slaveholding in North Carolina; an Economic View* (1926); J. G. de R. Hamilton, *Party Politics in North Carolina, 1835–1860* (1916); C. C. Norton, *The Democratic Party in Ante-bellum North Carolina, 1835–1861* (1930); C. K. Brown, *A State Movement in Railroad Development* (1928) and *The State Highway System of North Carolina* (1931); J. C. Sitterson, *The Secession Movement in North Carolina* (1939); D. H. Hill, *Bethel to Sharpsburg*, 2 vol (1926); J. G. de R. Hamilton, *Reconstruction in North Carolina* (1914); Holland Thompson, *From the Cotton Field to the Cotton Mill* (1906); W. K. Boyd, *The Story of Durham, City of the New South* (1925); Josephus Daniels, *Tar Heel Editor* (1939) and *Editor in Politics* (1941); E. W. Knight, *Public School Education in North Carolina* (1916); P. W. Wager, *County Government and Administration in North Carolina* (1928); J. H. Franklin, *The Free Negro in North Carolina, 1790–1860* (1943); Stuart Noblin, *Leonidas LaFayette Polk, Agrarian Crusader* (1949); A. L. Brooks, *Walter Clark, Fighting Judge* (1944). The best historical articles may be found in the *North Carolina Historical Review* (1924 *et seq.*); the *James Sprunt Studies* (1900 *et seq.*); *Historical Papers* of the Trinity College Historical Society (1897 *et seq.*). (A. R. N.)

NORTH CHICAGO, a manufacturing city of Lake county, Illinois, U.S.A., on Lake Michigan, 35 mi. N. by W. of Chicago, between Waukegan (on the north) and the Great Lakes naval

Training station. It is served by the Chicago and North Western, the Chicago, North Shore and Milwaukee, and the Elgin, Joliet and Eastern railways. Pop. 8,700 in 1950, 8,465 in 1940 and 8,466 in 1930 by federal census.

NORTHCLIFFE, ALFRED CHARLES WILLIAM HARMSWORTH (1865–1922), VISCOUNT, British newspaper proprietor, was born on July 15, 1865 at Chapelizod, Dublin, the eldest of a family of fourteen. His father, Alfred Harmsworth (1837–1889), descended from an old Hampshire family, was a barrister-at-law of the Middle Temple. His mother, Geraldine Mary, who died Aug. 29, 1925, a woman of remarkable intellect and strong character, was a daughter of William Maffett.

Of the seven sons, the two eldest, Alfred and Harold (1868–1940), became members of the house of lords as Lord Northcliffe and Lord Rothermere respectively; the third, Cecil Bisshopp (1869–1948), who in 1939 was made 1st Baron Harmsworth of Egham, became in 1915 under secretary for home affairs and in 1919 under secretary for foreign affairs, having sat in the house of commons as a Liberal from 1906 to 1922; the fourth, Robert Leicester (1870–1937), who was created a baronet in 1918, entered the house of commons in 1900 as Liberal M.P. for Caithness, a seat which he retained till 1922. The other three sons were Hildebrand Aubrey (1872–1929), from 1901 to 1904 editor of *The New Liberal Review;* St. John (b. 1876), the creator of the Perrier mineral water business; and Vyvyan George (b. 1881).

Early Journalism.—The Harmsworths moved to London in the year 1867, and at Henley House school, West Hampstead, the boy Harmsworth started in 1878 the first of his journalistic adventures, a school magazine. This was originally issued in ms. but was afterwards printed and sometimes set up by himself in his spare time. At 15 he did some work for Mr. Jealous, then editor of *The Hampstead and Highgate Express.* As secretary and companion to one of Lord Lilford's sons, he travelled extensively in Europe. On his return to London he became assistant editor of *Youth* and contributed articles to *The Morning Post,* and to the *St. James's Gazette.*

But his health temporarily broke down in 1884. Ordered to live out of London, he went to Coventry in 1885 and worked for the firm of Iliffe and Sons, owners of many publications. With them he remained till 1886, and he then went back to London and joined a general publishing business. Among other ventures he started on June 16, 1888 *Answers to Correspondents,* a weekly periodical intended to be a more popular form of *Notes and Queries.* As *Answers* it laid the foundation of what eventually became the largest periodical publishing business in the world, the Amalgamated Press. Alfred Harmsworth had already been joined by his second brother, Harold (*see* ROTHERMERE, HAROLD SIDNEY HARMSWORTH). The two brothers revolutionized the current methods of periodical journalism. The profits of the accumulated publications soon soared to £50,000 a year. In the next few years Alfred Harmsworth travelled much in Europe, India, Africa, Canada and the United States. On April 11, 1888, he had married Mary Elizabeth, daughter of Robert Milner, a West Indian merchant. On Aug. 31, 1894, he and his brother Harold acquired the London *Evening News,* in which the Conservative party had sunk some £300,000. It was then losing money heavily, but it was at once reorganized with such effect that the first working week yielded a profit of £7, and the first year one of £14,000. In the same year he fitted out an Arctic expedition under F. G. Jackson, which explored Franz Josef Land. In the general election of 1895 he stood unsuccessfully as a Conservative candidate for Parliament at Portsmouth.

The Daily Mail.—On May 4, 1896, a new halfpenny morning paper, *The Daily Mail,* was launched, "the busy man's newspaper," as he called it. It embodied many innovations, a very full service of cables, the employment of numerous famous writers, condensation of unimportant topics, and costly and daring enterprises of various kinds. A comparison of past files of the London Press shows how it revolutionized daily journalism. One of the three leading articles in the first number dealt with the then almost unknown motorcar, in the future of which Alfred Harmsworth had a firm belief, being himself already a qualified driver. *The Daily Mail* attained a sale of 600,000 copies a day in the Boer War, and acquired sound influence on national policy at home and abroad.

In 1903 he founded *The Daily Mirror;* it was at first a complete failure, losing £1,500 a week but after being transformed from a penny paper for women into a halfpenny illustrated morning journal, became as signal a success. In 1905 a Continental edition of *The Daily Mail* was established, with headquarters in France. In 1904 Alfred Harmsworth was created a baronet, and in 1905 he was raised to the peerage as Baron Northcliffe. In 1906 he and his brothers acquired for their companies about 3,000 sq.m. of forest land in Newfoundland, with lakes, rivers and water transport, for the manufacture of paper and wood pulp, the result being the formation of the Anglo-Newfoundland Development Co., a gigantic enterprise with its works at Grand Falls, and two lines of railway, a port and Atlantic and other steamers.

In 1908 Lord Northcliffe obtained control of *The Times,* to own which had always been one of the aims of his life. New machinery was installed, and the size of the paper greatly increased; in March, 1914, he reduced the price to one penny, with the result of a large increase in circulation, though the enormous rise of 600% in the cost of paper during the World War forced a subsequent increase in price. Meanwhile Lord Northcliffe had acquired *The Weekly Dispatch;* disposed of the Sunday *Observer,* which he for some time owned; and sold *The Daily Mirror* to his brother, Lord Rothermere. Among the reforms which Lord Northcliffe introduced into newspaper management were the five-day week for editors, sub-editors and reporters, a more generous payment of journalists and a system of profit-sharing by the chief members of his staffs.

From 1900 onwards, through his newspapers, he had exercised an ever-increasing influence on politics. He had at one time been anxious, like Edward VII. and Cecil Rhodes, to obtain a friendly understanding between England and Germany, but the Boer War caused him to abandon that idea as impracticable. His newspapers consistently pleaded the cause of a strong navy, and as consistently warned the nation for 20 years of the peril from Germany. From 1902 he sought to effect an entente with France, and also to promote agreements with Russia and the United States, whose sentiments and prejudices he had learnt in many visits. Through *The Daily Mail* he gave large prizes for airmanship, in which, from 1906 onwards, he took the warmest interest. His maiden speech in the House of Lords was devoted to the pressing claims of aircraft. He was a strong believer in the future of flying and a daily advocate of the value of aircraft in war. He was also interested from the first in submarines, in one of which craft he made an early and hazardous descent.

The World War.—In the World War he aimed at the vigorous conduct of the struggle, and was from the first of opinion that the War would be long and desperately contested. The chief newspaper campaigns which he carried out, always with the aims of victory and close union between the Allies, were: (1) for the organization of the munition supply and provision of high-explosive shells in April and May 1915, when he did not hesitate to lay the responsibility for the shortage of ammunition on Lord Kitchener in leading articles written by himself in *The Daily Mail* of May 19 and 21, the second of which was publicly burned on the London and other stock exchanges; (2) this campaign was one of the causes of the formation of the Coalition Ministry by Mr. Asquith; (3) throughout 1915 and early 1916, in the teeth of storms of abuse, he urged the necessity of introducing compulsory service; (4) he protested continuously against the excessive optimism of the Asquith Government and against official secretiveness; (5) he called for the strict enforcement of the blockade; (6) so far as the censorship would allow, he resisted the Dardanelles and Salonika campaigns, which absorbed so large a part of the national forces; (7) he continued his pre-War demand for the construction of aircraft—and "the right kind of aircraft"—on the largest possible scale; (8) he urged the necessity of creating a strong naval war staff and taking offensive measures against the enemy submarines; (9) he insisted on the need of compulsory food rationing. While always active with his pen and through

his Press, he went repeatedly to the various battle-fronts, British, French, Belgian, Italian and American, and kept in close touch with the various staffs. In Dec. 1916 he gave his support to Mr. Lloyd George in the political crisis which led to the fall of Mr. Asquith's Government, and dealt the final thrust which brought that Government down, though after the Armistice, by reason of his objection to the long-drawn-out after-war negotiations with the Germans, he became Mr. Lloyd George's most persistent critic. He was offered office but declined.

Work in New York.—Before the United States entered the War he was offered and declined the post of British ambassador at Washington. But he went to New York (June 2, 1917) as chairman of the much-needed British War Mission returning to London on Nov. 12, 1917, when he was created a viscount, as Viscount Northcliffe of St. Peter-in-Thanet, for his services. On Feb. 13, 1918, he became director of propaganda in enemy countries. To pave the way for operations among the nationalities subject to the Habsburgs, he secured an agreement between the Yugoslavs and the Italian Government, which played a big part in the defeat of the Austrian Army and was subsequently embodied, in substance, in the peace terms. An account of his work was given in Sir Campbell Stuart's *Secrets of Crewe House* (1920); Crewe House being the London headquarters of the organization.

Last Days.—During the Peace Conference Lord Northcliffe's Press and the *Continental Daily Mail* especially exerted a powerful influence on the British Government, extracting from Lloyd George a promise to fulfil election pledges and striving to maintain the closest and most cordial relations with France. In July 1921 he went for a prolonged tour of the world, as he was medically advised to take a rest cure. A complete breakdown followed, and after a long illness he died on Aug. 14, 1922, of ulcerative endocarditis. (H. W. W.)

See his *My Journey Round the World* (1923); L. Owen, *The Real Lord Northcliffe* (1922); M. Pemberton, *Lord Northcliffe* (1922).

NORTHCOTE, JAMES (1746–1831), English painter, was born at Plymouth on Oct. 22, 1746. He was apprenticed to his father, a poor watchmaker, but in 1769 left his father and set up as a portrait-painter. In 1773 he went to London and was admitted as a pupil into the studio and house of Reynolds. At the same time he attended the Academy schools. In 1775 he left Reynolds, and, about two years later went to study in Italy. On his return to England he settled in London, where Opie and Fuseli were his rivals. He was elected associate of the Academy in 1786, and full academician in the following spring. Northcote's works are said to number two thousand, and he made a fortune of £40,000. Apart from his painting he wrote lives of Reynolds (1813), and of Titian (1830), and two series of *Fables*. He died on July 13, 1831.

NORTHCOTE, STAFFORD HENRY, 1ST BARON (1846–1911), was educated at Eton and at Merton college, Oxford. He became a clerk in the foreign office in 1868, acted as private secretary to Lord Salisbury, and was attached to the embassy at Constantinople from 1876 to 1877. From 1877 to 1880 he was secretary to the chancellor of the exchequer, was financial secretary to the war office from 1885 to 1886, surveyor-general of ordnance, 1886 to 1887, and charity commissioner, 1891 to 1892. In 1887 he was created a baronet. In 1880 he was elected M.P. for Exeter as a Conservative, and retained the seat until 1899, when he was appointed governor of Bombay (1899–1903), being created a peer in 1900. Northcote was appointed governor-general of the Commonwealth of Australia in 1903, and held this post till 1908. He died on Sept. 29, 1911.

NORTH DAKOTA, the "Flickertail state," is one of the north-central group of the United States, and lies between approximately 45° 55′ and 49° N. and 96° 35′ and 104° 3′ W. It is bounded north by the provinces of Saskatchewan and Manitoba in Canada, east by Minnesota, from which it is separated by the Red river, south by South Dakota and west by Montana. Its extreme length east and west is 360 mi., its extreme width north and south is 210 mi. Its total area is 70,665 sq.mi. of which 608 sq.mi. are water surface. The original territory of Dakota was so called because of its being the home of the Dakota Indians, the word "Dakota" meaning "allied" in the language of these tribes.

Physical Features.—In crossing North Dakota from east to west three distinct plains are encountered, rising one above the other. The most easterly of these, from 790 to 965 ft. in elevation, is the remarkably level valley floor of the Red river extending from the west river bank 30 to 40 mi. westward. This valley was once the bed of a great glacial lake (Agassiz) formed when the huge ice sheet retreated northward. Its floor is covered with rich, silty lake deposits, coloured black by decayed vegetation, making it one of the most fertile and best agricultural areas in the United States.

West of this valley, between it and the Missouri plateau, is an intermediate plain, ranging from 1,300 to 1,650 ft. in elevation and known as the drift plain. Its east and west width varies from about 70 mi. at the south to more than 200 mi. along the Canadian boundary. The surface varies from gently undulating to rolling and hilly and is marked by irregular ridges or glacial moraines. Small salt or alkali lakes, many without outlets, are abundant. The largest of these is Devils lake, an irregular body of water 40 mi. long, forming a natural reservoir for a large area in the northeastern part of the drift plain. Rivers of importance, the Mouse, Sheyenne and James, all show narrow valleys and undisturbed glacial drift indicating a youthful land. In general, the soil is excellent for grain crops and supports a large farming population.

Bordering the drift plain on the west, approximately paralleling the Missouri river and 50 to 60 mi. east of the stream, is an escarpment or abrupt ridge 300 to 400 ft. high. This escarpment forms the eastern edge of the third plain, the Missouri plateau.

While the ice sheet extended from 40 to 60 mi. west of the Missouri river, it did not leave enough drift to affect the surface features appreciably; consequently, the Missouri plateau presents a marked contrast to the other two plains. Ranging in elevation from 1,800 ft. east of the Missouri river to 3,178 ft. in the southwest, the area presents an irregular surface formed largely by water erosion.

The plateau is well supplied with streams west of the Missouri river including the Little Missouri, Heart, Cannonball and the Knife, all of which have almost countless small tributaries, many of which are dry except in spring. The innumerable small streams, branching out in every direction and extending into all parts of the region, form a land surface of continuous slopes leading to some drainage course. A conspicuous feature is the large number of buttes rising 400 to 700 ft. above the general level which form prominent landmarks. There large herds of beef cattle and other livestock graze on grassy ranges both in summer and winter. The extreme western part of the plateau, from the southern border north to the Missouri river, is known as the "badlands." Horizontal strata of soft shales and sandstones coloured gray, yellow, black and every shade of red and brown have been sculptured into an infinite variety of weird fantastic formations by action of streams and rains. Viewed from commanding points, the "badlands" present an indescribable waste, of beautiful colour, with countless ridges, bluffs, points, domes and buttes. There too, are found protruding black seams of lignite coal, burning lignite coal mines, petrified forests and other fossils. In 1946 the U.S. congress established the Theodore Roosevelt National Memorial park in the "badlands." Although the steeper slopes are almost bare, many of the more gentle ones and the small valleys are covered with grass and support large herds of livestock.

Trees are natively found only in the Turtle mountains, a group of hills near the Canadian border, in the region around Devils lake and several smaller lakes, along streams and rivers and in a few other places sheltered from the wind and sun. Cottonwood trees predominate. Stunted cedars and junipers grow in the sheltered ravines of the "badlands." Hundreds of shelter belts and farm groves have been planted east of the Missouri river, and many farmers and ranchers have small groves of trees west of the river.

Climate.—Since there are no mountains, forests or large bodies of water to have a moderating effect, the climate is strikingly uniform over the state with the exception of the southwestern re-

gion during the winter. There temperatures average 16° warmer than in the northeast, partly because of chinook winds coming over the Rocky mountains from the Pacific ocean.

Great extremes in temperature are likely to occur in any part of the state. During the summer, temperatures near 100° are not uncommon, but the nights are cool, seldom being more than 70° and often going as low as 40°. In the winter, temperatures often reach −20° and occasionally go much lower. These temperature extremes are not as noticeable as in more humid regions because of the low relative humidity or dry air. The seasons are sharply demarked; both winter and summer come rapidly. The summers are short, but long hours of sunlight make vegetation grow rapidly. Killing frosts sometimes occur in May and return again in September. High winds are frequent, tornadoes are not uncommon, and hail storms are frequent in summer. Winds are usually light during the growing season; but late in summer occasional dry, hot winds from the south prove destructive to crops. The average annual rainfall is 18 in., decreasing from 22 in. in the east to 15 in. along the western boundary. Although this is low, 77% of the precipitation comes during the crop season. Snowfall is heavier in the east (35 to 40 in.) than in the southwest where it averages 20 to 30 in., which is less than in other states in the country having temperatures averaging below freezing from November to March. Blizzards come rapidly and often cause severe loss of livestock and occasionally human deaths.

History.—The first white men to visit North Dakota were members of an expedition from Ft. La Reine (Portage la Prairie, Can.) led by Pierre Gautier de Varennes, usually known as Verendrye. They reached a Mandan earth lodge village in 1738 (possibly the Menoken site, 13 mi. E. of modern Bismarck). From there Verendrye's sons were sent by him to another village on the Missouri river. The visit of this famous French fur trader to the Missouri river is marked by the Verendrye National monument established in 1917 by the federal government near the present city of Sanish. However, since investigations in 1936, the Menoken site is believed to have been the place visited by the Verendrye party.

Two sons of Verendrye crossed the Missouri near Sanish, 1742–43, and explored the country to the southwest in an attempt to carry out their father's dream of establishing an overland trade route to the Pacific. After reaching the rugged slopes of the Big Horn mountains they abandoned their search and recrossed the Missouri river at Old Crossing, as it was known thereafter.

After the English occupation of Canada in 1763, two famous fur companies, the Hudson's Bay company and the North West company, operating from Ft. Garry (Winnipeg, Can.), established trading posts on the Missouri river at the mouth of the Knife river where they were found by the Lewis and Clark expedition that wintered at Fort Mandan, 1804–05, before proceeding to the Pacific the following year. The purchase of Louisiana territory by the United States in 1803, and the success of the Lewis and Clark expedition, made St. Louis a rendezvous for American fur traders who exploited the fur resources of the upper Missouri. The American Fur company was the best known of these firms. It was the first to use steamboats on this river (1831). It built among others Ft. Clark (1826) and the best known of all, Ft. Union in 1831.

Two European travellers visited America at this time, George Catlin (1832) and Maximilian (1833), and their published narratives, with the accounts of many others, give a picture of this early fur trade and of Indian tribes living along the Missouri river.

The North West company early penetrated southward from Ft. Garry to occupy the Red river valley. Charles Chaboillez established the first post at Pembina, 1797, and Alexander Henry, Jr., built his first post near the mouth of Park river in 1800 and later located permanently at Pembina in 1801.

David Thompson, famous fur trader and surveyor, was connected first with the Hudson's Bay company and later, 1796, was employed by the North West company. His journal is a mine of information concerning the location of trading posts in the northwest. He visited the Five Villages of the Hidatsa and Mandan Indians at the mouth of the Knife in 1797, the Pembina post of Chaboillez in 1798 and the post built by Cadotte at the junction of the Red and Red Lake rivers at the well-known Minnesota Point, opposite Grand Forks.

The War of 1812 put an end to all British attempts to extend their Canadian frontiers southward by means of a number of well-placed fur trade salients and by the assistance of the North West company and their Indian allies. In conformity with their new policy of American alliances, England turned over to the U S. the entire Red river valley which had been in the possession of the Hudson's Bay company since 1670. By the treaty of Paris in 1818, the international boundary was fixed at the 49th parallel as far west as the Rocky mountains.

The first genuine settlement of homeseekers in North Dakota in this period was made by a band of settlers from Lord Selkirk's colony of Scottish Highlanders in Manitoba who migrated south of the boundary line and settled at Pembina in 1819. When Maj. Stephen H. Long, leading the first United States exploring expedition into the Red river valley in 1823, visited the place, the population numbered 350. Ft. Snelling (St. Paul) was established in 1823, and a brisk trade between this fort and Ft. Garry soon developed along both sides of the Red river. It was carried on principally by means of the well-known Red river carts and continued to be important until after the early '50s when the flatboats and later the steamboats replaced this primitive form of transportation. Ft. Abercrombie was built in 1858 and Ft. Pembina in 1863, and these forts became the rendezvous for commercial and military operations in the northwest, as well as a rallying point for settlers.

Between 1850 and 1870 there was considerable difficulty with the Dakota Indians, whose lands in Minnesota had been largely appropriated by the whites, and whose buffalo herds on the Dakota prairies were fast being depleted by the hunting activities of traders and half-breeds. The Minnesota outbreak of 1862 was followed by campaigns by Gen. Henry Sibley and Gen. Alfred Sully in 1863 and 1864 which finally drove the hostile Dakotas to the "badlands" west of the Missouri river. All eastern North Dakota was now open for occupation, and the completion of the first railroad to the eastern border in 1871 inaugurated the settlement period in earnest.

The following decade was a period of intensive development in the Red river valley, and by 1880 settlement was spreading out over the area of the drift plain, especially along the line of the Northern Pacific railway which in 1873 had reached the Missouri river at Bismarck.

West of the Missouri the country was made attractive to settlers by the survey and extension of the Northern Pacific railway from Bismarck westward. The completion of the Great Northern railway across the northern part of the state in 1887 opened that region to eager settlers.

The region forming North and South Dakota, which since 1861 had been known merely as Dakota Territory, was divided in 1889 into a northern and southern half. A convention met in North Dakota in July and framed a constitution which was accepted by the people in an election held on Oct. 1. Pres. Benjamin Harrison declared the state's admission to the union on Nov. 2, 1889.

The years 1890–1915 were years of constant growth in population and intensive railroad development. Competing railway lines strove to forestall each other in tapping promising grain territory. Once there they did their best to bring settlers into the newly opened region by conducting land excursions. Nearly 18,000 immigrants annually for this span of years made new homes in the state. Settlement of the drift plain was practically completed and homesteaders invaded the good land beyond the Missouri river. The inrush continued with little abatement until World War I, after which, because of the general depression in agriculture, it practically ceased.

In politics, North Dakota is normally Republican, but its farmers and other dissatisfied groups have shown a tendency to desert the party in times of agricultural distress to form separate party fractions that usually promised more direct and radical remedies. In 1915, a number of Republican party members, who were dissatisfied with the method of marketing grain, organized

the Nonpartisan league with A. C. Townley, a Socialist, as the head of the organization. By 1918, the league had elected a governor and a majority in both houses of the legislature. During the 1919 legislative session, the league passed laws creating the State Industrial commission to manage industrial enterprises of the state; the Bank of North Dakota; the North Dakota Mill and Elevator association; the Home Builders' association (later discontinued); and a number of less important laws relating to workmen's compensation, hail, fire and tornado insurance, and printing.

In 1920 the Nonpartisan league lost much of its prestige, and many influential people from all parties were opposed to its program. Forgetting party lines, this group formed the Independent Voters association known as the I.V.A., and became influential in government during the remainder of the decade. In 1932 the league again came into strong control with the election of William Langer as governor, and it remained a strong force in governmental affairs.

To combat the success of the league the Democratic party and conservative Republicans formed a coalition in 1938 and elected John Moses, a Democrat, governor; he served until the end of 1944. Conservative Republicans, attempting to develop a strong party in 1943, adopted the name of Republican Organizing committee (R.O.C.), and elected Fred. G. Aandahl governor for three terms and Norman Brunsdale in 1950. The R.O.C. maintained strong control in governmental branches after 1944

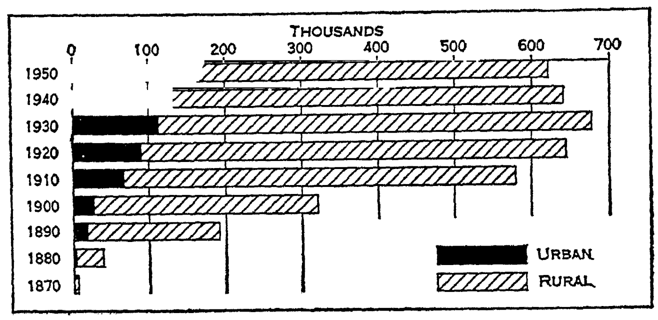
Government.—The state is governed under its constitution of 1889 as subsequently amended. Beginning in 1919, provisions were adopted for both the constitutional and the legislative ordinary initiative. The former permitted proposal of amendments by 20,000 qualified voters, and the latter the proposal of statutory law by 10,000 qualified voters. In all instances the direct ratification by the electorate is conclusive and applies to legislative proposals of amendment as well. The legislative or ordinary referendum, requiring 7,000 qualified petitioners, places a veto power over legislation in the hands of the electorate. The veto power of the governor does not extend to measures initiated or referred to the electors and thereupon passed, but does include the item veto on appropriation bills of the legislature. Amendment 33 gave the electors the power of recalling elective congressional, state, county, judicial or legislative officials, the recall petition to contain signatures of at least 33% of the voters voting for governor in the district of recall at the preceding election The legislative assembly is composed of a senate and a house of representatives with a membership respectively of 49 and 113 in 1949. Representatives are elected for two years and senators for staggered terms of four years. The assembly meets the first Tuesday after the first Monday in January in odd-numbered years.

Executive officers who are elected for two years are the governor, lieutenant governor, secretary of state, auditor, treasurer, attorney general, commissioner of insurance, commissioner of agriculture and labour, superintendent of public instruction, tax commissioner and three public service commissioners. The executive department includes about 50 boards and commissions whose members are partly elected officials serving with ex-officio duties, and partly officials appointed by the governor. Other appointments by the governor include adjutant general, state engineer, state mine inspector, state examiner, a three-member board of administration, a seven-member board of higher education, and members of many other professional examining boards. The industrial commission, composed of the governor, commissioner of agriculture and labour and the attorney general, is responsible for the management of all state-owned and -operated industries and enterprises.

The supreme court of the state is composed of five justices elected for ten years each. Terms are held on the first Tuesday of every month except July and August. There are six judicial districts in the state with justices elected for six-year terms. All counties have probate courts, and six counties provide county courts of increased jurisdiction superceding the district courts. Townships and villages have justices of the peace. Some cities are provided with police courts.

North Dakota has 53 counties, determined in number and size by the legislative assembly. The state relies in large measure upon the county for the local administration of most of the affairs in which it has a primary interest. The county thus constitutes the largest and most important unit in the administration of such basic activities as law enforcement, public health and welfare, highways, tax collection, recording, and election administration. Townships and school districts, however, share with the county in the administration of important functions. City forms of government in the state include mayor council, city commission and city manager.

Population.—The area which now forms North Dakota had 2,405 inhabitants in 1870 and 190,983 in 1890. The population of the state in 1910 was 577,056; in 1940, 641,935; and in 1950, 619,636, or 3.5% less than in 1940. The population per square mile in 1950 was 8.8, as compared with 9.2 in 1940, and with 50.7 for the U.S. in 1950.



BY COURTESY OF THE U S. BUREAU OF THE CENSUS

URBAN AND RURAL POPULATION OF NORTH DAKOTA: 1870 TO 1950

Of the 1950 population, 164,817, or 26.6%, lived in incorporated places of 2,500 or more, as compared with 20.6% in 1940. Since North Dakota had neither cities of 50,000 or more nor unincorporated places of 2,500 or more, these incorporated places constituted the urban area in 1950, the same as in 1940.

The number of households in 1950 was 162,184, as compared with 155,100 in 1940. The average population per household, based on the total number of inhabitants, had declined from 4.1 in 1940 to 3.8 in 1950.

TABLE I.—*Population of North Dakota and Its Principal Cities*

Area	Population			Per cent of increase	
	1950	1940	1930	1940–50	1930–40
The state	619,636	641,935	680,845	−3.5	−5.7
Urban	164,817	131,923	113,306	24.9	16.4
Rural	454,819	510,012	567,539	−10 8	−10.1
Per cent urban	26.6	20 6	16.6	..	..
Principal cities					
Fargo	38,256	32,580	28,619	17.4	13.8
Grand Forks	26,836	20,228	17,112	32.7	18.2
Minot	22,032	16,577	16,099	32.9	3.0
Bismarck	18,640	15,496	11,090	20.3	39.7

The population of the state was distributed by colour and nativity in 1950 as follows: 90.2% native white; 7.9% foreign-born white; and 1.7% nonwhite, practically all Indians. Of the 49,232 foreign-born white, 13,268 were born in Norway, 12,393 in Russia, 6,179 in Canada, and 4,195 in Germany. There were 107.8 males per 100 females in the native white population, and 122.3 in the foreign born; 7.9% of the population was 65 years old or over; and 53.1% of the population 14 years old and over was in the labour force. Of the total number of employed males, 52.1% was engaged in agriculture, 6.2% in construction, 3.0% in manufacturing, and 21.3% in transportation and trade.

Finance.—At the end of the 1950 fiscal year, total revenues were $65,045,182 ($105.26 per capita, as compared with $19.48 in 1932 and $28.13 in 1937). Payments were $88,378,862, leaving a balance of $57,446,693 on June 30, 1950. Although expenditures exceeded collections during the year, a balance of more than $80,000,000, carried over from 1949, offset the excess expenditure and left a large reserve.

The assessed valuation of property in 1950 was $1,119,294,450, with real estate valued at $724,905,532, personal property at $225,306,026 and public utilities at $169,082,892. Taxes are based on 50% of this total assessed valuation.

On June 30, 1950, there were 109 state banks with deposits of $301,657,657 and resources of $322,799,174; 41 national banks having $241,523,000 in deposits and $256,264,700 in resources; 10 state savings and loan associations with resources exceeding $27,000,000; 56 state credit unions having resources of more than $4,000,000; and a number of federal credit unions and savings and loan associations.

The inheritance tax was enacted into law in 1913, a motor vehicle licence tax in 1917, income, gasoline, and gross earnings taxes in 1919, a cigarette tax in 1925, a retail sales tax in 1935.

In addition to taxes raised by the state, the counties, cities, towns, villages, school districts, park districts and townships levy annual taxes which amounted to $31,523,000 in 1947.

Education.—Elementary and secondary schools are under the control of the state department of public instruction, with an elected superintendent, while the state institutions of higher learning are under the board of higher education appointed by the governor.

In 1948–49 there were 112,917 students enrolled in 2,263 school districts, 26,416 of whom were in secondary schools. The average daily attendance was 102,917 or 95.2%. School terms averaged 8.51 mo. with graded town schools averaging 9 mo. Transportation of 18,182 pupils indicated a growth in larger school districts. There were 6,349 teaching positions and the average salary for all teachers was $2,018. Total expenditures in 1948–49 amounted to $21,433,787—an average cost per pupil of $180. Schools are largely supported by local taxes, $13,023,525 coming from that source during 1948–49. Seven-twelfths of the state sales tax was distributed to school districts on the basis of need through the state equalization fund.

Public and private institutions of higher learning are numerous in the state when considered in relation to the population. There are two private schools, Jamestown college at Jamestown, with a 1950 enrolment of 347 and a staff of 32; and Wesley college at Grand Forks, with an enrolment of 214 and a staff of 10. A junior college at Bismarck enrolled 225 and one at Devils Lake enrolled 35 students. Below is a summary of public institutions:

TABLE II.—*State Institutions of Higher Learning*

Institution	Location	Year founded	Staff, 1950	Students, 1950	Education offered
University of North Dakota	Grand Forks	1883	178	2,294	4 years and graduate work
Agricultural college	Fargo	1889	164	1,960	4 years
Teachers college	Minot	1913	70	770	4 years
Teachers college	Valley City	1889	49	396	4 years
Teachers college	Mayville	1889	35	250	4 years
Normal school	Dickinson	1916	30	258	4 years
Normal and Industrial college	Ellendale	1889	22	147	4 years
School of Science	Wahpeton	1903	53	556	Junior college and trade training
School of Forestry	Bottineau	1897	12	85	Junior college

Corrections and Charities.—The state board of administration has general control over the major correctional and charitable institutions having a total appropriation of $7,418,369 for maintenance, improvements and operation in the biennium ending June 30, 1951. On June 30, 1950, the population at the hospital for the insane at Jamestown was 2,121; state training school for delinquent boys and girls at Mandan, 245; school for the deaf at Devils Lake, 90; school for the blind at Bathgate, 40; state penitentiary near Bismarck, including a state farm, 261; and a tuberculosis sanatorium at San Haven, Dunseith, 284. A soldiers' home at Lisbon is under a special board. The public welfare board, seven members appointed jointly by the governor, attorney general and commissioner of agriculture and labour, directs and controls such major phases of welfare as old-age assistance, aid to the blind, services for crippled children and child welfare services.

Agriculture and Livestock.—Probably no other state in the union depends so largely upon agriculture as does North Dakota. Of its total area 91%, or 41,001,158 ac., was classified as farm land in 1945. The 1949 estimated farm population was 285,000, considerably less than half of the total population as compared with 51.1% living on farms in 1935. Only 69,520 farms were in operation in 1945 compared with the high of 84,605 in 1935, even though the number of acres of farm land increased by 2,000,000 during the intervening period. Mechanization was largely responsible for increasing the size of farms from an average of 343 ac. in 1900 to 590 ac. in 1945. In addition to this large farm area and population, the many small towns comprising the major portion of the nonfarm population are almost entirely dependent upon farm trade. Total farm cash income in 1947 was $701,728,000, 28.4% of which was from livestock and products, 70.6% from crops and 1% from government payments. In 1948, buildings and land were valued at $26 per acre or $15,340 per farm.

North Dakota is divided into three farming belts. The black-earth belt occupies nearly all of the eastern half of the state. In this zone the soils are dark, moisture conditions are favourable, production is high, and the farms are smaller than in the other belts, averaging from 350–400 ac. West of the black-earth belt, extending a short distance west of the Missouri river, is the farming, grain and grazing belt. This belt, in general, presents a rougher topography, soils are somewhat lighter, production is lower, and the farms average from 500–600 ac. in size. In the southwestern quarter of the state is the grazing-forage crop belt. This region is hilly, the soils are residual in origin, and rainfall is less than in other parts of the state. Farms average from 700 to 1,000 ac. in size. Livestock and forage crops are important, but wheat and other small grains were produced in abundance after 1940.

Wheat is the main crop of the state; the 146,383,000 bu. produced in 1947 was valued at $319,974,000—46% of the cash farm income. Between 1919 and 1949 the average yield per acre varied from 5 bu. in drought years to 20 bu. in more favourable years. Wheat grown in North Dakota has a high protein content and commands a premium on the market. In 1947, 64,351,000 bu. of oats were harvested, valued at $21,837,000 and yielding 29 bu. per acre. In the same year barley amounted to 51,324,000 bu., with a cash value of $60,850,000 and an average yield of 21 bu. per acre; corn 24,374,000 bu., $2,195,000, 20 bu. per acre; rye 4,522,000 bu., $8,272,000, 14 bu. per acre; flax 12,112,000 bu., $54,703,000, 8 bu. per acre; potatoes 20,480,000 bu., $20,249,000, 160 bu. per acre; sugar beets 162,691 tons, 9.2 tons per acre; and tame and wild hay 3,184,000 tons valued at $1,913,000. Other crops include buckwheat, truck crops, fruits, alfalfa seed, sweet clover seed, soybeans, sorghums, forest products and nursery and greenhouse products. Potato production in the Red river valley increased by more than 15,000,000 bu. per year during the years 1919–49.

The production of livestock plays an important role in the farming industry of the state. Almost all farmers supplement the grain crop with livestock and poultry, although a small number of crop farms do not attempt to raise either. The greatest production of cattle in the first half of the 20th century was in 1944–45, with 1,915,000; sheep 164,000 in 1942; hogs 250,000 in 1943; chickens 50,696,000 in 1943; and turkeys 1,747,000 in 1941. In 1945 there were 951,000 cattle, and the number remained within 100,000 of that number in the next five years. Cattle accounted for 12% of the farm cash income in 1947, amounting to $93,561,000. The number of milk cows dropped to 392,000 in 1948 from a high of 640,000 in 1933. Average production of milk per cow, however, increased from 3,560 lb. in that year to 4,550 lb. in 1948. Dairy products were valued at $44,471,000 in 1948. Sheep production declined from the 1942 high to 380,000 in 1949. The greatest income from sheep in the period 1930–50 was $8,263,000 in 1946, and from wool $3,531,000 in 1943. Hog production reached a peak in 1944, totalling 1,101,000 valued at $38,742,000. The number of horses steadily declined, reaching a new low of 167,000 in 1949. In 1950 there were between 4,000,000 and 5,000,000 chickens and almost 1,000,000 turkeys.

Water Resources.—Ever since the retirement of the great glaciers northward the Missouri river, its tributaries and other lesser rivers of the state have been cutting their way across North

Dakota, removing topsoil, flooding lands, and dropping to extremely low levels in times of drought. After 1925, ground-water levels continued to sink, giving rise to many serious problems and speeding intensive study to devise means of controlling and developing remaining water resources. In 1943, Col. Lewis A. Pick of the U.S. army corps of engineers proposed an over-all plan for such control and development known as the "Pick plan." Basically, it called for six dams on the main stem of the Missouri river and 99 on its tributaries. The U.S. bureau of reclamation, at the same time, proposed the "Sloan plan" for irrigating thousands of acres of land around the Missouri river and of diverting water from the river through a series of canals, lakes and rivers to the eastern part of the state for additional irrigation and a stabilized water supply. In 1944, the two plans were co-ordinated and congress passed the Flood Control act.

On the Missouri river, 75 mi. N. of Bismarck, was begun the largest man-made lake in the world and the largest rolled-fill earth embankment ever constructed by man to 1950. As one of the key projects of the Pick-Sloan plan for control and development of the Missouri river basin, the dam and reservoir were to provide for flood control, power, irrigation, navigation, stream sanitation and, incidentally, recreation. The dam, with a maximum height of 210 ft., extends across the river valley for 12,000 ft. with a base 2,600 ft. wide. It is made up of 70,000,000 cu.yd. of earth, mostly taken from the dam site. The first earth was moved on Oct. 4, 1947. Behind this huge barrier, extending for 217 mi. northwest, was to be the man-made lake, with a maximum width of 14 mi., covering 390,000 ac., impounding 23,000,000 ac.ft. of water and having an elevation of 1,859 to 1,875 ft. above sea level. Three power units with a capacity of 80,000 kw. each were to be installed during initial construction, with space provided for two more units of the same capacity. The average dependable capacity of power output of all five generators would be 297,500 kw., with an average annual energy output of 1,712,000,000 kw.hr. Irrigated land would total 1,000,000 to 2,000,000 ac. after full development.

This mammoth project, spread over 500,000 ac. of land, necessitated the rerouting of 24 mi. of railroad, 108 mi. of highway and the moving of two towns (Sanish and Van Hook), the Fort Berthold Indian reservation and numerous telephone, telegraph and power lines. In order to house the necessary personnel for construction work, the government town of Riverdale was started in 1946 and by 1951 had grown to a city of more than 3,000. The total estimated cost of the project was $202,000,000.

Mining.—North Dakota possesses extensive lignite coal and clay deposits. Completion of a $750,000 federal lignite research laboratory at the University of North Dakota in 1950 was a big step forward in the development of almost unlimited supplies of this low grade of coal.

Lignite deposits of varying thickness underlie about 32,000 sq.mi. of surface in the state. The U.S. geological survey estimates that of the total lignite deposits of 965,902,000,000 tons in the United States, 633,329,000,000 are in North Dakota and about 500,000,000,000 are capable of being mined. Beds vary in thickness from a fraction of an inch to 35 ft., while 6- to 8-ft. veins are common. In places they are so close to the surface that the overlying soil can be stripped and the coal mined in open cuts; in other places the room and pillar method is used. In 1949–50 there were 104 licensed mines producing 3,212,534 tons valued at $7,875,799. Comparable figures were 416,580 tons in 1910 and 1,753,888 tons in 1940. Some companies briquette lignite.

Clay is found in a large number of varieties, ranging from common brick through tile to high grade art pottery clay. Deposits are especially large in the western part of the state where they are found near lignite beds which enhances the value of both.

Stone and gravel deposits in considerable abundance are found mainly in the ridges of glacial moraines.

Transportation.—The state is crossed east and west by two transcontinental railways, the Great Northern serving the northern part of the state and the Northern Pacific serving the southern part. Another transcontinental line, the Chicago, Milwaukee, St. Paul and Pacific, cuts across the southwestern corner, while the Minneapolis, St. Paul & Sault Ste. Marie runs from the southeast corner diagonally northwestward to make a transcontinental connection with the Canadian Pacific at the Canadian border. The Chicago and North Western railway and Midland Continental maintain short lines in the state. Railroad mileage increased from 4,201 in 1910 to 5,311 in 1920, but fell to 5,271 in 1940 and to 5,259 in 1950.

In 1950 there were 6,839 mi. of state highway, 95 mi. of which were concrete, 2,073 mi. other hard surfacing, 4,357 mi. gravel and 192 mi. graded. Rural roads totalled 107,593 mi., with .7 mi. concrete, 32 mi. other hard surface, 20,627 gravel, 20,392 mi. graded and the remaining mileage unimproved earth. Motor vehicle registration increased from 185,158 in 1940 to 281,044 in 1950.

Manufacturing and Industry.—Manufacturing did not have an important role in the state's economy at mid-century. Development of tremendous new power and water reserves, however, and new possibilities for the use of lignite coal would give impetus to manufacturing. All manufacturing and industry at mid-20th century were closely related to agriculture. Most important manufactured products were butter, cheese, ice cream, dried buttermilk, flour, feed and other grain products. After 1940 the manufacture of potato flour, potato chips, shoestring potatoes, building materials, brick, lignite briquettes, farm machinery, foundry products and road signs became increasingly important. Meat and poultry processing also developed considerably.

The estimated number of employees on June 30, 1949, was 130,699, an increase of 26% over 1940; and the estimated annual wage per worker in manufacturing was $2,650 in establishments of eight or more.

NORTH DWINA AREA, a unit of the northeastern region of European Russia, bordered on the west and north by Archangel, on the east and north by the autonomous Komi (Zirian) area, on the southeast by Vyatka, on the south by Gorky, on the southwest by Kostroma and on the west by Vologda. It has an area of 40,971 sq.mi. and a population (1926) of 678,255, of whom 80% are Great Russians and 18% Zirians. Over 80% of the region is clad with coniferous forest, the cleared areas being mainly along the river banks.

The Dwina and its tributaries, the Sukhona, Yug, Vychegda and Luza, drain the area; the Sukhona is most used for navigation, since it connects via the Württemberg canal both with Leningrad and with the Volga river. There are no bridges except the railway bridge over the Luza river.

Cultivation is most dense in the south, and along the river banks, but, apart from the 80% forest, there is 12.8% of marsh land, so that less than 10% is available for the production of the winter rye, oats, barley, flax and potatoes grown there. There is some meadow and pasture land, and horses, cattle, dairy cattle and pigs are bred, the latter in large numbers. The income from hunting and fishing is small, though the salmon and sterlet of the Dwina river are noted for their quality. Linen is the most important industry and exceeds pre-1914 level, as does production of hemp and jute rope.

In addition to river communications, the railway from Vyatka

reaches Kotlas (*q.v.*), which has wharves and grain elevators, and from which the railway is to be continued to Soroka on the Gulf of Onega, thus providing a further outlet for Siberian grain. From Ustyug-Velikiy (*q.v.*), the administrative centre, at the junction of the Sukhona and Yug, post roads, impassable in spring and autumn, go to Vologda and Gorky, and the town has telegraphic links with the south and also as far north as Krasnoborsk. Electrification proceeds rather slowly, though the few town centres have production plants. The peat reserves in the region should prove an asset in the future. The area needs much more intensive colonization for its full development. Recently the north India area ceased to exist as an independent unit and was divided between the Vologda and Archangelsk regions.

See M. I. Ivanovskiy, *The North Eastern Area* (1926) (in Russian).

NORTHERN AUSTRALIA, a term indefinite but applied generally to that portion of the continent which lies north of the Tropic of Capricorn (*c.* 1,150,000 sq.mi. = 0.386 or about $\frac{5}{13}$ of the whole territory), comprises the northern portions of Western Australia (364,000 sq.mi. = 0.373 of the state), of the (former) Northern Territory (426,320 sq. miles = 0.814) and of Queensland (359,000 sq.mi. = 0.535). Except for a practically continuous belt of coastal lowlands—broader along and up the river valleys of the northwest and north and around the Gulf of Carpentaria (*q.v.*), narrow to the point of disappearance along the northeast—almost the whole of this area consists of tablelands of 500–1,500 ft. general elevation with but few small and isolated higher areas in the west, northwest, northeast and central south. (*See* AUSTRALIA: *Geomorphology*.) Climate is thus the dominant factor and characteristic in this respect are prevailingly high temperature levels, 85°–75° F. (*c.* 68° in the central interior) and summer (monsoonal) rainfall: *c.* 60 in. along the north, sinking to 20 in. at about 18° lat. and to 10 in. and less farther inland. Thus, apart from the mineral wealth, of which little new has been discovered in recent years, the chief economic possibilities would appear to be pastoral development in the drier and more invigorating interior, scattered agriculture in the more humid lowlands and fishing—including pearl-oyster, etc., fishing (*see* BARRIER REEF)—around the coasts. The ultimate commercial and strategic importance of certain parts of the coasts are probably also considerable.

The regional differentiation inherent in so vast an area will increasingly invalidate generalizations about it and the tropical portions of Queensland and Western Australia are best dealt with under those States (*qq.v.*). The area which was till recently called the Northern Territory is on a somewhat different basis, and as it also offers a fair average cross section of northern Australia, a brief account of it is given here.

The area in question extends from the Western Australian to the Queensland border (Longs. 129°–138° E.) and from the north coast—including adjacent islands, *e.g.*, Melville, Bathurst, Groote Eylandt—to the South Australian border (26° S. lat.) and covers 523,620 square miles in all. After a chequered history it was handed over by South Australia to the commonwealth in 1911, and, as a result of further and on the whole unsuccessful experience, it was subdivided—in March, 1927, under the northern Australia act of 1926—into North Australia and Central Australia, lying respectively north and south of lat. 20° S., to the administered, from Newcastle Waters and Alice Springs (*q.v.*) respectively, as commonwealth territories, each by a government resident assisted by an advisory council of four. In 1931 the two sections were again united under an administrator at Darwin.

North Australia (287,056 sq.mi.) consists mainly of rolling country which rises from the coastal lowlands and valleys to a general level of 500–1,000 ft. inland. In the north is the rather higher (sandstone) tableland of Arnhem Land and on the east and west the land rises gradually to the Barkly tableland and the Kimberley plateau respectively. In the south the swell of the land forms (17°–20° S. lat.) an almost imperceptible watershed between the coastward and inward flowing drainage. The coast is mostly low, sand beaches and mangrove mud swamps alternating with cliffy bluffs, but some fine natural harbours ("drowned" river mouths) exist (*e.g.*, Port Darwin). There are two seasons, the wet (Nov.–May) and the dry, and the average ann. rainfall ranges from *c.* 40 in. in the north (Darwin: 62 in.) to 14 in. in the south, Temperatures are high, but the range is greater, the heat is drier and more bearable, and the winters are cooler towards the south (Darwin, av. ann. temp., 85.7°–77.2° F.; Daly Waters [300 miles inland], 88.2°–68.6° F. [*cf.* Alice Springs *inf.*]). In the wet season the streams are mostly swollen, swift and liable to flood and wide areas in the valley bottoms are then under water while inland are lagoons and swamps (Lakes Woods, de Burgh, etc.). The Victoria, Daly, Roper and McArthur are considerable streams but are normally navigable only in the dry season for small craft (4 ft. 6 in. draught; cargo capacity 35 tons). The valleys are often timbered and open forests occur in parts, but the prevailing vegetation is of the savanna type—grass with scattered trees—merging inland into poorer scrub with soft spinifex in the sandy southwestern corner. From Camooweal (Queensland) to Newcastle Waters, in the upper Victoria river basin, and also southwestward toward Hall's Creek (Western Australia) are broad belts and patches ("many thousands of square miles") of open black soil (limestone and volcanic) plains bearing first class fodder grasses (Mitchell, Flinders, etc.) and edible scrubs and here are the principal cattle stations (*e.g.*, Alexandra, Anthony's Lagoon, etc., on the Barkly tableland; Wave Hill, etc., on the Victoria river). Surrounding these and occupying the bulk of the central belt are great expanses of more mixed country, fairly well grassed and watered and containing good patches. The sandy plateaux of the north and of the coastal margins have many well-grassed valleys and the swampy flats mentioned above. Lateritic and travertine incrustations, products of climatic and soil conditions, render considerable areas unproductive. Water is, generally speaking, available on the surface or in underground supplies and various minerals are found around Pine Creek. The chief economic potentialities have been indicated. Efforts towards development have not hitherto been conspicuously successful and a summary of the present (1927) economic and social position will suffice.

Population: Europeans, *c.* 3,306; non-Europeans (mainly Asiatics) 744; aboriginals, 15,000. *Land Tenure:* Of the total area *c.* 750 sq.mi. have been alienated, *c.* 8,000 sq mi. have been reserved for aboriginals and 1,025 for mission stations, while 160,850 sq.mi are leased for pastoral purposes, nearly one-half (or *c.* $\frac{1}{4}$ of the whole of North Australia) of which is held by six lessees. *Stock* (including Central Australia): cattle, 923,000; horses, 32,700; goats, 20,300; and sheep, donkeys, mules, camels, etc. (Cattle and horses do well; sheep do best on the Barkly tableland.

Products:—*Minerals:* output, gold £109,000, wolfram £78,277, mica £19,712, together with some tin and copper. *Fisheries:* pearl shell (179 tons) £14,350, besides small quantities of other products. *Nuts and Grains:* ground-nuts (peanuts), cotton and millet; coconuts are grown on a small scale. *Trade:* exports: cattle exported by land, 98,400 (Darwin exports £29,800, mainly cattle to Manila; this trade in cattle has since been discontinued). Imports £29,406. *Communications:* railways (3 ft. 6 in. gauge), from Darwin to Emungalan (199 miles), has been extended to Birdum, 316 miles from Darwin. Bush tracks: *c.* 3,500 miles. Telegraph and cables: Darwin overland line southwards (to Adelaide), also cables (3 lines) to Java, Singapore, etc. Wireless: Darwin and various cattle stations. Steamer: Darwin to eastern (Australian) states, monthly; to Western Australia, every two months. Inland mail services: 6-weekly (pack horse). After World War II was declared, a good motor road was made from Birdum to the railway at Alice Springs.

General Social and Economic Conditions.—Isolation, lack of communications, pioneering conditions, climatic influences have contributed to social and political unrest, lack of balance, and of continuity and stability. Wages have been high, labour scarce and exacting, much effort and expenditure has produced small results. The total cost of the Northern Territory to the commonwealth (1911–1926) was nearly £9,000,000, including deficits taken over from South Australia (*c.* £4,000,000). Climatic difficulties, though serious, do not appear insuperable, but more

attention must be devoted to hygiene (housing, ventilation, diet, etc.) and to economic adjustments and adaptations (*e.g.*, morning and evening hours of work).

Darwin (pop. 2,538 in 1947), at present the seat of the administration, is well built and well laid out with wide streets, has stone buildings and amenities (botanic gardens, etc.) and a natural harbour capable of improvement. The subtropical district around Darwin does not invite agricultural development. In the better grazing districts to the south the rainfall is not suited to most crops with which Australians are familiar, though some peanuts, millets and cotton may be possible in the distant future. It is significant that the first recommendations of the commission should be directed toward the improvement of communications—railways, particularly the linking of the Darwin-Daly Waters line with the Queensland system via Camooweal, motor roads, stock routes, ports, notably a port on the gulf coast at the Sir Edward Pellew Islands to serve the Barkly tableland and farther interior—besides increased telegraphic, wireless, aerial and coastal shipping services; toward improved water supply and hygienic and social facilities (*e.g.*, broadcasting), and toward the initiation of organized scientific research.

(*See* also CARPENTARIA, GULF OF.)

Central Australia (236,400 sq.mi.) is an oblong area lying between latitudes 20° S. and 26° S. and longitudes 129° E. and 138° E. The flat-lying sediments (sandstones, etc.) which were the floor of an ancient (Mesozoic) sea were subsequently elevated and denuded and now form a plateau, highest (*c.* 2,000 ft.) in the centre and sloping down gently eastwards and southeastwards to the Eyre-Diamantina basin in Queensland and South Australia. In the north an extension of the West Australian "platform" stretches eastwards. (*Cf.* Murchison and Davenport "ranges," *c.* 1,000 ft.) Across the centre lie the Macdonnell ranges (Mount Heughlin, 4,800 ft.), a series of parallel ridges and troughs composed partly of hard folded (Palaeozoic) rocks, the uptilted edges of the above-mentioned plateau. The main drainage lines originate amidst, and north of, the Macdonnell range and run southeast (Finke, Todd, etc.) towards Lake Eyre. These streams, during a former rainier epoch, incised their courses to keep pace with the uplift (*v. sup.*) and have sawn through the hard ridges remarkable transverse gorges valuable because of the facilities they offer for routeways and for the impounding of water. Today the beds contain streams only after rains, the lower courses being normally long tree-lined tracks of water-bearing sand and gravel. The climate is transitional between that of northern and southern Australia and shows continental extremes (Alice Springs [alt. 2,000 ft.]: av. ann. temps. 84°–52.5° F with cool and bracing winters; rainfall occurs throughout the year with summer maximum and variations from 28.5 in. to 5 in.). Mainly steppe country with sparse scrub (mulga, etc.), low scattered growths, and grass in good seasons, the earth lies bare and dust-swept in times of drought except where stream courses, soaks, and waterholes afford a little moisture. Clay and stone desert patches occur and in the little-known northwest and southwest, and again in the east, are areas of sandridge, spinifex, saline flats (Lake Amadeus), and some scrub. In the more humid northwest are areas of seasonal swamp. (*Cf.* North Australia.) After rains the country is transformed as by magic; flowery grasslands spread like seas to the horizon, streams and pools sparkle, life awakens and flourishes for a space. Apart from a little agriculture for home needs—some of it possibly by irrigation—the economic future seems to lie mostly in the direction of pastoralism and mining. Minerals—gold (*e.g.*, Arltunga), mica, nitrates—a recent discovery—exist, the mica crystals are large and rather valuable. Erratic rainfall, rabbits and dingoes are the bane of the pastoralist and little stability can be obtained until water resources—superficial and underground—have been tested and supplies assured. Some 76,000 sq.mi. have been let under pastoral leases or grazing licences but as in North Australia the conditions of land tenure seem to need revision. Given water—horses, sheep, cattle, and live stock generally thrive, as do also human beings, in the climate. (Live stock: *c.* 117,000 head—including 85,000 cattle, 15,000 horses.) But costs of all necessities—including fencing and mining machinery—have been prohibitive. Transport has been by camel, horse or mule train, but motor traction is possible and is increasing. The overland telegraph line traverses the heart of the area and along it—with its government wells—lies the chief route for stock and men. Apart, too, from a few mining, cattle, and mission stations and blacks' encampments, practically all the population (whites: *c.* 410; aboriginals: *c.* 4,000) lives in telegraph stations along this route. The railway line (3-ft. 6-in. gauge) from Oodnadatta (South Australia) was built by 1929, and this extension brings Alice Springs (*q.v.*) within 60 hours (*c.* 1,000 miles) of Adelaide. Another line may ultimately be built from Alice Springs to the proposed port at the Sir Edward Pellew Islands (Carpentaria, Gulf of, *q.v.*) thus giving the area a northern outlet as well. Except near Alice Springs most of Central Australia has not been found worth occupying. But with improved conditions of water supply, transport, fencing (against dingoes, etc.), its stock holding capacity, though it will never be high, will probably improve somewhat in the future. In particular new sheep areas await development here and facilities for movement (railways, stock routes, etc.) will help to combat drought. Much of the southwest portion has been made into an aboriginal reserve.

NORTHERN IRELAND: *see* IRELAND, NORTHERN.

NORTHERN PACIFIC RAILWAY. The main line of the Northern Pacific railway extends from Ashland, Wis., United States, through the states of Minnesota, North Dakota, Montana, Idaho, Washington and Oregon, to Seattle and Tacoma in Washington and to Portland, Oregon. Its main terminals in the east are St. Paul, Minneapolis, Duluth and Superior; in the west, Seattle, Portland and Tacoma. It was constructed under an act of congress approved by President Lincoln on July 2, 1864. With its completion in 1883 the vast territory adjacent to it was first made accessible to settlers, and the government's long-cherished aim of opening to the north Pacific coast a route following, roughly, that taken by the explorers Lewis and Clark in their expedition of 1804–06, was at length realized.

The Northern Pacific system consisted in 1939 of about 6,720 mi. of operated railroad. It owned also nearly one-half of the stock of the Chicago, Burlington and Quincy Railroad company, and exactly one-half of the stock and bonds of the Spokane, Portland and Seattle Railway company, operating together 11,000 mi. additional. A large part of the tonnage which it carries consists of the products of agriculture and of the forest; but its traffic is well diversified and its earnings, under normal conditions, are comparatively stable. It has outstanding 2,480,000 shares of stock of a par value of $100 each. Its bonded indebtedness in 1939 was $316,000,000. (C. E. DE.)

NORTHFIELD, a city of Rice county, Minnesota, U.S.A., on the Cannon river 35 mi. S. of St. Paul. It is on federal highway 65, and is served by the Chicago Great Western, the Chicago, Milwaukee, St. Paul and Pacific, the Minneapolis, Northfield and Southern, and the Rock Island railways, and by motorbus lines. Population (1950) 7,487 by the federal census. It is the seat of St. Olaf college (Norwegian Lutheran, 1874) and of Carleton college (1866). The former is the home of the St. Olaf Lutheran choir, and a centre of Norse culture. Carleton is known for the work of its science departments and strong liberal arts faculty. Northfield is surrounded by a rich farming and dairying region, where the breeding of Holstein cattle is an important specialty. It was settled by New Englanders in 1856; named after John W. North, who platted it, and chartered as a city in 1875.

NORTHFLEET, an urban district in the Gravesend parliamentary division of Kent, Eng., on the River Thames, 20 mi. E.S.E. of London bridge and 2 mi. W. of Gravesend by road. Pop. (1951) 18,803. Area 5.9 sq.mi. The town is an industrial centre with printing works and factories for cement, paper, electric cables, etc. The church of St. Botolph is of Norman foundation, the nave is Decorated and the chancel Perpendicular, and the tower was rebuilt in 1628. Swanscombe (pop., 1951, 8,295) adjoins Northfleet on the southwest. Its name is said to be derived from a camp formed there by the Danish king Sweyn, and tradition fixes at that spot the meeting between William the Conqueror and the men of

Kent, to whom was confirmed the possession of all their ancient privileges.

NORTH HOLLAND, a Netherlands province, lying between the North sea and the Zuider Zee (IJsselmeer) and bounded southward by the provinces of South Holland and Utrecht. The present area, including the islands of Texel, Vlieland and Terschelling, in the West Frisian group, and Marken and Urk in Zuider Zee, the isle of Wieringen having been incorporated with the mainland, as starting point of the Afsluitdijk (closing dike) which drains the Zuider Zee and connects the provinces of North Holland and Friesland, is 1,065 sq.mi., with pop. (1950) 1,847,272, showing an increase during the 20th century from 905 per square mile to 1,808 per square mile. Three natural divisions can be recognized: (1) foreshore and sand dunes, (2) inner dunes and the *geest* grounds, (3) low fens and clay lands. The dunes form a long, smooth, unbroken protection for the other regions, and the absence of deep inlets explains the absence of commercial towns. Ijmuiden is a small town, and its recent creation was solely dependent on its position at the exit of the artificial North sea canal from Amsterdam. Nevertheless, the broad, gently sloping, sandy beach is admirable for sea bathing and permits the beaching of the characteristic flat-bottomed fishing boats used at Zandvoort and at smaller fishing villages. Bergen aan Zee, Egmond aan Zee and Wijk aan Zee are gay little unconventional resorts. In the second zone, behind recently planted woods, especially along the margin of the *geest* grounds, from about 5 mi. N. of Haarlem to 10 mi. S., hyacinths, tulips, narcissi and crocuses, in exact squares of brilliant and varied colours, attract numerous tourists each springtime, while market gardens provide valuable and continuous products for home and foreign trade.

This part of North Holland was early inhabited and contains many old towns and villages. Some of the most interesting are Haarlem (pop. 161,980), the seat of government of the old counts of Holland and the scene of the great resistance of 1573—one of the most glorious failures in history. Near to Haarlem are the extensive red brick ruins of Brederode castle, the seat of an old and illustrious family. Nearer to the south border is Bennebroek, the site of a 10th-century nunnery. Alkmaar (*i.e.*, all water) (pop. 31,774), though originally belonging to the lowland zone, also has important historical associations, including its personal success against the Spaniards in the Eighty Years' War. Near Alkmaar are Schoorl, a village in the 9th century; Bergen, also of considerable antiquity; Heiloo, stated to be the site of a church built by St. Willibrord in the 8th century; and the villages of Beverwijk and Velsen. Other possessions of the same apostle still remain, while Egmond, near by, was famed for its great abbey. Nearer Helder (pop. 37,113) is Schagen, a flourishing village in the 12th century, a lordship in the 15th, but of no special importance today.

The third division comprises much the largest area, that lying at or below sea level. Considerable land reclamation has been effected. To the north of the former Y (or IJ) the famous Purmer and Beemster lakes were drained in the beginning of the 17th century; but several sea polders to the north of these were added to the mainland only in the first half of the 19th century. This region is traversed by the 46-mi. North Holland canal (1819–25), between Amsterdam and Helder. The Y, formerly an inlet of the Zuider Zee, was drained, and the direct east-to-west 15-mi. North sea ship canal was cut in its stead (1865–76); in the south, Haarlem lake (72 sq.mi.) was drained between 1840 and 1853. The landscape in this lowland division is more typically Dutch than elsewhere. The province is very poor in minerals. Consequently cattle rearing and cheese manufacture (chiefly Edam) are the main industries, but agriculture and even market gardening are also practised in the heavier clay lands of the polders. Purmerend, the natural focus of the Purmer, Wormer and Beemster polders, with street and canals too narrow to contain the present market-day produce; Alkmaar, the great cheese town with a famous weigh house; and Enkhuizen, one of the "dead cities" of the Zuider Zee, are the chief market centres. The security offered by the Zuider Zee for trade and fishing was the prime factor in the commercial development of North Holland, and the cities of Medemblik, Enkhuizen, Hoorn, Edam and Monnikendam, though now of little more than local importance, possessed a large foreign commerce in the 16th and 17th centuries. This prosperity later concentrated itself upon the Y (that is, upon Amsterdam; *q.v.*) and upon the series of industrial settlements situated on its offshoot, the Zaan, of which Zaandam (pop. 43,218, with oil, saw, corn, cement and paper mills) is the most important.

Of the islands, Marken is rapidly learning how to commercialize its own quaintness, though it is not yet entirely spoiled. Microscopic Urk has a population (about 3,000) largely dependent on the North sea fishery. Texel is noted for sheep and their products, wool and green cheese, and also for sea birds' eggs, which are exported to Amsterdam. Vlieland and Terschelling are but slightly populated and relatively unimportant.

NORTHINGTON, ROBERT HENLEY, 1ST EARL OF (*c.* 1708–1772), lord chancellor of England, was the second son of Anthony Henley, a Whig member of parliament and a well-known wit and writer. Robert was educated at Westminster school and St. John's college, Oxford, and was called to the bar in 1732. In 1747 he was elected member of parliament for Bath, of which he became recorder in 1751. He acquired a lucrative practice at the bar and in 1756 was appointed attorney general. In the following year he was promoted to the office of lord keeper of the great seal, being the last person so designated. For three years he presided over the house of lords as a commoner, having incurred the hostility of George II. He was given the title of Baron Henley in 1760 so that he could preside at the trial of Earl Ferrers for murder.

On the accession of George III the office of lord chancellor was conferred on Henley, and in 1764 he was created earl of Northington. In 1765 he presided at the trial of Lord Byron for killing William Chaworth in a duel. Northington, who was a member of the group known as "the king's friends," was instrumental in procuring the dismissal of the marquess of Rockingham and the recall of Pitt to office in 1766, and he himself joined the government as lord president of the council, Lord Camden becoming chancellor. He resigned office in 1767 and died at his residence in Hampshire on Jan. 14, 1772.

See Lord Henley, *Memoir of Robert Henley, Earl of Northington* (1831); Campbell's *Lives of the Chancellors;* Foss's *Judges of England;* Horace Walpole's *Memoirs.*

NORTH LITTLE ROCK, a city of Pulaski county, Ark., U.S., on the Arkansas river, opposite Little Rock; served by the Missouri Pacific, the Rock Island and the St. Louis Southwestern railways. Pop. (1950) 44,097 by federal census. It is an industrial and distribution centre, with extensive railroad shops and miscellaneous types of manufacturing industries.

NORTH PACIFIC COAST INDIANS. The Indians of the coast of southern Alaska, British Columbia, Washington, Oregon and northern California formed an areal grouping of tribes with a common cultural foundation. The principal tribes and stocks comprised are the Tlingit, Haida, Tsimshian, Kwakiutl, Nutka, Bella Coola and other Coast Salish, Chimakun, Makah, Chinook, Yakonan, Kus, Takelma, Yurok, Wiyot, Karok and the Hupa and other Athabascan groups. Linguistically there was considerable diversity among these groups; otherwise their similarities exceeded their differences. Generic cultural features extending over the entire area were: dependence primarily on fish, especially salmon; coastal maritime navigation; development of woodworking, including the carver's art; wealth accumulation, with an elaborate system of economic exchange and property law; the organization of society on the basis of hereditary rank dependent on economic status; religious cults heavily influenced by proprietary rights. Particular traits exemplifying these trends were: deep-sea fishing; whale hunting; large dugout canoes with plank lashings for higher freeboard; mat sails; clothing largely of mats, with basketry hats; twined basketry with overlay decoration; villages of large, all-frame houses facing the beach or river; totem poles and wooden grave monuments; boxes for cooking, storage, etc.; clubs, spoons and most utensils, also rattles, masks, etc., elaborately carved or painted in a peculiar totemic-symbolic art style; dentalium shells, plates of native copper, boxes, etc.,

serving as standardized mediums of exchange, often with high fictitious credit values; potlatches or competitive socioreligious festivals with wealth distribution for prestige; loans with high rate of interest; division of society into rich nobles with titles, crests and privileges, commoners and slaves; marriage by purchase; secret religious societies with elaborate ranks and masks. The greatest concentration and elaboration of this distinctive combination of traits occurred among the Haida, Tsimshian and Kwakiutl. In several respects, however, the classic manifestations of the complex among these tribes were late and short lived. Thus, woodworking and potlatching were greatly stimulated through access to iron tools and external sources of wealth subsequent to 1800, but both practices were on the decline well before the end of the 19th century.

Hunt, A. Krause, A. L. Kroeber, A. B. Lewis, T. F. McIlwraith, C. F. Newcombe, A. P. Niblack, E. Sapir, G. M. Sproat, J. G. Swan, J. R. Swanton, G. Vancouver and M. Barbeau. (A. L. K.; H. G. BT.)

NORTH PLATTE, a city of Nebraska, U.S., 280 mi. W. of Omaha. It is on the Lincoln highway, a main transcontinental airway and the main line of the Union Pacific railroad. The population by the federal census of 1950 was 15,433; (1940) 12,429. The city has one of the largest icing plants in the country. The irrigated region raises sugar beets and hay. There is a station of the U.S. weather bureau and a state agricultural experiment station 4 mi. S. "Scouts Rest," the ranch of Col. W. F. Cody ("Buffalo Bill") is 3 mi. N.W. North Platte was incorporated in 1871.

NORTHROP, JOHN HOWARD (1891–), U.S. biochemist, winner of the 1946 Nobel prize in chemistry with W. M. Stanley and J. B. Sumner, pioneer in crystallization of enzymes and related substances, was born July 5, 1891, at Yonkers, N.Y.

Columbia trained, he received his doctor's degree in 1915 and later studied with Jacques Loeb at the Rockefeller Institute for Medical Research on theories of life duration. He became a member of the institute in 1924. In 1949 he was named research professor of bacteriology at the University of California, Berkeley. Early work on fermentation to produce acetone and ethyl alcohol led to the study of enzymes essential for digestion, respiration and general life processes. He showed that enzymes obey chemical laws. In 1930 Northrop prepared pepsin in pure crystalline form. With M. Kunitz he succeeded in crystallizing the enzymes trypsin and chymotrypsin as well as their precursors trypsinogen and chymotrypsinogen. With Roger M. Herriott he isolated crystalline pepsinogen. He studied proteins of meat, viruses and antibodies. From the intestines of mammals, Northrop isolated a bacteriophage, a virus which destroys bacteria. He also made studies on starch, the kinetics of bacteriophage, agglutination of bacteria and temperature effect on insects. In 1941 he purified diphtheria antitoxin. In 1939 he published *Crystalline Enzymes* and assumed the editorship of the *Journal of Physiology* of the Rockefeller institute. He served in the chemical warfare service in World War I as captain, and in World War II he was consultant to the National Defense Research committee. (V. Bw.)

NORTH SEA, a sea occupying a shallow basin between Great Britain and continental Europe. It extends southward from the edge of the continental shelf north of the Shetland Islands to the Straits of Dover, covering an area of about 222,100 sq.mi. Its bed slopes gently down from south to north as a rule. The southern areas are very shallow, with many low ridges of sand barely covered at low tide. Off the Holderness coast the Silver Pits and other east-west trenches show depths of more than 50 fathoms in places. The Dogger bank, a submerged plateau, rises abruptly to the north of these depressions and occupies about one-third of the width of the sea. Depths over the bank vary from 8 to 20 fathoms and are less than 10 fathoms over 250 sq.mi. of its area. The nets of trawlers fishing on the Dogger have brought up masses of peat, sometimes containing teeth and bones of prehistoric land animals, showing it to have been a wooded area after the close of the Ice Age. To the north the bed slopes very gently, though cut by several depressions, until the continental edge is reached. In the northeast the Norway deep or Gut is a remarkable feature. It begins off Alesund as a break in the edge of the continental shelf and extends southeastward as a narrow trench, parallel to the Norwegian coast, into the Skagerrak as far as Oslo. Its depth increases toward its head, depths of more than 400 fathoms being recorded in Skagerrak. Its edge rises very steeply on the Norwegian side but much more gently on the west.

History.—The North sea basin was formed by slow submergence during Tertiary times. Toward the close of the Pliocene period its southern margin lay along the northern edge of the Dogger bank and the north Yorkshire moors, a long estuary penetrating far to the south between them. This was probably the outlet of an ancestral Rhine to which the early Thames and other rivers of eastern England flowed over a marshy plain. During the glacial period most of the basin was repeatedly covered by ice sheets, and thick deposits of drift were laid down over the former plain. At the close of that epoch the Dogger bank, Holderness and a wide coastal plain beyond the present shores were all exposed. On these surfaces woodlands and peat swamps developed whose remains form the forest beds exposed at low tide at many points along the present coasts. It was on this land surface that the river systems of today were developed. A later rise of sea level led to the covering of this surface and brought about the formation of the Wash and the Humber and many of the minor estuaries on the English and continental shores. The present coastal limits, in their broad outlines at least, were finally determined in the period extending from Middle Stone Age to Bronze Age times. The Straits of Dover were probably first opened during the Ice Age.

Coasts.—The North sea coasts of Norway and Scotland are usually cliffed except along the more penetrating inlets. That these have been cut so often in highly resistant rocks is an indication of the long period during which wave action has continued at or about their present position. South of Berwick and the Skagerrak the coasts are composed of softer rocks, and cliffs, where present, might be of relatively recent formation even when, as in northeastern England, they are of considerable height. On the English side of the North sea, south of Flamborough head, low cliffs, often of boulder clay and fronted by sandy beaches, are characteristic. The continental shores are usually low and flat and backed by wide marshes, sometimes protected by coastal sand dunes and sometimes by artificial dikes. A slow but persistent down-warping seems to be taking place over all the southern areas of the sea and causing a relatively rapid shift of the coast line except where it is protected. Such floods as those of Jan. and Feb. 1953 are almost certainly indicative of this transgression of the sea upon the land.

Temperature and Salinity.—Thanks to the great influx of land water from the Baltic and from the many rivers which enter the North sea directly, its waters are less saline (34.5 *pro mille* on the average) than those of the Atlantic. Baltic water entering it has a salinity of less than 30 *pro mille*. Coastal waters are fresher than those of the central areas where tidal turbulence produces thorough mixing. Because of snow melt and higher winter rain, salinity is lowest in winter and spring. In summer and autumn, warmer Atlantic water of more than 35 *pro mille* salinity enters the basin from the north and through the Straits of Dover. These movements affect the migrations and spawning dates of fish. Sea temperatures are always high enough to prevent freezing.

Tides.—Tides from the ocean enter the North sea in three main streams: (1) around the north of Scotland and advancing southward along the east coast of Britain; (2) from the English channel and moving along the Dutch and German shores; (3) along the Norwegian coasts toward the Skagerrak. A counterclockwise circulation, though with several minor eddies, is thus produced. The flood tide of the Scottish system reaches the Thames estuary at the same time as the next succeeding high tide coming up-channel, and the interference of the two waves produces local complications. Thus the range of tidal levels off the Thames is increased and the range between Yarmouth and the Helder decreased by their interaction. Tidal ranges on the British coasts are about double those on the Dutch and German and nearly four times those on the Norwegian coasts.

Fisheries.—The waters of the North sea are extremely rich

in many forms of marine life. Especially are they so in the microscopic forms of plant and animal life, known collectively as plankton, on which either directly or ultimately all fish depend for their food. The amazing abundance of this food supply is attributed to many factors—the mingling of Atlantic waters with local waters differing from them in temperature; the plentiful supplies of food substances derived from the land; the turbulence of the sea because of storms, and tidal and other currents, all contributing to its aeration; and the shallowness permitting the penetration of sunlight to the sea bed. In consequence, few other seas rival the North sea in the quantities of food fishes it supports. The chief varieties are herring, cod, haddock, plaice, sole and turbot. Herrings are found off the British coasts between June and November when they gather in great shoals in the surface waters. Mackerel appear in the same waters earlier in the year. Cod are caught mainly on the Dogger bank (*dogger* in Dutch signifies cod) and in the colder northern waters. The flat fish prefer the shallower seas except in winter when they move to such deeper waters as those of the Silver Pits. At other times they are found mainly in the southern and eastern regions from the Thames estuary to Denmark.

NORTH SHIELDS, seaport, Northumberland, England, within the borough of Tynemouth (*q.v.*, for history, etc.), which adjoins it on the east. It lies immediately above the mouth of the Tyne, opposite to South Shields, 7½ mi. E. of Newcastle by a branch of the North-Eastern Region railway. It is a town of modern growth. Coal and coke are largely exported, and corn, timber and esparto grass are imported. There is an extensive fish quay. There are marine engineering (engines, chain cables, anchors), salt, rope, earthenware and stained glass works and some shipbuilding is carried on.

The town was specially affected by the depression of the 1930s, more than 27% of the insured population being unemployed in June 1934.

NORTH TONAWANDA, a city and a port of entry of Niagara county, N.Y., U.S., on the Niagara river, at the western terminus of the State Barge canal (opposite Tonawanda), 14 mi. N. of Buffalo.

It is on the boulevards connecting Buffalo and Niagara Falls, and is served by the Erie, the Lehigh Valley, and the New York Central railways and by motor-bus lines. The population of North Tonawanda was 24,731 in 1950; in 1940 it was 20,254; and in 1930, 19,019 by the federal census.

Though separately incorporated, the two Tonawandas are practically one community. Electric power rates are among the lowest in the United States.

The cities have a great diversification of industry, and manufacture, among other things, musical instruments, office equipment, nuts and bolts, bakelite, chains and hoists, paper products, steam pipes, silk products, skis, wagons and sleds, furniture, chemicals and roofing supplies.

North Tonawanda was settled in 1809, incorporated as a village in 1865 and chartered as a city in 1897.

NORTHUMBERLAND, EARLS AND DUKES OF. The earldom, and later the dukedom, of Northumberland, are famous in English history by their connection with the house of Percy (*q.v.*).

In the year 1377 Henry de Percy, 4th Baron Percy, officiated as marshal of England at the coronation of Richard II and was created earl of Northumberland. With his son Sir Henry Percy, the celebrated "Hotspur," the earl played a leading part in the history of the period, especially in bringing about the deposition of Richard II and the accession of Henry IV. The quarrel of Northumberland and his son with King Henry over the ransom of their Scottish prisoners taken at Homildon Hill on Sept. 14, 1402 has been immortalized by Shakespeare; and in consequence of their rebellion all the earl's honours were forfeited in 1406. He was not himself present at the battle of Shrewsbury in July 1403, when Hotspur was killed, but he was slain, heading a fresh rebellion, at Bramham Moor on Feb. 19, 1408.

The 1st earl of Northumberland was succeeded by his grandson, Hotspur's son, HENRY (*c.* 1394–1455), who was restored to the earldom and the estates of the Percies in 1414 and was killed at the battle of St. Albans in May 1455. The title then descended in the male line till the death of the 6th earl in 1537. During the Wars of the Roses the Percies took the Lancastrian side, which led to the attainder of Henry the 3rd earl (1421–1461) during the time of the Yorkist triumph, his forfeited title being conferred in 1464 by Edward IV. on John Neville, Lord Montagu (*see* the separate article, p. 538), by a patent which was cancelled a few years later. The earldom, together with the barony of Poynings which his father had obtained by marriage, was restored in 1473 to Henry Percy, son of the 3rd earl, who attached himself to Edward IV., acquiesced in the accession of Richard III., and submitted to Henry VII., by whom he was received into favour. His grandson Henry, the 6th earl (*c.* 1502–1537), left no direct heir, and the latter's nephew, Thomas Percy, was debarred from the succession by an attainder passed on his father for his participation in the Pilgrimage of Grace. In 1549, however, Thomas was restored in blood, and in 1557 he became by a new creation earl of Northumberland, 7th of his line. Meantime, in 1551, John Dudley, earl of Warwick, was created duke of Northumberland (*see* NORTHUMBERLAND, JOHN DUDLEY), his title being, however, forfeited by attainder in 1553.

The earldom restored to the house of Percy by the creation of 1557 continued without interruption in the male line till 1670. The 7th earl was beheaded in 1572 for sharing in a conspiracy in which he was joined by the earl of Westmorland with the object of securing the release of Mary Queen of Scots and the free exercise of the Catholic religion. By the earl's attainder the baronies of Percy and of Poynings and the earldom of Northumberland of the older creation were forfeited, but owing to a clause in the patent the newer earldom of Northumberland and the other honours conferred in 1557 passed to his brother Henry (*c.* 1532–1585), who is usually known as the 8th and not the 2nd earl.

Henry's grandson, ALGERNON PERCY, 10th earl of Northumberland (1602–1668), son of Henry the 9th earl (1564–1632), became a peer in his father's lifetime as Baron Percy in 1626. Northumberland played a distinguished part in the Civil War. He was a friend of Strafford, and gave evidence at his trial which, though favourable on the important point of bringing the Irish army to England, was on the whole damaging; and he afterwards leaned more and more towards the popular party, of which he soon became leader in the House of Lords. He was a member of the committee of safety, and later of the committee of both kingdoms; and he took an active part in the attempts to come to terms with the king, whom he visited at Oxford for that purpose in 1643 and at Uxbridge two years later. Northumberland helped to organize the new model army; and in 1646 he was entrusted by parliament with the charge of the king's younger children. He led the opposition in the House of Lords to the proposal to bring Charles I. to trial, and during the Commonwealth he took no part in public affairs. At the Restoration he was called to the privy council by Charles II., and with his habitual moderation deprecated harsh proceedings against the regicides. His second wife, Elizabeth (d. 1705) daughter of Theophilus Howard, 2nd earl of Suffolk, brought him Northumberland House in the Strand, London, which was demolished in 1874 to make room for Northumberland avenue. On the death of his son Joceline, the 11th earl, in 1670, the male line became extinct.

George Fitzroy (1665–1716), third son of Barbara, duchess of Cleveland, the wife of Roger Palmer, earl of Castlemaine, by King Charles II., was created by his father earl of Northumberland in 1674, and duke in 1683. This second dukedom of Northumberland became extinct on his death at Epsom on July 3, 1716.

Meanwhile Elizabeth Percy, daughter of Joceline, the 11th earl, had married Charles Seymour, 6th duke of Somerset; and her son Algernon, the 7th duke, was in 1749 created Baron Warkworth and earl of Northumberland, with remainder to

his son-in-law, Sir Hugh Smithson, Bart., son of Langdale Smithson of Langdale, Yorkshire. Sir Hugh Smithson (*c.* 1714–1786) took the name and arms of Percy on inheriting the earldom in 1750; in 1766 he was created Earl Percy and duke of Northumberland; and in 1784 he was further created Baron Lovaine of Alnwick, with special remainder to his second son, Lord Algernon Percy. He took a prominent part in politics as a follower of Lord Bute, and was one of George III.'s confidential advisers, holding the office of lord-lieutenant of Ireland from 1763 to 1765, and that of master of the horse from 1778 to 1780. He was a man of cultivated tastes, and spent much money in repairing and improving Alnwick castle and his other residences. His wife, Elizabeth (1716–1776), inherited in her own right her father's barony of Percy. The duke was succeeded by his eldest son Hugh; and his second son Algernon, Lord Lovaine, was created earl of Beverley in 1790.

Hugh, 2nd duke of this line (1742–1817), first inherited his mother's barony of Percy. He was present at the battle of Minden, and although in parliament, where he was member for Westminster from 1763 to 1776, he had opposed the policy that led to the American war, he proceeded to Boston in 1774 as colonel commanding the 5th Fusiliers, a regiment that has since then been known as the Northumberland Fusiliers. He succeeded to the dukedom in 1786, and became general in 1793. His son Hugh, 3rd duke (1785–1847), was lord-lieutenant of Ireland in 1829–1830, when the Catholic Emancipation Act was passed, and was pronounced by Sir Robert Peel "the best chief governor that ever presided over the affairs of Ireland." Both he and his brother Algernon, 4th duke (1792–1865), who was created Baron Prudhoe in 1816, died without issue; the barony of Percy devolved on their great-nephew, the duke of Atholl, and the dukedom passed to George (1778–1867), eldest son of Algernon, 1st earl of Beverley, and so to his son, the 6th duke (1810–1899), and grandson, the 7th duke (1846–1918).

See Edward Barrington de Fonblanque, *The House of Percy* (2 vols., 1887); G. E. C(okayne), *Complete Peerage,* vol. vi. (1895).

NORTHUMBERLAND, ALAN IAN PERCY, 8TH DUKE OF (1880–1930), was born on April 17, 1880, a son of the 7th duke. He succeeded to the title in 1918. As one of the largest coal-owners in the north of England, he was summoned to appear as a witness before the Sankey Coal Commission (1919) and came much into public notice owing to his prolonged controversy with Robert Smillie, the leader of the miners, and subsequently to his anti-Communist campaign. In 1924 the duke acquired an interest in *The Morning Post* newspaper, sold by Lady Bathurst. He died Aug. 23, 1930.

NORTHUMBERLAND, JOHN DUDLEY, VISCOUNT LISLE, EARL OF WARWICK, and DUKE OF (*c.* 1502–1553), was the eldest son of Henry VII.'s minister, Edmund Dudley (*q.v.*), by his second wife Elizabeth, daughter of Edward Grey, Viscount Lisle, and co-heiress of her brother John, Viscount Lisle. He was probably descended from the old baronial house of Sutton *alias* Dudley; but his father's attainder and execution in 1509 clouded his prospects. His mother, however, married as her second husband in 1511 Arthur Plantagenet, the illegitimate son of Edward IV., who in 1523 was created Viscount Lisle in his wife's right; and Lisle's rise in Henry VIII.'s favour brought young Dudley into prominence. In 1512 he was restored in blood, and in 1538 he was made deputy to his step-father, who was governor of Calais, and he does not appear to have suffered by Lisle's temporary disgrace and imprisonment in the Tower. Lisle died early in 1542, and Dudley was created Viscount Lisle on March 12 and was made warden of the Scottish marches in November, and lord high admiral of England in 1543 in succession to his future rival, Edward Seymour, earl of Hertford. He was also created a knight of the garter and sworn of the privy council. In 1544 he accompanied Hertford to the capture and burning of Edinburgh. On the capture of Boulogne in September Lisle was given command of the town and of the Boulonnais; in 1545 he directed the operations of the fleet in the Solent which foiled the French attack on Portsmouth and the Isle of Wight; and he was sent to Paris to ratify the peace concluded in 1546.

Lisle had thrown in his lot with the reforming party, and he took an active share in the struggle at Henry VIII.'s court for control of affairs when Henry should die. Hertford and he were described by the Spanish ambassador as holding the highest places in Henry VIII.'s affections and as being the only noblemen of fit age and ability to carry on the government. The Howards were infuriated by the prospect, and Surrey's hasty temper ruined their prospects. Lisle quarrelled bitterly with Bishop Gardiner, served as commissioner at Surrey's trial, and was nominated one of the body of executors to Henry's will from which Norfolk and Gardiner were excluded. On Henry's death Lisle was raised to the earldom of Warwick and promoted to be lord great chamberlain of England, again in succession to Hertford, who became duke of Somerset and Protector. He accompanied Somerset on his Pinkie campaign, and materially contributed to the winning of that victory. Nor did he exhibit any sympathy with the intrigues of the Protector's brother, Thomas Seymour, the lord high admiral; his subtler policy was to exasperate the brothers and thus weaken the influence of the house of Seymour. He helped to bring the admiral to the block in March 1549; and then used the Protector's social policy to bring about his deposition. Warwick detested Somerset's ideas of liberty and his championship of the peasantry against the inclosure movement; one of his own parks was ploughed up as a result of a commission of enquiry which Somerset appointed; and when the peasants rebelled under Kett, Warwick gladly took the command against them. His victory at Dussindale made him the hero of the landed gentry, and as soon as he had returned to London in Sept. 1549, he organized the general discontent with the Protector's policy into a conspiracy. He played upon the prejudices of Protestants and Catholics alike, holding out to one the prospect of more vigorous reform and to the other hopes of a Catholic restoration, and to all gentry the promise of revenge upon the peasants.

The coalition thus created effected Somerset's deposition and imprisonment in Oct. 1549; and the parliament which met in November carried measures of political coercion and social reaction. But the coalition split upon the religious question. Warwick threw over the Catholics and expelled them from office and from the privy council, and the hopes they entertained were rudely dashed to the ground. But it was difficult to combine coercion of the Catholics with the proscription of Somerset; the duke was therefore released early in 1550 and restored to the privy council; and his daughter was married to Warwick's son. Warwick himself assumed no position of superiority over his colleagues, and he was never made protector. But he gradually packed the council with his supporters, and excluded his enemies from office and from access to the king. His plan was to dominate Edward's mind, and then release him from the trammels of royal minority. He abandoned the Tudor designs on Scotland, and made a peace with France in 1550 by which it recovered Boulogne and was left free to pursue its advantage in Scotland. Nor did the betrothal of Edward to Henry's daughter Elizabeth prevent the French king from intriguing to undermine English influence in Ireland. In domestic affairs Warwick pushed on the Reformation with none of the moderation shown by Somerset; and the difference between the two policies is illustrated by the change effected between the first and second Books of Common Prayer. Warwick, however, was widely distrusted; and the more arbitrary his government grew, the more dangerous became Somerset's rivalry. A parliamentary movement had early been started for Somerset's restoration. Warwick therefore kept parliament from meeting, and the consequent lack of supplies drove him into the seizure of church plate, sale of chantry lands, and other violent financial expedients. At length he resolved to get rid of his opponent; his opposition was magnified into conspiracy, and in Oct. 1551, after Warwick had made himself duke of Northumberland and his ally Dorset, duke of Suffolk, and had scattered other rewards among his humbler followers, Somerset was arrested, condemned by the peers on a charge of felony, and executed (Jan. 22, 1552).

Parliament was permitted to meet on the following day, but for the next 18 months Northumberland grew more and more unpopular. He saw that his life was safe only so long as he con-

trolled the Government and prevented the administration of justice. But Edward VI. was slowly dying, and Northumberland's plot to alter the succession was his last desperate bid for life and power. Its folly was almost delirious. Edward had no legal authority to exclude Mary, and the nation was at least nine-tenths in her favour. Northumberland bullied the council and overawed London for a few days; but the rest of England was in an uproar, and as he rode out to take the field against Mary, not a soul cried "God speed." A few days later he returned as Mary's prisoner. He was tried for treason, professed himself a Catholic in the delusive hope of pardon, and was executed on Aug. 22. He was a competent soldier and one of the subtlest intriguers in English history; but he had no principles. The violence of his pretended Protestantism was largely responsible for the reaction of Mary's reign. His best-known son was Robert Dudley, earl of Leicester, Queen Elizabeth's favourite.

NORTHUMBERLAND, JOHN NEVILLE, Earl of (*c.* 1430–1471), English soldier, was the third son of Richard Neville, earl of Salisbury, and a brother of Richard Neville, earl of Warwick, the "king-maker." In 1459–61 he was twice a prisoner of the Lancastrians and in 1463 as warden of the east marches towards Scotland, he was responsible for the Yorkist victories at Hedgeley Moor and at Hexham in April and May 1464. In this year (1464) he was created earl of Northumberland, the Percies being now crushed, and their head, Henry Percy, being in prison. Northumberland did not at first join his brother Warwick and the other Nevilles when they revolted against Edward IV., but neither did he help the king. Edward, doubtless suspecting him, restored the earldom of Northumberland and its vast estates to Henry Percy, while John Neville's only recompense was the barren title of marquess of Montagu. At Pontefract in 1470 he and his men declared for Henry VI., a proceeding which compelled Edward IV. to fly from England, and under the restored king he regained his position as warden, but not the earldom of Northumberland. He did not attempt to resist Edward IV. when this king landed in Yorkshire in March 1471, but he fought under Warwick at Barnet, where he was slain on April 14, 1471.

NORTHUMBERLAND, the northernmost county of England. The area, included in the North of England basin, is 2,018.7 sq.mi. The higher land, including the north Pennines and the Cheviots, lies in the west and north. The Cheviot hills, rising to 2,676 ft., are formed by the intrusion of an igneous dome in Tertiary times, and between them and the northern Pennines we have the lower line of the Tyne Gap, giving an important way for routes from west to east. The larger rivers generally flow eastward, the chief exception being the Till which flows northward, to join the Tweed, along a bed of shales less resistant than the remainder of the region.

The number of weapons of Neolithic age which have been found in the county show that it was occupied by man in those times. Most implements have been found along a broad band of country north-eastward from Hexham to Alnwick, that is, along the lower levels of the limestone lands. In later times, the evidence of beaker-pottery shows that Northumberland was probably invaded from across the North sea at the dawn of the Metal age. The evidence for the pre-Roman Iron age is not great and the Bronze age may have continued far longer than in the south of England. The county was occupied by the Romans some time after A.D. 80 and about 124. Hadrian built his wall from the Tyne to the Solway to defend his northern frontier, but the region as a whole was not thoroughly Romanized like the south-eastern parts of Britain. Hadrian's wall marked the frontier south of which the Romans never retreated until they finally left Britain, but they often advanced farther north which northern region was crossed by military roads. The wall ran across the county a few miles north of the Tyne from near Haltwhistle to Wallsend. On the wall there was the fort of Magnae, near Haltwhistle, where the road from Kirkby Thore along the south Tyne abutted on the wall. There was a settlement at Corbridge where the main road from the south crossed the Tyne and a fort near Halton where the road met the wall. At the eastern end of the wall there was a fort and another at Newcastle guarding a route across the Tyne. Within the wall, from Halton to Magnae through the Tyne Gap, ran another road.

History.—The first English settlement in the kingdom of Bernicia, which included what is now Northumberland, was effected in 547 by Ida, who pushed through the narrow strip of territory between the Cheviots and the sea, and set up a fortress at Bamburgh, which became the royal seat of the Saxon kings. About the end of the 6th century Bernicia was first united with the rival kingdom of Deira under the rule of Aethelfrith, and the district between the Humber and the Forth became known as the kingdom of Northumbria. In 634 Cadwalla was defeated at Hefenfeld (the site of which lies in the modern parish of St. John Lee) by Oswald, under whom Christianity was definitely established in Northumbria, and the bishop's see fixed at Hexham, where Bishop Wilfrid erected the famous Saxon church. Oswald also erected a church of stone at Tynemouth, which was destroyed in 865 in an incursion of the Danes. The Danes later overran the region, but in Northumberland, the English princes continued to reign at Bamburgh as vassals of the Danes, and not a single place-name with the Danish suffix "by" or "thorpe" is found north of the Tyne. The English names are, however, often associated with those of Gaelic or Cymric origin. In 938 Aethelstan annexed Northumberland to his dominions, and the Danish authority was annulled until its re-establishment by Canute in 1013. The vigorous resistance of Northumbria to the Conqueror was punished by ruthless harrying. The Normans rebuilt the Saxon monasteries of Lindisfarne, Hexham and Tynemouth; Eustace Fitz John founded Alnwick abbey, and other Norman abbeys were Brinkburn, Hulne, the first Carmelite monastery in England, Blanchland and Newminster. Castles were set up at Alnwick, Warkworth, Prudhoe, Dunstanborough, Morpeth, Ford, Chillingham, Langley, Newcastle, Bamburgh, Wark and Norham, a stronghold of the palatine bishops of Durham.

The term Northumberland is first used in its contracted modern sense in 1065 in an entry in the Saxon Chronicle relating to the northern rebellion. The county is not mentioned in the Domesday Survey, but the account of the issues of the county is entered in the Great Roll of the Exchequer for 1131. In the reign of Edward I. the county of Northumberland comprised the whole district between the Tees and the Tweed, and included liberties belonging to the bishop of Durham, archbishop of York, the king of Scotland, the earl of Lancaster and the earl of Angus. These franchises were all held exempt from the ordinary jurisdiction of the shire. By statute of 1495–96 the lordship of Tynedale was annexed to Northumberland on account of flagrant abuses of the liberties of the franchise; that of Hexham in 1572; Norhamshire, Islandshire and Bedlingtonshire continued to form detached portions of Durham until 1844, when they were incorporated with Northumberland. The division into wards existed at least as early as 1295, the Hundred Roll of that year giving the wards of Coquetdale, Bamburgh, Glendale and Tynedale.

The shire-court for Northumberland was held at different times at Newcastle, Alnwick and Morpeth, until by statute of 1549 it was ordered that the court should thenceforth be held in the town and castle of Alnwick. The assizes were held at Newcastle, and the itinerant justices, on their approach to the county, were met by the king of Scotland, the archbishop of York, the bishop of Durham and the prior of Tynemouth, who pleaded their liberties either at a well called Chille near Gateshead, if the justices were proceeding from York, or, if from Cumberland, at Fourstanes. In these franchises the king's writ did not run, and their owners performed the office of sheriff and coroner. The burgesses of Newcastle claimed return of writs in their borough and the town was made a county by itself by Henry IV. in 1400, and has jurisdiction in admiralty cases. The county was in the diocese of Durham, but in 1882 Northumberland was formed into a separate diocese with its see at Newcastle. Northumberland was the scene of perpetual inroads by the Scots, and the churches were

often so built as to form refuges against the invaders. Norham, Alnwick and Wark were captured by David of Scotland in the wars of Stephen's reign, and in 1290 it was at Norham castle that Edward I. decided the Scottish succession in favour of John Baliol.

In 1295 Robert de Ros and the earls of Athol and Menteith ravaged Redesdale, Coquetdale and Tynedale. In 1314 the county was ravaged by Robert Bruce, and in 1382 by special enactment the earl of Northumberland was ordered to remain on his estates in order to protect the county from the Scots. In 1388 Henry Percy was taken prisoner and 1,500 of his men slain at the battle of Otterburn. Alnwick, Bamburgh and Dunstanborough were garrisoned for the Lancastrian cause in 1462, but after the Yorkist victories of Hexham and Hedgley Moor in 1464, Alnwick and Dunstanborough surrendered, and Bamburgh was taken by storm. In 1513 the king of Scotland was slain in the battle of Flodden Field on Branxton moor. During the Civil War of the 17th century Newcastle was garrisoned for the king by the earl of Newcastle, but in 1644 it was captured by the Scots under the earl of Leven, and in 1646 Charles was led there a captive under the charge of David Leslie. The county of Northumberland was represented by two members in the parliament in 1290, and in 1295 Bamburgh, Corbridge and Newcastle-upon-Tyne each returned two members. Today, the parliamentary divisions of the county are Berwick-upon-Tweed, Hexham and Wansbeck, each returning one member; while the parliamentary borough of Newcastle-upon-Tyne returns four members, and Morpeth, Wallsend and Tynemouth one each.

Industries and Agriculture.—The early industrial development of Northumberland was much impeded by the constant ravages of internal and border warfare. Again Aeneas Sylvius Piccolomini (Pope Pius II.) who passed through the county disguised as a merchant in 1436, leaves a picture of its barbarous and desolate condition, and as late as the 17th century, Camden, the antiquary, describes the lands as rough and unfit for cultivation. The mineral resources, however, appear to have been exploited to some extent from remote times. It is certain that coal was used by the Romans in Northumberland. In a 13th-century grant to Newminster abbey a road for the conveyance of seacoal from the shore about Blyth is mentioned, and the Blyth coal-field was worked throughout the 14th and 15th centuries. The coal trade on the Tyne did not exist to any extent before the 13th century, but from that period it developed rapidly, and Newcastle acquired the monopoly of the river shipping and coal trade. The building of ships to carry the coal laid the foundations of the great modern shipbuilding industries. Lead was exported from Newcastle in the 12th century, probably from Hexhamshire, the lead mines of which were very prosperous throughout the 16th and 17th centuries. In a charter from Richard I to Bishop Puiset creating him earl of Northumberland, mines of silver and iron are mentioned, and in 1240 the monks of Newminster had an iron forge at Stretton. A saltpan is mentioned at Warkworth in the 12th century; in the 13th century the salt industry flourished at the mouth of the river Blyth, and in the 15th century formed the principal occupation of North and South Shields.

In the reign of Elizabeth glasshouses were set up at Newcastle by foreign refugees, and the industry spread rapidly along the Tyne. Tanning, both of leather and of nets, was largely practised in the 13th century, and the salmon fisheries in the Tyne were famous in the reign of Henry I. The height of the land and the composition of the soil together prevent the county from being rich agriculturally. In 1939 the total area under crops and grass was 640,153 ac., of which 133,771 ac. were arable land. As would be expected in a northern county, the chief grain crops are oats (27,720 ac. in 1939) and barley (9,929 ac.), though turnips and swedes occupied 15,681 ac. Potatoes covered nearly 5,000 ac., and the area under clovers and rotation grasses for hay was 30,921 ac. The number of cattle is fairly large, but the great acreage of hill-land makes it pre-eminently a sheep country, these animals numbering 1,147,383 in 1939. Manufactories centre on the Tyne, which is a region of ironworks, blast furnaces, shipbuilding yards, ropeworks, coke ovens, chemical works and manufactories of glass, electrical apparatus, pottery and firebricks, from above Newcastle to the sea. Machines, appliances, conveyances and tools are the principal articles of manufacture in metal. The National Trust owned 339 ac. in the county in 1942, besides the Wallington estate of 13,000 ac. presented by Sir Charles Trevelyan in that year. Communications are provided almost wholly by the L.N.E. Ry. The area of the administrative county is 1,994.1 sq.mi., with a population (1938) of 405,900. The population of the county was reduced 5% between Sept. 1939 and Feb. 1941 owing to wartime movements. Normally it is especially dense in the southeast portion, where the mining district and the Tyneside industrial area are situated. The latter area was particularly affected by the depression of the 1930s and was included in the "Special Area" over which a commissioner was appointed under the act of 1934. There are two county boroughs, Newcastle-upon-Tyne (a city) and Tynemouth; four municipal boroughs, Berwick-upon-Tweed (a county of itself), Blyth, Morpeth and Wallsend; and 12 urban districts. The county is in the northern circuit, and assizes are held at Newcastle. There is one court of quarter sessions for the county and one for Berwick and there are 13 petty sessional divisions.

NORTHUMBERLAND, a manufacturing borough of Northumberland county, Pennsylvania, U.S.A., immediately north of Sunbury, at the confluence of the east and west branches of the Susquehanna river. It is served by the Lackawanna, the Pennsylvania and the Reading railways.

Pop. (1950) 4,176; (1940) 4,469 by federal census. Northumberland was the home of Joseph Priestley, the English chemist, from 1794 until his death (1804), and his dwelling has been preserved as a memorial.

NORTHUMBRIA, one of the most important of the Anglo-Saxon kingdoms, extended from the Humber to the Forth (*regnum Northanhymbrorum*). Originally it comprised two independent kingdoms, Bernicia and Deira (*q.v.*), each of which had a dynasty of its own. The first known king of the former was Ida, who, according to tradition, acquired the throne in 547 and reigned twelve years. To him the foundation of Bamburgh is attributed Four of Ida's sons successively occupied his throne: Glappa 559–560, Adda 560–568, Aethelric 568–572 and Theodoric 572–579. Of the first three nothing is known, but Theodoric is said (*Historia Brittonum*) to have been besieged by the Welsh under Urien in Lindisfarne. Theodoric was succeeded by Frithuwald 579–585/6 and Hussa 586–592/3. Then Aethelfrith (*q.v.*), son of Aethelric, came to the throne. He greatly extended his territories at the expense of the Welsh, and eventually provoked an invasion of Aidan, king of the Scots, whom he defeated at a place called Daegsastan (603). The first king of Deira of whom we know was Ella, or Aelle, who, according to Bede, was still reigning when Augustine arrived in 597. Aethelfrith eventually acquired possession of Deira, expelling Aelle's son Edwin (*q.v.*). Thenceforward, with rare intervals, the two kingdoms remained united.

Aethelfrith became involved in war with the Welsh towards the end of his reign and captured Chester, probably about 613. Shortly afterwards, in 616, he was slain in battle on the river Idle by Edwin, who was assisted by the East Anglian king Raedwald. Edwin now became king over both Northumbrian provinces. By his time the kingdom must have reached the west coast, as he is said to have conquered the islands of Anglesea and Man. Under Edwin the Northumbrian kingdom became the chief power in the country. At his death in 633 the kingdom was again divided, Deira falling to his nephew Osric, while Bernicia was occupied by Eanfrith son of Aethelfrith. Both these kings were slain by Cadwallon in the following year, but shortly afterwards the Welsh king was overthrown by Oswald (*q.v.*), brother of Eanfrith, who reunited the whole of Northumbria under his sway and acquired a supremacy analogous to that previously held by Edwin. After Oswald's defeat and death at the hands of Penda in 642 Bernicia fell to his brother Oswio, while Oswine son of Osric became king in Deira, though probably subject to Oswio. Oswine's death was compassed by Oswio in 651, and the throne of Deira was then obtained by Aethelwald son of Oswald. He is not mentioned, however, after

655, so it is probable that Deira was incorporated in the Bernician kingdom not long afterwards. After Oswio's victory over Penda in 654–655 he acquired a supremacy over the rest of England similar to that held by his predecessors. The Mercians, however, recovered their independence in 658, and from this time onward Northumbria played little part in the history of southern England. But Oswio and his son Ecgfrith greatly extended their territories towards the north and north-west, making themselves masters of the kingdoms of Strathclyde and Dalriada, as well as of a large part of the Pictish kingdom. Ecgfrith (*see* EGFRITH), who succeeded on Oswio's death in 671, expelled the Mercians from Lindsey early in his reign, but was in turn defeated by them in 679, his brother Aelfwine being slain. From this time onwards the Humber formed the boundary between the two kingdoms. In 684 we hear of the first English invasion of Ireland, but in the following year Ecgfrith was slain, and his army totally destroyed by the Picts at a place called Nechtansmere (probably Dunnichen Moss in Forfarshire). The Picts and Britons now recovered their independence; for Aldfrith, apparently an illegitimate son of Oswio, who succeeded, made no attempt to reconquer them. He was a learned man, and during his reign the Northumbrian kingdom partially recovered its prosperity. He was succeeded in 705 by his son Osred, and under him and his successors Northumbria began rapidly to decline through the vices of its kings. Osred was slain in 716. He was succeeded by Coenred 716–718, and Coenred by Osric 718–729. The next king was Ceolwulf, to whom Bede dedicated his *Historia Ecclesiastica* in 731. In the same year he was deposed and forced to become a monk, but was soon restored to the throne. In 737 he voluntarily retired to a monastery and left the kingdom to his cousin Eadberht. The latter appears to have been a vigorous ruler; in the year 740 we hear of his being involved in war with the Picts. Aethelbald of Mercia seems to have taken advantage of this campaign to ravage Northumbria. In 750 Eadberht is said to have annexed a large part of Ayrshire to his kingdom. Finally in 756, having now allied himself with Oengus king of the Picts, he successfully attacked Dumbarton (Alcluith), the chief town of the Britons of Strathclyde. Eadberht showed considerable independence in his dealings with the church, and his brother Ecgberht was from 734 to 766 archbishop of York. In 758 Eadberht resigned the kingdom to his son Oswulf, and became a monk.

Oswulf was slain by his household at a place called Mechil Wongtun in 759. Moll Aethelwald, who may have been a brother of Eadberht, succeeded, and after a victory over a certain Oswine, who fell in the battle, abdicated and became a monk probably under compulsion in 765. His successor Alchred sent an embassy to Charlemagne in 768 and was deposed in 774, whereupon he fled to Bamburgh and afterwards to the Picts. His deposition has been ascribed to a formal act of the Witan, but this seems an antedating of constitutional methods and the circumstances point to a palace revolution. The successor of Alchred was Aethelred son of Moll Aethelwald. In 778 three high-reeves were slain at the instigation of the king. Aethelred was expelled during the next year, perhaps in consequence of this event, and Aelfwald son of Oswulf became king. Aelfwald was murdered by Sicga in 789, whereupon Osred his nephew the son of Alchred succeeded. In 790 the banished Aethelred returned to the throne and drove out Osred, whom he put to death in 792. Aethelred, who had married Aelflaed the daughter of Offa, also killed Aelf and Aelfwine, the sons of Aelfwald and was murdered himself at Corbridge in 796. Oswald, who is called *patricius* by Simeon of Durham, succeeded, but reigned only twenty-seven days, when he was expelled and eventually became a monk. Eardwulf *dux*, who had apparently fled abroad to escape the wrath of Aethelred, was now recalled and held the crown until 807 or 808. Aelfwald then became king but Eardwulf was restored in 808 or 809 after appealing to the emperor and the pope. Eanred, son of Eardwulf, probably came to the throne in 809 and reigned until 841. It was during his reign in 827 that Northumbria acknowledged the supremacy of Ecgberht, king of Wessex. Eanred was succeeded by his son Aethelred, who was slain in 850, when Osberht came to the throne and reigned until 863. On the expulsion of Osberht, Ella or Aelle, succeeded. The chroniclers emphasize the fact that this king was not of royal descent. He is said to have slain Ragnarr Loðbrok. In the year 866 Loðbrok's sons Ingwaere (Ivarr, *q.v.*), Healfdene, Ubba and others brought a vast army to England to avenge the death of their father. In the following year they obtained possession of York. Ella seems now to have made peace with the exiled king Osberht, and their united forces succeeded in recovering the city. In the great battle which ensued the Northumbrian army was annihilated and both kings were slain (the death of Ella, according to Irish tradition, being due to the treachery of one of his followers). The southern part of Northumbria now passed entirely into the hands of the invaders, but they allowed a certain Ecgberht to reign over the portion of the kingdom north of the Tyne. Ecgberht was expelled in 872 and died in the course of the following year. His successor Ricsig died in 876 and was followed by Ecgberht II., who reigned until 878. He was the last English king who reigned in Northumbria. After him the chief power north of the Tyne came into the hands of a certain Eadulf of Bamburgh, who did not take the kingly title, but accepted the overlordship of Alfred the Great perhaps in 886. In the winter of 874–75 Healfdene returned to Northumbria, which he partitioned next year among his followers. After an interregnum of a few years a certain Guthred became king in 883. He is said to have been a slave and to have been appointed king at the command of St. Cuthbert who appeared to Eadred the abbot of Carlisle in a dream. There is some reason for the conjecture that he belonged to the family of Loðbrok. He died in 894, after which date little is known of Northumbrian history for some years.

About 919 the country was invaded by vikings from Ireland under Ragnall, grandson of Ivarr, who seized York and occupied the lands of St. Cuthbert. Aldred, the son of Eadulf, who now ruled north of the Tyne, appealed to Constantine II., king of the Scots, for help, but the Scottish and Northumbrian armies were defeated at Corbridge. Shortly after this, however, all the northern princes submitted to Edward the Elder. Ragnall was succeeded by Sihtric, who married Aethelstan's sister. He died in 926, and his brother and successor Guthfrith was soon afterwards expelled by Aethelstan and fled to Eugenius, king of Strathclyde. The Welsh and Scottish kings, however, both submitted to Aethelstan, and Guthfrith was again driven into exile. He died in 934, leaving a son Anlaf (Olafr) Godfredsson or Godfreyson. In 934 Aethelstan invaded Scotland as far as the Tay. In 937 a great fleet and army were brought together by Constantine and Anlaf Godfreyson from Ireland. Aethelstan, however, won a complete victory over them at a place called Brunanburh. Anlaf Godfreyson escaped to Ireland but returned to England after Aethelstan's death, occupied York and compelled Edmund to cede to him all Danish Mercia north of Wattling street. He died in 941, and a series of obscure Scandinavian kings of York followed him until 954 when Northumbria was conquered by Edred king of Wessex. Eadred placed Northumbria in the hands of a certain Osulf, who is called high-reeve at Bamburgh. In the reign of Edgar, Oslac was appointed earl of southern Northumbria, but he was banished at the beginning of the following reign. The next earl was Waltheof and after him Uhtred, who defeated Malcolm II., king of the Scots, in 1006. Twelve years later, however, the Northumbrians were completely defeated at Carhan, and Lothian was annexed by the Scots (*see* LOTHIAN). Uhtred was slain by the orders of Canute, who gave the province to Eric (Eirikr) earl of Lade. Shortly afterwards, however, part of it at least came into the hands first of Eadulf and then of Aldred and another Eadulf, the brother and sons respectively of Uhtred. The younger Eadulf was slain by Siward, probably in the reign of Harltacuut. Siward held the earldom till his death in 1055, when it was given to Tostig, son of earl Godwine, and after his banishment to Morkere, son of Aelfgar, earl of Mercia. Tostig's banishment led to the invasion of Harold Hardrada, king of Norway, and the battle of Stamford Bridge, in which both perished.

NORTHWESTERN UNIVERSITY, an institution of higher learning, privately controlled, coeducational, was established in 1851 through a charter from the Illinois general assembly. The founders planned an institution that would "meet adequately the growing want in the Northwest for a university of the highest grade, adapted to the country." No particular religious faith is required of students or faculty, although a majority of members of the board of trustees must be members of the Methodist Church.

The university maintains two campuses, both of which are located on the shores of Lake Michigan: one in the residential suburb of Evanston, 12 mi. N. of Chicago's central business district, and the other on Chicago's near north side at Lake Shore drive and Chicago avenue.

The undergraduate programs are confined to the Evanston campus. The professional schools are located on the Chicago campus. There the school of law is close to the law courts, to large business organizations and to the various departments and agencies of the city, state and federal governments; and the schools of medicine and dentistry have at hand an abundant supply of clinical material for their programs of teaching and research.

Among the founders of the university was John Evans, for whom the city of Evanston was named. In 1853 he, with Orrington Lunt, selected as the site for the new university a wooded 379-ac. tract of land on the shore of Lake Michigan. The city of Evanston grew up around the university.

The first building of the university, Old College, was erected and the first class was held in Nov. 1855. The trustees provided an endowment consisting of 678 ac. of Evanston land, which was tax-exempt by an amendment to the university's charter. This land was subdivided and sold as lots.

The original school of the university was the college of liberal arts. Other schools, offering training for the various professions, were added in the years that followed: medicine (1859), law (1859), speech (1878), dentistry (1891), music (1895), commerce (1908), graduate (1910), summer session (1920), journalism (1921), education (1926), university college (1933) and the technological institute (1939).

The growth of the university after 1920 was striking. The faculty increased from 553 to more than 1,000 members at mid-century; full-time students from 4,653 to about 9,000; part-time students from 4,265 to more than 16,000; bound volumes in the libraries from 197,999 to more than 1,000,000; and assets from $11,960,000 to more than $100,000,000. Endowments at mid-century exceeded $70,000,000.

The Chicago campus was dedicated in 1926 and at mid-century comprised eight large buildings: Montgomery Ward Memorial building (1926), the home of the medical and dental schools and the university college; Wieboldt hall (1926), housing the evening divisions of the schools of commerce and journalism; Levy Mayer hall (1926), home of the school of law; Elbert H. Gary Law Library building (1926); the Floyd D. Patterson Memorial building, housing the Passavant Memorial hospital (1929); Thorne hall (1931); Abbott Hall (1940), an 18-story dormitory; and Wesley Memorial hospital (1941).

The technological institute building was completed in the fall of 1941 at a cost, including equipment, of $6,000,000, made possible by a gift from Walter P. Murphy, railway-supply manufacturer.

Upon his death in 1942 Murphy bequeathed to the university more than $25,000,000 to endow the program of the institute. The institute has curriculums in mechanical, chemical, civil, electrical and industrial engineering. It is operated on the co-operative plan under which a student alternates a quarter of classroom study with a quarter of work in industry. During the five-year program the student completes 12 quarters of academic work and 6 quarters in industry.

In 1947 the university established the Institute for the Study of Rheumatic Fever, the first of its kind to be established in any school of medicine in the United States.

Another development in medical research was the Institute of Human Nutrition for the study of nutritional diseases. The institute is housed in a nine-story building near the Chicago campus.

The university observed its centennial in 1951 with a year-long series of academic conferences, convocations and other special events. (E. H. SG.)

NORTH-WEST FRONTIER PROVINCE, the most northerly province of Pakistan, created during British rule in India. Roughly it may be defined as the tract of country north of Baluchistan, lying between the Indus and Afghanistan. More exactly it consists of (1) the cis-Indus district of Hazara; (2) the comparatively narrow strip between the Indus and the hills constituting the settled districts of Peshawar, Kohat, Bannu and Dera Ismail Khan; and (3) the rugged mountainous region between these districts and the borders of Afghanistan, which is inhabited by independent tribes. This last region is divided into five agencies: Dir, Swat and Chitral with headquarters at Malakand, Khyber, Kurram, Tochi and Wana.

The province lies between lat. 31° 4′ and 36° 57′ N. and long. 69° 16′ and 74° 7′ E. The approximate area is 39,186 sq.mi.

Physiography.—The mountains of the Hindu Kush, running from east to west, form the northern boundary of the province and are met at the northeastern corner of Chitral by the continuation of an outer chain of the Himalayas after it crosses the Indus above the Kagan valley. From this chain, minor ranges run in a southwesterly direction the whole length of Bajour and Swat, till they merge into the Mohmand hills and connect the mid-Himalayas with the Safed Koh. The Suliman system lies south of the Gomal unconnected with the northern hills. To the east the Safed Koh extends its spurs into the Kohat district. The Salt range crosses the Indus in the Mianwali *tahsil* of the Punjab and forms the boundary between Bannu and Dera Ismail Khan, merging eventually in the Waziri hills.

The Dera Ismail Khan district is one of the hottest areas in the Indian subcontinent, while over the mountain region to the north the weather is temperate in summer and intensely cold in winter.

There are two seasons of rainfall over the province; the monsoon season, when supplies of moisture are brought up by the ocean winds from the Arabian sea and the Bay of Bengal, and the winter season, when storms advancing eastward from Iran and the Caspian districts cause winds, widespread rain and snowfall. Both sources are precarious and instances are not infrequent of the almost entire failure of either the winter or the summer rainfall.

History.—The origin of the Pathans is obscure. It is clear, however, that many tribes of foreign origin were early gathered around the nucleus of the true Pathans, with whom they became blended. In the 15th century they began to descend from the hills to the plains. Their spirit of independence soon brought them into collision with the Mogul empire. In the 17th century the settlers in the plains wrested terms from Aurangzeb which left them almost as independent as their brothers in the hills. The invasion in 1738 of Nadir Shah, who traversed the province from Peshawar to Dera Ismail Khan, is a landmark in the history of the frontier. From his death to the rise of Ranjit Singh, the frontier districts remained an appendage of the Durrani empire. Little control was exercised by Kabul, and the country was administered by local chiefs or Afghan sirdars very much as they pleased. The Sikh invasions began in 1818. After the Second Sikh War, by the proclamation of March 29, 1849, the frontier districts were annexed by the British government. Then the settled districts were taken into the Punjab, while the independent tribes were controlled at different times by the Punjab government and the government of India. Their turbulence still continued, and they were the object of more than 50 punitive expeditions after 1849. The proposal to make the frontier districts into a separate province dates back to Lord Lytton's minute of April 22, 1877, as a result of which a frontier commissionership, including Sind, was sanctioned by the home government. The outbreak of

the Second Afghan War caused the project to be postponed, but it was eventually brought to completion, on Oct. 25, 1901, by Lord Curzon, whose scheme was more modest than Lord Lytton's It omitted Sind altogether and, with the exception of the cis-Indus tract of Hazara, confined the new province to the Pathan trans-Indus districts north of the Gomal. (*See* INDIA: *History*.)

Population.—The census of 1941 gave the population of the administered area as 3,038,067, that of the tribal as 2,500,000. The first census of Pakistan (1951) gave the administered area 3,239,000, the tribal 2,460,000. The province is mainly agricultural. The towns, except Peshawar and Dera Ismail Khan, are either expansions of large agricultural villages or bazaars which grew up around the many cantonments of the province. The great majority of the population are Pathan (*q.v.*) by race and Mohammedan by religion. The chief tribes, in addition to Chitralis and Bajouris, are the Utman Khel, Yusafzais, Hassanzais, Mohmands, Afridis, Jowakis, Mullagoris, Orakzais, Zaimuks, Chamkannis, Khattaks, Bangash, Turis, Bhittannis, Darwesh Khel Waziris and Sheranis. The predominant language is Pushtu.

Agriculture.—The limit of profitable cultivation had, by the middle of the 20th century, almost been reached. The Pathan, however, is a slovenly cultivator and slow to adopt new methods. The principal crops are maize and *bajra* in the cold weather; wheat, barley and gram in the spring. Rice and sugar cane are largely grown on the irrigated lands of Hazara, Peshawar and Bannu districts, and the well- and canal-irrigated tracts of Peshawar district produce fine crops of cotton and tobacco. In the transborder agencies the valleys of the Swat, Kurram and Tochi yield much rice.

Canals are the main source of irrigation in the province, and fall under three heads: (1) private canals in the various districts, the property of the people and managed on their behalf; (2) the Michni Dilazak and Shabkadar branch in Peshawar, constructed by the district board, which receives water rates; and (3) the Swat and Kabul river canals, which were constructed by and are the property of government and are managed by the irrigation department.

See C. C. Davies, *Problem of the North-West Frontier* (Cambridge, 1932). (T. H. H.; X.)

NORTHWEST TERRITORIES, official name of the portion of Canada lying outside the provinces and to the north of them, but excluding the Yukon Territory (*q.v.*). The territories extend from their apex at the north pole to the 60th parallel of north latitude. The boundary of the territories, beginning at the north pole, follows the 141st meridian to the mainland, thence along the coast to a point about 136° 30′ W., south to the 67th parallel, east to about 134° and thence along the divide separating the watersheds of the Peel and the Yukon from the Mackenzie to the 60th parallel; thence along that parallel to Hudson bay and thence through Hudson strait to the open sea; down the straits and channels separating Greenland from the arctic archipelago and along the 60th meridian of west longitude to the apex of Canada at the north pole. The offshore islands in Hudson and James bays and the arctic archipelago are included in the territories. The territories were divided into the districts of Mackenzie and Keewatin, on the mainland, respectively east and west of the meridian 102° W., and the district of Franklin, covering the arctic archipelago. The divisions were made merely for administrative convenience. Total area, 1,304,903 sq.mi.

History.—The territories represent in origin, though not in boundaries, the area handed over to the jurisdiction of the Hudson's Bay company under its charter of 1670. This area included all the land drained by rivers flowing to Hudson bay and the Arctic ocean—roughly speaking, all of Canada from the Rocky mountains to the St. Lawrence watershed. The term Rupert's Land was the original official name of the whole area, but the name Hudson's Bay Territory early began to replace it in common speech. The name Northwest Territory was used to mean the western half and Rupert's Land the east.

These were names current at the time of the confederation in 1867 and were adopted by the British North America act in providing for their inclusion in the dominion. But the area now known as the territories was quite unknown and unexplored except for the coast of Hudson bay, for a century after the charter of 1670. The company traded by way of the Hudson bay, but their posts were established on the Churchill, Nelson, Red, Saskatchewan and other rivers, at points entirely within Manitoba and Saskatchewan. Further exploration began with the journeys of Samuel Hearne, a company employee, northwestward from Fort Churchill across the barren lands. In his third journey (1770–72) he discovered the Coppermine river, reached the arctic coast and brought home a 4-lb. lump of copper. His explorations were followed by those of Sir Alexander Mackenzie, in the service of the Northwest company. Mackenzie discovered and descended the river named after him and reached the Beaufort sea (1789). A journey over the Rocky mountains took him to the Pacific (1792–93).

British interest in the will-o'-the-wisp of the Northwest passage brought Sir John Ross (1818) and Sir William Edward Parry (1820) to the Arctic archipelago and led to the discovery by Ross's nephew, Sir James Ross (1831) of the magnetic pole on the Boothia peninsula, and prompted the overland journeys of Sir John Franklin to the Coppermine river and Coronation gulf (1819–22) and to Great Bear lake and the arctic coast (1825–27). Franklin's ill-starred expedition by sea (1845–48), his disappearance and the loss of his ships, with all his men, occasioned the famous search (1848–59) which incidentally added much to the knowledge of the arctic coast. Meanwhile John Rae, in the service of the Hudson's Bay company, carried on numerous inland journeys (1846–54) and learned much of the Eskimos and of how to live in the north. These explorations had led to the establishment of trading posts by Alexander Mackenzie at Fort Chipewyan on Lake Athabasca (1792), at Edmonton (1795), Fort Resolution on Great Slave lake, Fort Providence on the Mackenzie below, Fort Simpson at the mouth of the Liard, and Fort Good Hope almost on the Arctic circle. The entire area of the territories remained under the jurisdiction of the company till the transfer of 1869, when it became part of Canada, the company retaining only a commercial footing.

The province of Manitoba was created out of the Northwest Territory in 1870, the rest of which, with Rupert's Land, passed under federal control. The North West Mounted Police (later renamed Royal Canadian Mounted Police) was established in 1873. The rapid immigration and land settlement under the Homestead act (1874) necessitated new government. The Northwest Territories Act of 1875 set up a lieutenant governor and council. In 1882 the area below parallel 60° was divided into the provisional districts of Assiniboia, Saskatchewan, Athabasca and Alberta. An act of 1887 gave representation to the territories at Ottawa, and an act of 1888 set up an elected territorial legislature at Regina. The gold discoveries on the Klondike (1896) led to the separation of the Yukon Territory in 1898. In 1905 the situation was entirely changed by the creation of the provinces of Alberta and Saskatchewan. The Boundaries Extension Act of 1912 carried Manitoba to Hudson bay and gave to Ontario and Quebec the rest of the southern and the eastern coast of the bay and what was left of Rupert's Land, thus reducing the territories to their present boundaries.

Government.—The territories are largely under federal control (the department of resources and development), with the seat of government at Ottawa, Ont. The Northwest Territories act (142. R.S.C. 1927) provided for a territorial government composed of the commissioner of the Northwest Territories, the deputy commissioner and five councillors, all appointed by the governor-general in council, but in 1951 this act was amended to provide for three additional elected councillors (total of eight). The commissioner was given power to make ordinances under instructions from the governor-general in council or the minister of resources and development, respecting direct taxation and establishment of territorial offices, prisons, municipal institutions, solemnization of marriage, property and civil rights, administration of justice and in general all local matters. The 1947 redistribution act created a federal electoral division called Yukon-Mackenzie River, and thus after the 1949 election the Mackenzie

river port of the Northwest Territories was represented jointly with the Yukon Territory in the house of commons. Appointment of a superintendent for the eastern arctic and one for the Mackenzie district was provided. An agent stationed at Fort Smith, the point of entry from Alberta, was also given duties as superintendent of the Wood-Buffalo National park, as land and crown timber agent, mining recorder and magistrate and sheriff.

The territories were divided into medical districts with appointed officers in charge at Forts Smith, Simpson, Resolution and Norman, and at Aklavik, Yellowknife, Chesterfield and Pangnirtung. The medical officers act also as coroners and have jurisdiction over hospitals, schools and industrial homes (Chesterfield and Pangnirtung). Public hospitals were opened, under government subsidy, by the Anglican and Roman Catholic missions at Forts Smith, Resolution and Simpson, and at Hay River, Aklavik (both denominations), Rae, Chesterfield and Pangnirtung. An Indian affairs hospital was established at Coppermine.

The Royal Canadian Mounted Police maintain law and order. Detachments stationed at various points in the territories carry out patrols by dogsled, boat, aeroplane, motorcar and on foot. Police are responsible for enforcing the criminal law, customs, game laws and fur-trade regulations. The R.C.M.P. schooner "St. Roch" is used as a floating detachment in the far north and as a supply ship to isolated detachments.

Physical Geography.—Apart from division by latitude and longitude, the territories are physically divided into distinct areas. There is first the broad northeastern stretch formerly called the barren lands or the subarctics, often described as the arctic prairies. This is a treeless country, flat or of low, rolling elevation, of barren slate and rock partly covered with thin soil, over which shallow, rapid rivers, expanding into considerable lakes, run northeast (the Thelon, Dubawnt and Kazan) to the Chesterfield inlet on Hudson bay, or north to form the Back and the Coppermine rivers to the arctic. The arctic prairies are in part covered with vegetation that includes more than 750 species of flowering plants and forms thus a rich grazing ground for caribou and musk oxen. A few stunted willows grow in sunken or sheltered spots. The line of delimitation between the arctic prairies and the line of real forest runs irregularly from Fort Churchill to the Mackenzie delta, the trees advancing northward in favoured places. A midway division, named on official maps the Northern Transition section, in the territories about 100 mi. wide, may be distinguished between the arctic prairies proper and the line of real forest that runs from the eastern end of Lake Athabasca and Great Slave lake to the western end of Great Bear lake. This wooded section covers all the basin of the Mackenzie and its great tributaries, but in the territories is narrower on the west bank where it passes into plains of grass and then changes to the forests of the Rockies. The trees of the Mackenzie basin are chiefly spruce, balsam, white birch, poplar and jack pine.

The Arctic Archipelago.—Among the islands of this archipelago are some of the largest in the world. Baffin Island covers 197,754 sq.mi., and Victoria Island 80,340 sq.mi. Until recently the total white population consisted of about 50 on Baffin Island and perhaps 20 more scattered through adjacent islands. With the advent of air services and the extension of meteorological and radio research this number was considerably increased. A notable event was the Canadian military expedition ("Exercise Musk-ox") early in 1946, in which a group of army men travelled by tractors from Churchill to Cambridge bay on Victoria Island, returning via Coppermine and Norman Wells. Of great interest also were the voyages of the "St. Roch," which twice traversed the Northwest passage. In 1941 and 1942 it made the journey from Cambridge bay to Pond inlet in Baffin Island, wintering near the magnetic pole. In 1944 Sgt. Henry Larsen made the return journey, and traversed the difficult portion of the journey—from Pond inlet to the Beaufort sea—in 18 days. He found the narrow Prince of Wales strait (north of Victoria Island) practically free of ice, and so was able to accomplish this feat of navigation in record time. The "St. Roch" was the only vessel to traverse the historic passage both ways.

Most of the large islands belong to a large geological basin and exhibit the same topography. They are plateaus, built up for the most part of Palaeozoic rocks, though Triassic rocks form the uppermost saucer of the basin in Sverdrup Islands. However, the northern portion of Ellesmere Island has been much affected by past mountain building, and there are rugged peaks, said to be as much as 10,000 ft. high. There are large ice caps on the higher portions of the plateaus in Ellesmere and Baffin Islands. The most northerly post is that at Bache peninsula, about halfway up the east coast of Ellesmere Island.

An expedition in 1947 investigated the site of the north magnetic pole. Survey by the aeroplane "Aries" seemed to show that it had moved north from Boothia peninsula by perhaps as much as 300 mi. About that time the United States co-operated with Canada in establishing weather and loran (long range radar aid to air navigation) stations on various islands of the archipelago, including such locations as Eureka sound, Winter harbour, Cambridge Bay, and on Resolution and Nottingham islands.

Climate.—The line of the Arctic circle (lat. 66° 32′ N) runs through the north mainland of the territories across the upper corner of Great Bear lake, thus leaving the Mackenzie delta (Aklavik, Fort Macpherson) and the centre coastal region in the arctic winter night. The greatest range of temperature in the continent is found in the region to the east of Great Slave lake, where the difference between January and July temperatures amounts to more than 85 degrees. But the outstanding feature of the climate is the warmth of the Mackenzie basin in midsummer. The isotherm of 57° F. in July forms a hot loop which includes the big river and the districts around Great Slave and Athabasca lakes. All this huge region is therefore as warm in midsummer as is most of Newfoundland. This is particularly significant, since this isotherm represents the northern limit of some agriculture, and where the soils are suitable a hay-potato economy may spread down the Mackenzie valley to the circle.

Midwinter shows a January average of −20° F. from the Yukon down to Lake Athabasca (Fort Churchill −25°). The Great Bear lake average is −30°; the coast at the delta about −25°. Lowest average annual figures are −55° to −60°, in the Mackenzie valley. The summer months are June, July and August; in parts of the territories summer temperatures may rise to 90° in the shade and average 70° in the daytime. Great Bear lake in midwinter freezes over with ice 7 to 8 ft. thick but is open for navigation from mid-July till the end of September. Great Slave lake also freezes over completely each winter, the ice having an average thickness of from 2½ to 4 ft., depending on the snowfall during the early part of the winter. The shore waters begin to freeze about the middle of October, and freight trucks and tractors are able to cross the lake early in January. Navigation opens about June 10.

The rainfall is low throughout the territories, with a minimum below 10 in. in Boothia and Melville peninsulas. Along the Mackenzie river the rainfall increases to 11 in., and the Liard basin receives about 14 in. Some of this falls as snow, but as the region is one of summer rainfall the snow cover is never very thick.

Population.—The population of the territories, made up of officials, police, missionaries and transport and company workers, was placed by the census of 1931 at 9,723 and by the census of 1951 at 16,004. The territories experienced a rapid increase of population by the influx into the Yellowknife gold mining district, and into the Great Bear lake uranium area, in the 1939–51 period. The Eskimo population of the territories was estimated at 8,437 in 1950. Various tribes of Athabascan Indians (the main stock of northwest Canada) are grouped along the Mackenzie river systems in the wooded country. All of the Indians of the territories (3,816 in 1944) were placed under treaty arrangements guaranteeing certain rights (annual subsidy, free schools, hunting rights, etc.) and imposing certain disabilities as to liquor, right to vote, etc.

Entirely separate in life and culture, though distantly related by race to the Indians, are the Eskimos. They occupy the arctic coast from the Mackenzie river mouth to Hudson bay along the Baker-Lake Chesterfield inlet. Most of the 8,437 live in the

territories proper, but about 1,600 live on the Ungava coast, on the south shore of Hudson strait, formerly a part of the territories but later joined to Quebec. A few bands of Eskimos in the territories left the coast to live inland, depending on caribou for both food and clothing. Only a handful of Eskimos live on the Yukon coast and on that of Manitoba.

The majority of the Indians and Eskimos are, at least nominally, Christians, the Indians mostly Roman Catholic as the result of early missions, the Eskimos Anglican by British contact by sea. The belief and practices of both are much affected by their earlier spirit doctrines. Roman Catholic missions began with the Abbé Thibault in 1845. The Church of England created a bishopric of the Mackenzie as early as 1884, but the first wintering Anglican missionary in the arctic was the famous I. O. Stringer (Hershel Is. 1892–1902, Bishop of Yukon, 1905).

Resources.—The natural resources of the territories are undoubtedly great but until after World War II were only scantily explored and little exploited. Apart from the seals and salt water fish of the arctic and the Hudson bay, the fish of Great Bear lake (12,000 sq.mi.) and Great Slave lake (11,170 sq.mi.) and apart from the forest and grazing grounds, there is undoubtedly great wealth to develop in oil and minerals. Oil and natural gas had been known to underlie the Mackenzie valley ever since Alexander Mackenzie saw flaming coal seams on his journey of 1789. Prospecting for oil began in 1914 and a strike was made in 1920 near Fort Norman, below the mouth of the Great Bear river. There was a stampede to stake claims, but it was soon found that the heavy cost of transport prevented oil development. The radium discoveries on Great Bear lake and the opening of the Yellowknife gold fields created a market and put the oil wells at Fort Norman into active operation. Production reached a peak of 1,223,675 bbl. for 1944, but by 1949 had fallen off to 155,528 bbl.

During World War II much attention was given to the Norman Wells oil field, and two large settlements were established on the Mackenzie river about 40 mi. N. of Norman. On the east bank and in the small islands in the river many wells were drilled, and in 23 oil was obtained at about 1,500 ft. The field is about 3 mi. wide and 5 mi. long, and the oil was pumped across the 4-mi. wide river to "Canol." There another group of engineers was concerned with pumping the oil through a 4-in. pipe for about 600 mi. to the refinery at Whitehorse, Yukon. During 1944 and 1945 there were daily planes flying from Edmonton to this outlying oil field; but the project was abandoned to a large extent after peace was declared.

A striking feature among the resources of the territories is the radium of Great Bear lake. Silver-pitchblende at the east end of the lake was discovered in 1930, and a milling and mining plant was established. Silver, copper, cobalt and lead, as well as radium and uranium, are recovered from the ores. The radium and uranium products are sent for treatment to a refinery at Port Hope, Ont. Canadian production of radium had cut the price of radium 62% by 1938. Radium and uranium shipped in 1939 were valued at $1,121,553. In 1944 supervision and control of Canadian radium and uranium production was entrusted to Crown-owned Eldorado Mining and Refining limited, and production statistics thereafter became confidential.

Following reports from the Geological survey (1935), active prospecting for gold began on the north side of Great Slave lake. The resulting discoveries opened up rich mines at Yellowknife on the north arm of the lake in 1938 and created a boom town. Production by the four chief mines had a total value of $6,389,748 in 1949.

A stock of 2,370 reindeer was driven in from Alaska in 1935 and established on a reserve near the Mackenzie delta. This main herd had increased to 5,000 head by 1942, and 3,000 other deer were in minor herds near the Anderson and Horton rivers. Surplus reindeer, about 200 head, were slaughtered each year, and about one-half of the carcasses were given to the local mission stations. The Wood-Buffalo park (17,300 sq.mi., and largest in the world), overlapping the provincial border at Fort Smith, was set aside for the protection of buffalo. The Thelon game sanctuary east of Great Slave lake was created to protect all game, especially musk oxen which may not be killed anywhere in the territories. In 1940 an area of about 14,000 sq.mi. around the Mackenzie delta was declared a beaver sanctuary in which all trapping was forbidden.

Land fit for agriculture is very limited and is found only in the immediate Mackenzie basin. Common garden vegetables—potatoes, cabbages, peas, lettuce, etc.—are raised at all posts, the long daylight counteracting the short summer season. The greater part of the Mackenzie valley carries a forest, as described, which supplies both timber and firewood.

Water Power.—The Mackenzie river itself, without rapids, offers no water power. But there is extensive water power in the territories which by 1951 was neither accurately estimated nor much developed. Official statistics of 1949 showed water power (1,000–100,000 h.p. in each location) on the Great Bear river, on the inland feeders of Great Bear lake, in various rapids of the Dubawnt and above all (at least 200,000 h.p.) in the Great Slave river, and even more at the gathering of waters at Clinton Colden and Aylmer lakes. By 1951 power to the extent of 4,200 h.p. was developed on the Yellowknife river and transmitted to the mines; waterpower was supplemented in 1948 by the opening of the federal government controlled hydroelectric project on the Snare river, 94 mi. from Yellowknife.

Communications.—There were no railways in the territories at mid-20th century. Communication was by water, sled and aeroplane. The Mackenzie river, which from its sources in the provinces is in all 2,635 mi. in length—the longest river in Canada—affords an admirable central artery. It offers an unimpeded water course for steamers, motorboats and barges, extending 1,292 mi. from Fort Smith on the Slave river to Aklavik on the arctic. From the refrigerator cars at the railhead waterways (Alberta), refrigerator barges, chemically chilled, carry fresh frozen meats, vegetables and even ice cream into the arctic as far as Great Bear river during the open season, and carry out fish. Communication with Great Bear lake is difficult, since the Great Bear river (75 mi. long) is shallow and swift with abrupt banks and is broken in mid-course by many miles of rapids, around which a portage road for trucks was constructed. The coming of the aeroplane and communication by radio ended the isolation of the arctic.

The department of transport operates meteorological stations at Chesterfield and Coppermine on the mainland, in addition to those on islands of the archipelago. The Alaska highway, constructed as a military measure in 1942 from Dawson Creek, B.C., to Fairbanks, Alsk., cut past the southwest corner of the territories and afforded a new means of access. A winter tractor road following the course of the Hay river connected Grimshaw (Alta.) with Great Slave lake. (S. Lea.; G. Tr.; C. Cy.)

NORTHWEST TERRITORY, the name given by congress in 1787 to that portion of the then United States west of the Allegheny mountains and north of the Ohio river. Previous to 1763 it belonged to France; by the treaty of peace at the close of the Revolutionary War, this vast area of more than 250,000 sq.mi. became part of the United States. Its ownership was claimed by various states, but by 1786 all but the Western Reserve (*see* Ohio), which was retained by Connecticut, was ceded to the federal government. In the ordinance of 1787 passed by congress for the government of the territory, provisions were made which long played a prominent part in U.S. history, espe-

cially that by which slavery was forever prohibited within it. Out of this territory, Indiana, Illinois, Wisconsin, Michigan, Ohio and part of Minnesota were subsequently carved.

NORTHWICH, a market town and urban district of Cheshire, Eng., 171 mi. N.W. of London, on the London Midland Region railway route. Pop. (1951) 17,480. Area, 3.3 sq.mi. It lies at the junction of the Weaver and Dane rivers and is located in Great Britain's most important salt-producing area. In the narrow and irregular streets of Northwich many of the houses have sunk and are at fantastic angles (being strongly bolted to keep them secure) because of subsidences resulting from the pumping of brine. This latter method of salt production has largely replaced the mining of rock salt. The salt is conveyed to the Mersey ports for export, by the Weaver river, which is connected by a hydraulic elevator with the Trent and Mersey canal on higher level.

NORTON, CAROLINE ELIZABETH SARAH (1808–1877), afterward Lady Stirling-Maxwell, English writer, was born in London in 1808. One of the three beautiful granddaughters of Richard Brinsley Sheridan, daughters of his son Thomas, the "three Graces" of London society in the reign of George IV, she began to write before she was out of her teens. Her two sisters Helen and Georgina became respectively Lady Dufferin and duchess of Somerset. At the age of 17, Caroline published a merry satire, *The Dandies' Rout,* illustrated by herself; this was followed by *The Sorrows of Rosalie* (1829) and *The Undying One* (1830), a version of the legend of the Wandering Jew. She married in 1827 the Hon. George Norton, brother of Lord Grantley. The husband's persecutions culminated in 1836 in an action brought against Lord Melbourne for seduction of his wife, which the jury decided against Norton without leaving the box. The case against Lord Melbourne was so weak that it was suggested that Norton was urged to make the accusation by Melbourne's political enemies, in the hope that the scandal would prevent him from being premier when the princess Victoria should succeed William IV. In 1853 legal proceedings between Mrs. Norton and her husband were again entered on, because he not only failed to pay her allowance but demanded the proceeds of her books. Mrs. Norton made her own experience a plea for addressing to the queen in 1855 an eloquent letter on the divorce laws, and her writings did much to ripen opinion for changes in the legal status of married women. George Meredith, in *Diana of the Crossways,* used her as the model for his "Diana." Mrs. Norton was not a mere writer of elegant trifles; her *Voice from the Factories* (1836) was a most eloquent and rousing condemnation of child labour. *The Dream, and other Poems* appeared in 1840. *Aunt Carry's Ballads* (1847), dedicated to her nephews and nieces, are written with charming tenderness and grace. Later in life she produced three novels. She wrote a preface to *The Rose of Jericho,* a translation from a German fable by her mother, Mrs. Sheridan. She died on June 15, 1877. Her husband died in 1875; and Mrs. Norton in the last year of her life married Sir W. Stirling-Maxwell.

See Jane G. Perkins, *The Life of Mrs. Norton* (1909).

NORTON, CHARLES ELIOT (1827–1908), U.S. scholar and man of letters, was born at Cambridge, Mass., on Nov. 16, 1827. The descendant of a long line of clergymen and of Anne Bradstreet, the Puritans' "tenth muse," in his idealism, restraint and dignity he was a member of the New England group already passing into its decline. Yet in him there was, too, an alien strain that made him, after graduation from Harvard in 1846, take employment with an oriental trading firm, for which as supercargo he travelled out to India. The leisurely trip through Europe on his return and his early contact with the culture of an older civilization made him feel sharply what he had been losing in life—"pleasure, opportunities, happiness, indeed, of a sort that nothing else can supply." He felt himself to be "half starved" in the U.S., yet he knew that in the old world he would be "half starved for this strange new one." Thenceforth his work was largely that of torchbearer and interpreter. As lecturer on and first professor of the history of art at Harvard (fom 1874 to 1898 when he became emeritus), he was long considered the "oracle of the humanities." From his first publication of church hymns (1852), he turned to *Notes of Travel and Study in Italy* (1860), and to his later *Historical Studies of Church Building in the Middle Ages* (1880). A translator of *The New Life of Dante Alighieri* as early as 1859, he did what was probably his best literary work in his prose translation of the *Divine Comedy* (1891–92). He helped to develop the creative abilities of his own countrymen in his editorship (1864–68) with James Russell Lowell of the *North American Review.* For long years with unfailing grace and tact he edited the literary remains of many of his friends. *The Correspondence of Thomas Carlyle and Ralph Waldo Emerson* (1883), *Letters of John Ruskin to Charles Eliot Norton* (1904)—records of a rare friendship mutually profitable—the *Orations and Addresses of George William Curtis* (1894), *Henry Wadsworth Longfellow; a Sketch of his Life, together with Longfellow's Chief Biographical Poems* (1907), the *Letters of James Russell Lowell* (1894) all bear testimony to the variety of his friendships in England and the U.S. and to his editorial discrimination. In allusion to this phase of his life, he suggested to Lowell as an inscription over his grave, "He had good friends, whom he loved." Yet his was never too exclusive a disposition. A lover of the beautiful in art, he was also a worker for the beautiful in life. Between 1846 and 1849 when he was still in the countinghouse, he opened a night school for men and boys in Cambridge; he was a director of the movement for model lodginghouses in Boston; he was a zealous worker for the Union cause, especially through his editorial labours for the New England Loyal Publication society. When he died (Oct. 21, 1908) at "Shady Hill," the gracious house in which he had been born, he left the memory of a serene and well-ordered life.

Bibliography.—The best record of his life is afforded by his *Letters,* which were edited with biographical comment by his daughter Sara Norton and M. A. De Wolfe Howe (1913). Tributes to his work and personality may be found in *The Harvard Graduates' Magazine* (vol. 16, Dec. 1907; vol. 17, Dec. 1908) and in T. W. Higginson, *Carlyle's Laugh* (1909).

NORTON, JOHN PITKIN (1822–1852), U.S. agricultural chemist and educator, was born in Albany, N.Y., on July 19, 1822. Norton worked on the farm of his father, John Treadwell Norton, during the summers, and he studied under leading teachers in Boston, Mass., New Haven, Conn., and New York city. He attended Yale university, New Haven, where he studied chemistry, and was a student of James F. W. Johnston at Edinburgh and Gerardus J. Mulder at Utrecht. After Norton was named professor of agricultural chemistry at Yale university in 1846, he played an important part in organizing the department which later became the Sheffield scientific school. His scientific papers include "On the Analysis of the Oat," *Transactions of the Highland Agricultural Society of Scotland* (July 1846), and "The Potato Disease," *American Journal of Science and Arts* (Nov. 1846; July 1847). Norton died at Farmington, Conn., Sept. 5, 1852.

NORTON, THOMAS (1532–1584), English lawyer, politician and writer of verse, was born in London in 1532. He was educated at Cambridge, and early became a secretary to the protector Edward, duke of Somerset. In 1555 he was admitted a student at the Inner Temple, and married Margery Cranmer, the daughter of the archbishop. From his 18th year Norton had begun to compose verse. He contributed sonnets to *Tottel's Miscellany,* and in 1560 he composed, in company with Thomas Sackville, the earliest English tragedy, *Gorboduc,* performed before Queen Elizabeth I in the Inner Temple on Jan. 18, 1561. In 1562 Norton, who had served in an earlier parliament as the representative of Gatton, became member of parliament for Berwick, and entered with great activity into politics, especially religious politics, and was employed on official business in the Channel Islands and at Rome. Toward the end of his life he was a fanatical anti-Catholic. His punishment of the Catholics, as their official censor from 1581 onward, led to his being nicknamed "rackmaster-general." At last he was deprived of his office and thrown into the Tower. Sir Francis Walsingham presently released him, but he died on March 10, 1584.

The *Tragedie of Gorboduc* was first published, very corruptly, in 1565 and, in better form, as *The Tragedie of Feerex and Porrex,* in 1570.

His numerous anti-Catholic pamphlets included those on the

rebellion of Northumberland and the projected marriage of Mary Queen of Scots to the duke of Norfolk. Norton also translated John Calvin's *Institutes* (1561) and Alexander Nowell's *Catechism* (1570).

For *Gorboduc see* SACKVILLE, THOMAS. The best account of Norton, and his place in literary history, is that of Sidney Lee in his *Dictionary of National Biography*. (E. G.)

NORWALK, a city of Fairfield county, Connecticut, U.S., 42 mi. N.E. of New York city, on Long Island sound at the mouth of the Norwalk river. It is on federal highway 1, and on the Merritt parkway, is served by the New York, New Haven and Hartford railroad. Pop. (1950) 49,460; (1940) 39,849; (1930) 36,019 (24% foreign-born white). The city's area of 24.7 sq.mi. embraces districts of very diversified character: the port and manufacturing centres, summer resorts along the sound and residential sections old and new. Churches and colonial houses surround the historic green. There are four parks and a municipal bathing beach. The city has 200 industries manufacturing a variety of products. Valuable oyster fisheries are also found in Norwalk. It is there that steam was first used in the oyster industry and there, too, the first derby hat in the U.S. was made. The site of Norwalk was purchased from the Indians in 1640 by Roger Ludlow and Daniel Patrick. The first settlement was made in 1649 by a small company from Hartford, and the town was incorporated in 1651. The city was formed by its consolidation in 1913 with the city of South Norwalk (chartered 1870). It was from Norwalk that Nathan Hale, disguised as a Dutch school teacher, started on his fatal errand to Long Island in Sept. 1776.

The village was burned by the British under Gov. William Tryon on July 12, 1779, and a chair is preserved in which (the story goes) Tryon sat and watched the flames from Grumman's hill.

NORWALK, a city of northern Ohio, U.S., on federal highways 18 and 20; the county seat of Huron county. It is served by the N.Y. Central and Wheeling and Lake Erie railways and by many truck lines. Population was 9,775 in 1950 and was 8,211 in the census of 1940. Century-old maple trees line most of the streets, and the manufacturing industries include food products, woodworking, rubber and printing plants. Norwalk was settled in 1817 by colonists from Norwalk, Connecticut. It was incorporated as a town in 1829 and chartered as a city in 1881. It lay within the "Fire Lands" grant made in 1792 by the state of Connecticut to the people of eight Connecticut towns, to indemnify them for losses by fire during the British expeditions under Gov. William Tryon in 1779 and Benedict Arnold in 1781.

NORWAY (NORGE), a kingdom of northern Europe, occupying the western and smaller part of the Scandinavian peninsula. Its eastern frontier marches with that of Sweden, except in the extreme north, where Norway abuts on Finland and the Soviet Union. On the north, northwest and west, the boundaries are the Arctic ocean, Norwegian sea (Atlantic ocean) and North sea respectively. The Skagerrak washes it on the south and southeast. The southern extremity of the country is the island of Kråga near Mandal in 57° 57′ N., the northern is the island of Cape Knivskjell (71° 11′ N.), west of the North cape on the island of Mageröy. Of the mainland, the northernmost promontory is Nordkyn, in 71° 8′ N., the southernmost, Lindesnes in 57° 59′ N. The most western island, Steinsöy, lies off the mouth of the Sogne fjord (4° 30′ E.), and the easternmost point is Hornöy (31° 10′ E.) near Vardö. The direct length of Norway (southwest to northeast) is about 1,100 mi. The extreme breadth (about 61° N.) is 267 mi.; the average is about 60 mi., but the Swedish frontier approaches within 5 mi. of a head branch of Ofoten fjord, and the Finland frontier within 22 mi. of Lyngs fjord. The length of the coastline is difficult to estimate; disregarding indentations it is about 1,647 mi., but including the fjords and greater islands it is probably 12,000 mi. The total area is 125,000 sq.mi. Including Spitsbergen (Svalbard) and Bear Island (Björnöya), the state territory of Norway amounts to about 150,000 sq.mi.

The Spitsbergen group of islands, with Bear Island, Kvitöya, King Karl's Land and Hopen, constitute Svalbard (24,294 sq.mi.), lying between lat. 74° and 81° N. and long. 10° and 35° E. Svalbard is part of the kingdom of Norway; administratively it is an independent unit under a governor. There are about 2,000 Norwegians there, mostly coal miners. Small islands under Norwegian dominion are Jan Mayen in the arctic and Bouvet and Peter I in the antarctic. Queen Maud Land, on the antarctic continental coast between 20° W. and 45° E., is also under Norwegian sovereignty.

Physical Features.—The main highland mass of the whole Scandinavian peninsula is a much eroded plateau which, probably because of its forming, in the main, the watershed between the rapid western rivers and the normally longer and slower eastern rivers of Sweden, has received the name of Kjölen (the Keel). Although the plateau as a structural feature may be considered to extend from southwestern Norway to North cape and even beyond into Spitsbergen, its ridgelike character is most marked where it coincides most closely with the Swedish boundary; *i.e.*, north of 63° N. The high plateau consists of early Palaeozoic rocks which represent one of the oldest structural elements in Europe. An Archaean zone stretches along the west coast from Bergen to Hammerfest, interrupted toward the north by overlying patches of Palaeozoic deposits. Gneiss predominates, but other crystalline rocks occur subordinately. The Lofoten Islands consist chiefly of eruptive granite, syenite and gabbro. South of a line drawn from the head of the Hardanger fjord to Lake Mjösa is another great Archaean area.

A line drawn from the Nase to the North cape coincides roughly with a marked change in the character and structure of the Palaeozoic rocks. East of this line even the Cambrian beds are free from overfolding, overthrusting and regional metamorphism. They lie flat upon the Archaean floor, or have been faulted into it in strips, and they are little altered except in the neighbourhood of igneous intrusions. West of the line the rocks have been folded and metamorphosed to such an extent that it is often difficult to distinguish the Palaeozoic rocks from the Archaean. They form in fact a folded mountain chain of ancient date which has subsequently been worn down and then faulted up. No volcanic rocks of recent date are known in Norway. This faulting largely accounts for the almost unique character of the river and coastal topography of Norway. Differential erosion, partly glacial, has caused many of the highland masses to form prominent mountain summits not only on such islands as the Lofoten chain, but on the plateau itself. The average height of Norway is probably about 1,600 ft. and may be compared with approximately 1,000 ft. for Europe as a whole. This high figure for Norway is achieved not so much from the height of individual summits as from the absence of extensive lowlands; southeastern Norway is the lowest part and even this is of a hilly nature. In the area northwest of the Norway-Finland boundary a few peaks reach slightly more than 4,000 ft., but immediately south of the junction of the three countries the general height increases considerably, though the most lofty summits are entirely Norwegian only in the extreme north of this area. (*See* SWEDEN.) Here Jaggevarre (6,053 ft.) lies between Lyngs and Ulls fjords, and Kistefjell (5,361 ft.) provides right-bank water for the Barduelv, which runs westward north of Torneträsk. Sulitjelma (6,279 ft.) lies actually on the frontier. Nearer the coast and centred approximately on the Arctic circle is the great ice field of Svartisen (*see* GLACIERS), through which projects Snetind peak (5,246 ft.). The only important peaks immediately south of this are Okstindene (5,922 ft.) and the rather better known Börgefjell (5,502 ft.). At about lat. 63½° N. is the southern limit—Trondheim fjord—of a remarkable depression which runs for more than 200 mi. southwest to northeast dividing the narrowest part of Norway into almost equal eastern and western strips. Its exit is at Salt fjord (near Bodö) and it is characterized by numerous rivers, some draining north, others south; the depression is of the greatest importance for internal communication, including railway routes. Due east of Trondheim fjord the plateau is lowest and narrowest, again offering a relatively easy communication route already utilized by a railway. Also from this fjord southward is a valley line and a railway route to the upper Glomma valley and down this to Oslo. South of the Trondheim "narrowing" the plateau swings westward, becoming higher, wider and more definitely Nor-

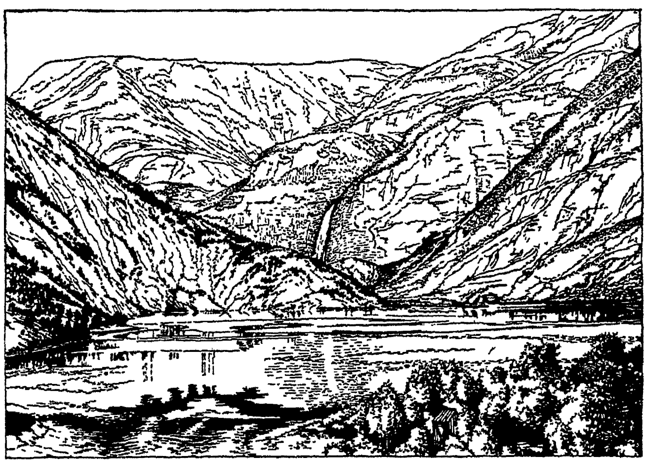
wegian. The Sogne fjord (61° N.) and its branches reach out toward a giant horseshoe of the highest ridges in Norway; northward are the Jostedalsbre; the Jotunheim lies north and northeast; the Hardangervidda is southeast and Vossevangen (Voss) lies south. Northeast of the Jotunheim beyond the deep cleft of Gudbrandsdal and its northwestern counterpart Romsdal, is Dovrefjell, and southeast of this Rondanefjell. South of the Hardangerfjell, beyond Hardanger fjord, is the lake-sprinkled Hardangervidda, the most expansive tract of open high plateau in Europe; southeastward this plateau merges into the lower hummocky Telemark mountains which are drained south and southeast to the Skagerrak. The most lofty summits occur in the Jotunheim with Galdhöpiggen (8,097 ft.) as the highest Norwegian mountain, though if the 100 ft. or so of snow on the top of Glittertind is included, then this reaches to 8,140 ft.; nearly 30 peaks in all exceed 6,500 ft. in the Jotunheim mass. The other mountain areas are lower, though the Dovrefjell and the Rondanefjell have Snöhetta (7,500 ft.) and Rondvaasbu (7,162 ft.) as their respective summit masses.

Glaciers.—The relatively insignificant Norwegian glaciers of today have unimportant effects compared with the glaciation consequent on the presence of the enormous ice fields in the last Ice Age. To these latter glaciers is owed much of the smoothing of islands and the fjord character of the coast. The rounded nakedness of the mountains, the U-shaped valleys, the shelflike ledges over which the rivers plunge to produce the "white coal" of Norway and the pockets of finely divided fertile soils in rock basins are all direct legacies. The level terraces and raised beaches which exist on some of the coasts and prove such desirable sites for settlement are mainly composed of glacial debris once deposited below sea level but now elevated by land oscillation. Today Norway still contains the largest European ice field—the Jostedalsbre. This is about 500 sq.mi. in extent: from it glaciers run to within 150–200 ft. of sea level. Jotunheim, though glaciated, has the icecap broken by deep valleys, also as it lies farther east the precipitation is lower and the summer temperatures higher—two factors seriously affecting the size of icecaps. Between Hardanger fjord and its branch Sör fjord is Folgefonn—110 sq.mi.—and the most southerly considerable area in Norway. Second in point of size to the Jostedalsbre but not inferior in interest is Svartisen—280 sq.mi. in area, from which glaciers descend almost to sea level. In about lat. 70° a small glacier, the Engabre, actually enters the sea in Jokul fjord (a branch of Kvaenangen fjord) and gives birth to miniature icebergs. The Seiland glacier (46 sq.mi.), on the island of the same name south of Hammerfest, is the most northerly Norwegian example. The snow line in Norway varies in height with aspect and amount of precipitation, but it is everywhere fairly low—ranging from below 3,000 ft. in Seiland to slightly above 5,000 ft. in southern Norway.

Coast.—The Norwegian mountains fall abruptly to the sea, and the coastline almost throughout is cliffbound. The land features are continued as numerous islands, estimated at 150,000, which fringe the mainland. This island fringe, occurring also in a modified form along the Swedish coast, is, in Norway, termed the Skjaergård (skerry fence). This fringe and the fjord coast are most fully developed from Stavanger nearly as far as the North cape, but only between Stavanger and Flekkefjord can the coast be considered smooth and moderately free from islands. Here, particularly north of Egersund, a narrow lowland, abundant in peat bogs, is fringed by a flat, open coast, dangerous to shipping. The channels within the island line are of incalculable value to a people largely dependent on coastwise navigation. In fact, the voyage northward from Stavanger may be made in quiet waters almost throughout. Only at rare intervals, as off the port of Haugesund, or when crossing the mouth of some large fjord, need the open sea be encountered. At some points large steamers follow the carefully marked deep water channel, between cliff edges which seem to overhang the vessel on either side. Small vessels, fishing or trading between the fjordside villages, navigate narrow ramifying "leads" (*leder*) where the sole danger is the tidal current, often exceedingly strong. The largest island is Hinnöy (Lofoten and Vesterålen group), about 850 sq.mi. in area.

Many islands, chiefly northern, are of great elevation; thus the jagged granite peaks characteristic of the Lofotens reach about 4,000 ft. Other interesting islands are Hornelen, near the mouth of Nord fjord, rising nearly sheer for 3,000 ft. above the sea; the well-named Torghatten ("the market hat"), north of Namsos, completely pierced, 400 ft. above the sea, by a vast natural tunnel, which on occasion reaches upward of 200 ft. in height and 80 ft. in width; the quaintly shaped small Hestmannöy ("horseman island"), intersected by the Arctic circle, justly named from its form. Bare rock is the dominant feature of the coast and islands, save where a few green fields surrounding a farmstead occupy a miniature level terrace. The oscillation of the land relative to sea level is illustrated by marine terraces, 600 ft. above the present sea level, near Trondheim, and by the numerous former beachlines of north Norway, which are occasionally in pairs at different heights. Nevertheless, at some points (as on the Jaeren coast) glaciated "giants' kettles" may be observed even below the level of high tide thus indicating the greater level of the land toward the close of the glacial epoch.

Fjords.—Oslo fjord, opening from the north angle of the Kattegat and Skagerrak, differs from the great fjords of the west. Its shores are neither high nor precipitous. It is shallower and wider and is surrounded by the most extensive lowland in Norway. It is studded with numerous small islands. Thence, past Lindesnes, to Bokn fjord there are many small fjords, 300 fathoms in extreme depth, but even the intermittent inner lead which can be traced to Flekke fjord ceases to exist beyond. Bokn fjord is broad and island-studded, but throws off several inner arms, of which Lyse fjord, due east of Stavanger, is 25 mi. long and half a mile wide, with precipitous walls. It is the most beautiful and mysterious fjord in southwestern Norway. Hardanger fjord (355 ft. extreme depth) penetrates the land for 105 mi. and is frequently visited, for it lies near to shipping routes which converge on Bergen, but its beauty is exceeded by that of Sogne fjord and Nord fjord farther north. Sogne is the largest and deepest fjord of all; its head is more than 124 mi. from the sea; its maximum width scarcely exceeds 2 mi., and the main channel is 500–660 fathoms deep. Some of the northern arms intersect the snow-clad



THE LISTER FJORD, A NARROW ARM OF WATER CREEPING INLAND TOWARD THE GLACIERS OF THE JOTUNHEIM, IN NORWAY

Jostedalsbre and their dark blue waters have a surface layer showing a milky tinge imparted by glacier-fed streams. Nord fjord (340 ft. in extreme depth) touches the northern side of the Jostedalsbre and is popular with tourists. Stor fjord opens inland from Aalesund; it is more than 70 mi. long and is wild and imposing. Trondheim fjord (300 ft. in extreme depth), the next great fjord northward, broadens inland from a narrow entrance, but lacks grandeur as the elevation of the land is reduced at the Trondheim "narrowing." Immediately north of Trondheim the fjords, though long, are not so extensive and the coastline loses its grandeur, but north of Salt fjord, which lies beyond the great Svartisen ice field, the scenery is unsurpassed. Salt fjord is connected with Skjerstad fjord by three narrow channels where the water, at ebb and flow, forms powerful rapids. The Lofoten Is-

lands and Vesteraalen are separated from the mainland by the Vest fjord (340 ft. deep), which is continued inland by Ofoten fjord, on which is situated Narvik, the railhead town for the line from Sweden.

The main fjords north of Vesterålen have a general northerly direction; among them is Lyngs fjord near Tromsö, with high flanking cliffs. The softer and looser schists are more prevalent in the north, hence the fjords are wider, branched and interlaced, particularly in Finnmark. The Alta fjord (225 ft. extreme depth) is remarkable for the vegetation on its shores. From Lofoten north there is a chain of larger islands: Senja, Kvalöy, Ringvassöy, Söröy, Seiland and Mageröy, thus extending to the most northerly point, but hereafter the Skjaergård ends abruptly. The coast to the east is of widely different character; flat mountain wastes descend precipitously to a sea destitute of islands, save Vardö, with two low islets at the eastern extremity of Norway. The chief fjords are Porsanger and Tana, opening north, and Varanger opening east. North of the last fjord the land is low and the landscape monotonous; on the south of it a few islands and branch fjords break the smoothness of the coastline.

Lakes and Rivers.—Both in respect of rivers and of lakes Norway is well supplied. As a rule, the rivers are short and have a small basin; and the lakes are long, of little area, but of great depth, for many give soundings showing their beds to be well below the present sea level. In this connection, Mjösa, the largest Norwegian lake, 141 sq.mi. in area at an altitude of 397 ft., has a maximum depth of 1,453 ft. (nearly 1,100 ft. below sea level); Tyrifjord (alt. 207 ft., area 51 sq.mi.) has its maximum depth 700 ft. below sea level; Tinnsjö (alt. 605 ft., area 38 sq.mi.) with its bed more than 800 ft. below sea level; but the most remarkable case is Hornindalsvatnet, 6 mi. beyond the head of Nord fjord—20 sq.mi. in area, 180 ft. in altitude; its maximum depth is 1,414 ft. below sea level. Many of the high-level lakes are also of great depth; *e.g.*, Bygdin—area 18 sq.mi., alt. 3,484 ft., greatest depth 705 ft. The total number of lakes, tarns and pools is very high: in all they probably cover nearly 5,000 sq.mi. (4% of the entire country). In many cases the low-lying lake near the head of a fjord is separated from sea water by a narrow but steep-sided neck of land which on further land subsidence would resemble the submerged sill which is so characteristic of the underwater topography of the fjords. The majority of the river-valley lakes resemble mere expansions of the width of the river and possess strong currents; hence they are valuable for internal transport less as routes for water-borne traffic than as providing through lines for land communication in the difficult mountainous sections of the country. Store Le on the frontier in the southeast is somewhat exceptional, for it provides a water-transport link between a Norwegian canal system and a Swedish. The majority of the rivers run swiftly between steeply sloping valley walls, particularly in their upper and middle courses, where they are of little or no value for any form of navigation though they are extremely useful as gigantic flumes for the gravity carriage of timber. They are utilized as waterheads for hydroelectric schemes by which more than 2,000,000 kw. had been developed by 1951.

The unexploited sources were still enormous at mid-century (more than 8,000,000 kw. by the early 1950s). The development of this source of natural wealth is facilitated by the numerous rapids and falls on the rivers. As Norway fully realizes the financial value of its remarkable scenery and of its anglers' haunts, the mode of utilizing this smokeless power in the industrialization of any area is always a matter for careful consideration. A limiting factor in the "white coal" schemes is the seasonal character of many Norwegian streams which run low in winter on the freezing of their upper courses and rise rapidly during the period of maximum rainfall—here the lakes are of supreme value as safety valves controlling spring thaw water and autumnal rain water. Nevertheless, disastrous floods are not unknown. The lakes themselves in the north and interior freeze for varying periods each year, but in the south, where the majority of the large lakes are situated, it is only during very severe winters that these reservoirs become icebound.

The principal river of Norway is the Glomma, about 365 mi. long, which rises about 2,300 ft. above sea level in the highlands south of Trondheim fjord. It is a swift stream with numerous falls, and even within eight miles of its mouth, in Oslo fjord, there is a series of seven falls of which Sarpsfoss (74 ft. high and 120 ft. wide) is the best known. The river, which runs mainly north to south, drains about 16,000 sq mi., pierces the richest timber area and provides an important railway route from Oslo to Trondheim. Above Öyeren (35 sq.mi.), the largest lake of the numerous ones in its course, the Glomma makes a remarkable bend (at Kongsvinger). Here, in postglacial times, the river which formerly ran due south to Vänern lake (Sweden) make a sudden swing to the west capturing the upper waters of the Lågen, formerly an independent stream. (The old bed still carries occasional floodwater from Glomma to the lake.) The Lågen, more than 200 mi. long, has, for a Norwegian river, a large upper basin receiving water from the Jotunheim and the Dovrefjell. Its sources lie near Romsdals fjord, and a direct railway runs from Oslo along its lower course (Vormen river), past the shores of Lake Mjösa, up the Gudbrandsdal, over the watershed and down through Romsdal (another railway line links Trondheim with the head of Gudbrandsdal). Other important streams entering Oslo fjord are the Tistedalselv and the Drammenselv. The Tistedalselv reaches the eastern seaboard after draining through a series of long, narrow lakes connected by rapids. The Drammenselv, a large river with a considerable basin extending into Hemsdalsfjell, Valdres and Filefjell, enters on the western seaboard. Its upper tributaries, the Randselv and the Ådalselv (plunging over Hönefoss), unite to form the Storelv which expands into the Tyrifjord lake. Below this the real Drammenselv begins and receives, on the right bank, the Hallingsdalelv which flows through Lake Kröderen—all these valleyways afford important but not easy routes, and though the rivers are not navigable for any long stretches yet steamers are employed on the lakes. Numerous streams drain southward from the plateau and lake district of Hardangervidda, one of these, the Lågen is noted for its falls (*e.g.*, Hammerfoss and Labrofoss), and for its wealth in salmon. From the Telemark district runs the Skienelv (152 mi.) flowing through the very deep Tinnsjö and the slightly larger, deep Norsjö; the former lake receives the river Måne, on which is the famous Rjukanfoss (460 ft. high). The most notable falls occur in the courses of the shorter and more rapid western streams. Some of the most striking, in order from the south, are: Vöringfoss (597 ft.) on the Bjoreia and Skjeggedalsfoss (525) on the Tysso—these two are in the Hardanger fjord area. Around Sogne fjord are several, of which Vettisfoss (853 ft.) on the Mörkedola is probably the most interesting. The famous Seven Sisters falls are in a branch of the Stor fjord, while the Namsenelv (116 mi.), a popular salmon river entering Namsen fjord, has Fiskumfoss (138 ft.) and several others. The Arctic ocean rivers have gentle gradients, occasional rapids but no important waterfalls. Two longer ones are the Altaelv (124 mi.), which drains into the Alta fjord, though unfortunately its valley affords no route of importance; and the Tanaelv (205 mi. long—third longest river in Norway), which drains a considerable area in Norway and Finland, though the absence of lakes results in summer floods increased by the presence of ice dams. The lower river is wide (about 2,000 yd.) and tidal for six or seven miles and is ascended by small vessels. River boats are used along certain river stretches below and above the Storfoss rapids which occur about 45 mi. from the mouth of the river and have a fall that averages 23 ft. in 1,000 yd.

Climate.—The striking and unique feature of the climate of Norway is the presence of the largest positive temperature anomaly on the surface of the globe, which results in such unusual conditions as average temperatures within the Arctic circle which are higher than those of places farther east and 20° of latitude farther south. Again, Hammerfest, a thriving settlement of more than 3,000 inhabitants, is actually north of King William Land, which witnessed the tragedy of the Sir John Franklin polar exploration party. This temperature anomaly is consequent on the warm water and air drift across the Atlantic ocean onto the shores of Norway. January is the coldest month, and southeastern Norway then has a mean temperature of below 32° F. (Oslo 24.6°), but

the coldest parts in this area are the Glomma valley, between Tynset and Röros (near the Swedish border). At the latter place (altitude 2,067 ft.) the January mean is 13.1° and an absolute minimum of approximately 90° F. of frost has been recorded. Even this intense cold has been exceeded at stations near the Norway-Sweden boundary in Lapland. Along the coast of western and northern Norway winter temperatures are higher, the January mean being 35° in Bergen, 30° in Bodö and 23° in Vardö.

In these coastal districts February is on the average rather colder than January. The number of days on which frost occurs varies between 45 at Ona and 240 in certain parts of Finnmark; North cape has about 190. The fjords are not penetrated by the cold water from the open ocean and are always ice-free except for patches along shallow coastal stretches during unusually severe winters. Summer temperatures range between slightly below 50° in the extreme north (Tromsö 52.5° F. July average), and 62.5° at Oslo in July. Röros, with much greater altitude, has 52.5° average in the same month. The southeast of Norway is the warmest part in summer. At Bergen the warmest month is also July (57.5° average). Absolute maxima are high, and the following have been recorded: Skudenes, 84°; Bergen 86°; Oslo 94.4°; and even Karasjok, in Lapland, has recorded 88°. The annual range increases from west to east generally and from south to north along the coast.

Though the southwest wind is usually prevalent over Norway and very marked in summer, yet the winter high-pressure area causes outflowing winds—northeast on the Skagerrak, south and southeast on the western coast and southwest on the northern. Gales are frequent on the western coast, averaging three to four per month in winter and about one to two per month in summer. In the interior and east, gales are comparatively rare. Gales from the southwest bringing rain are the most common; next in frequency are gales from the northwest bringing snow. Calm weather is rare on the western coast but frequent in the interior. December and January are the stormiest months. Hailstones and thunderstorms are not of frequent occurrence in any part of Norway.

The number of days on which rain or snow falls is greatest on the northwestern and northern coasts, least in the southeastern districts and the interior of Finnmark. In the former area, precipitation occurs on 150–200 days in the year. On Dovrefjell and the southeastern coast the average is about 100 days. Snowfall occurs least frequently in the south (*e.g.*, at Mandal, 25 snowy days out of 116 on which precipitation occurs), increasing to 50 at Oslo and Dovrefjell, to 90 at Vardö and to 100 at the North cape. Hence in the north and in the upland tracts snow occurs at least as frequently as rain. Snow may fall in any month on the coast as far south as the Lofotens. The amount of precipitation exceeds 100 in. per annum in the mountains a few miles from the coast north and south of Sogne fjord. On the outer islands there is a slight decrease; inland the decrease is rapid and great. In the extreme south of the country the average is about 39 in. There is a diminution eastward along the northern coast and a further rapid decrease toward the northern interior, where the average is 16 in., but strongly marked local variations are observed.

The amount of cloudiness is great. The coast of Finnmark has more than three cloudy days to one clear day; in the interior of the country clear and cloudy days are about equally divided. Summer fog is frequent on all coasts but fog is rare in winter, though occasionally experienced in the southeast. Sometimes, in severe winters, a frosty fog ("smoke frost") appears on the western fjords, caused by the piercingly cold land wind passing over the relatively warm water.

Norway was one of the first countries to establish a meteorological service, the Meteorological institute in Oslo being set up in 1866. There are meteorological observatories at Bergen, on Jan Mayen Island and on Bear Island, in East Greenland and on the mountain peaks of Fanaråken and Gausta. There are also 550 stations where meteorological observations and measurements are taken. Weather forecasts nine times a day are made regionally by the institutes at Oslo, Bergen and Tromsö.

The Midnight Sun.—Part, at least, of the sun's disk is above the horizon at the North cape continuously from May 13 to July 31 and at Bodö, in lat. 67° 17′ N., from June 1 to July 13. Even at Trondheim there is practically no night from May 23 to July 20, while the long twilight gives the extreme south of Norway no real darkness from the end of April to the middle of August. In winter, on the other hand, the sun does not rise above the horizon at the North cape for more than two months and there is only a twilight at midday. In the extreme south midwinter night is 17½ hours long.

Flora and Fauna.—The forests of Norway consist chiefly of conifers. The principal forest regions are in the southeast and south. In the Trondheim area and in Nordland there are extensive forests of pine and spruce with the pine on the drier, higher and less congenial parts. In southeastern Norway the conifer tracts extend from sea level to 2,500 to 3,000 ft.; in the inland parts of the Trondheim region the upper limit sinks to 2,000 ft.; while on the coast the upper limit is only from 600 to 1,200 ft.; farther north the spruce disappears and the pine limit falls to 700 ft. about 70° N. Above and north of the conifers is the birch belt; next follow various species of willows and the dwarf birch and last of all, before the snow line, the lichen belt, in which the reindeer moss is always conspicuous but a few flowering plants, shrubs and trees of the willow belt sometimes extend close up to the snow line. Even among the conifers there is a sprinkling of other trees —lowland birches, aspens and rowans in the high north, while in the southern and less elevated districts the lowest zone of forests includes the ash, elm, lime, oak, beech and black alder; but the beech is much rarer than in Sweden and, in fact, flourishes only near the Skagerrak; there and elsewhere the extreme coastal region is destitute of forest. The richest flora is found in the inland fjord valleys, but the Dovrefjell is the district in which arctic flora may be studied in great variety and within narrow limits. Marine flora is very finely developed on the coastal banks. There are 2,000 varieties of flowering plants.

The great forests were once the haunt of the bear, the lynx and the wolf. The bear and the lynx are now almost exterminated. The wolves decreased very suddenly in southern Norway about the middle of the 19th century, probably because of disease, and continued to decrease thereafter in the north; but they are still found in the Röros district and northward to Finnmark where they are abundant. Wolves are the worst enemy of the reindeer. The elk occurs in the eastern forests and near the coast in the Trondheim district, but is now becoming rare. The red deer is confined chiefly to the western coast; its principal haunt is the island of Hitra, off the Trondheim fjord. It is usually regarded as a survival of the oak age. On the high fjells are found the wild reindeer, glutton, lemming and the fox. The wild reindeer is now very rare in Finnmark, though large tame herds are kept by the Lapps. The lemming is noted for its curious nonperiodic migrations; at such times vast numbers of these small animals spread down country, even swimming lakes and fjords. They are pursued by beasts and birds of prey, and even the reindeer kill them for the sake of the vegetable matter they contain. Hares are very common all over Norway up to the snow line, and the badger and hedgehog also occur in the south and southeast. The beaver, formerly widespread, decreased seriously, but strict protection has saved it and it is fairly plentiful in the southern valleys.

Game birds are fairly abundant in most districts. Black grouse are widely distributed in the region of conifers and birches south of Finnmark. Hazel grouse are found mainly in the spruce forests

of the southeast and east and fairly generally in the north, as are capercaillie, but the former is lacking in the west and the latter is found near certain fjords only. Woodcock and snipe are moderately plentiful. The partridge, an immigrant from Sweden, occurs principally in the east and southeast. A severe winter causes a marked scarcity of them. A very large proportion of the Norwegian avifauna consists of migratory geese and ducks, various birds of prey, golden plover, etc. These birds leave in autumn by three well-defined routes—one from Finnmark into Finland, one by the Oslo valley and one by the western coast, where they congregate in large numbers on the lowlands immediately south of Stavanger—but certain high arctic birds as the king eider, Spitsbergen guillemot and the little auk move on to the northern coast of Norway from higher latitudes at the end of summer. The arctic type of bunting, the snowy owl and the rough-legged buzzard are exceedingly numerous. In some localities the puffin and kittiwake form great colonies (*fugleberg,* "bird cliffs").

The common seal is very frequent; and arctic seals visit the northern coasts; among these the harp, or Greenland, seal is believed to be particularly destructive to the fisheries. A large number of the best European food fisheries occur along the coasts, including cod, herring, mackerel, sprat and flatfish. Various species of whales visit the coast; the most important is the rorqual, or finner; the largest is the blue whale, which appears off the coast of Finnmark from June to August. Other finners are the true finner and the smaller fish whale. The most important of other types of whales are the bottlenose, the humpback and the caaing whale. Of fresh-water fish the Salmonidae are by far the most valuable. Next to these, perch, pike, grayling and minnow are most common.

Southern Norway is richer than western Norway in insects and the north has numerous characteristic arctic types.

Norway is much frequented by British anglers. The Salmonidae have penetrated considerable distances inland, and though the trout is the only one to reach many of the upland lakes yet it is very abundant there. Most of the owners of water rights have a full appreciation of the value of good fishing to sportsmen, especially when netting rights are given up for the sake of rod-fishing.

(O. J. R. H; X.)

HISTORY

Prehistory.—Norway can be shown to have been inhabited for about 14,000 years, since the withdrawal of glaciation to the central highlands of the country. The primitive dwelling sites represent a culture derived from the palaeolithic cultures of western and central Europe and introduced from the southwest via Jutland, from Poland via the Baltic and from Russia via the White sea. Further cultural elements were added with every new accession of population, the different groups probably representing more or less different races which, however, have left neither skeletal remains nor traces of their language or languages.

NORWEGIAN HORSEMEN IN THE BRONZE AGE. FROM A ROCK CARVING IN BAAHUSLEN, FORMERLY SOUTHERN NORWAY

Among these primitive hunters there gradually appeared distinct settlements of farming colonists from Denmark and Sweden; and by about the beginning of the Christian era the native hunters had come to adopt these farmers' way of life, language and religion and had in turn enriched the farmers' culture with their own experience in fishing, fowling and hunting. The two peoples were now completely assimilated.

All the ancient place names in Norway are of Germanic origin, and the first runic inscriptions, from the 3rd century A.D., show an archaic type of Germanic that was certainly the mother language of the later Scandinavian dialects.

Earliest History.—Before the consolidation of the kingdom the principal parts of Norway were markedly distinct. Viken, the country around Oslo fjord, was dependent on Denmark, under local kings. The inland regions were divided into several small kingdoms, open to influences from Sweden and united by the common Eidsiva-thing at Eidsvoll. The coast in the south and the west clearly enjoyed cultural relations with Flanders and France and formed from *c.* A.D. 700 an aristocratic confederation, with the common Gula-thing on Sogne fjord. The eight counties (*fylker*) round the Trondheim fjord had their primary political centre in the Oere-thing at Trondheim, where later kings of Norway, from the time of Haakon the Good, received the homage of the people. The northernmost province, Hálogaland, was a monarchy ruled by an ancient dynasty, later to be called the jarls of Lade.

The first exact date in Norse history is 813, given by a Frankish annalist with the information that Vestfold, on the Oslo fjord, was subject to the king in Jutland. The first Norse Vikings to come to Great Britain are described in the Anglo-Saxon chronicle, under the year 787, as "norðmanna of Hareðalande"; viz., Hordaland in Norway. Graves and place names attest Norse settlements in the Scottish isles from *c.* 800, and Dublin was fortified in 839.

The Dynasty of Harald Haarfager.—While the nobles of southern and western Norway were engaged in Scotland and Ireland Harald Haarfager (Fairhair), ruler of several scattered territories, took the opportunity to conquer the whole confederation of Gula-thing by the victory in Hafrsfjord (872; sometimes dated 20 years later). Apparently he acted in alliance with the jarl of Lade, who had annexed Tröndelag to his possessions. After the conquest Harald resided in estates confiscated from exiled nobles, and parts of Viken were assigned to his sons. The purpose of the conquest was simply to acquire larger means of subsistence, to increase the king's retinue of warriors and to maintain his sons.

Harald Haarfager, as Harald I, was undisputed king of all Norway. He had designated as his successor Eric I Bloody Axe (Eirik Blodóks, *c.* 930–*c.* 935), his son by his Danish queen, who was moreover married to the sister of the king of Denmark. Chosen as most highborn, perhaps because of reminiscences of Vestfold's vassalage to Denmark, Eric started his reign by killing two of his eight brothers and within a few years had got rid of all but one, the youngest, Haakon (Hákon), who was reared at the court of the English king Aethelstan. Later tradition reports that Eric reigned for five years and then left the country, on Haakon's arrival from England. He was killed at Stanmoor, Cumberland, in 954.

Sigurd, jarl of Lade, had summoned young Haakon and now had him received as king in several parts of the country. The considerable concessions that he had to make to claims for local independence won him his surname of "the Good." Haakon I was the first missionary king of Norway, but he totally failed to convert his people. The saga assigns to him the credit of organizing the naval levy all along the coast, the first important step toward the political consolidation of the kingdom. At the time this force, or *leidang,* was required against Eric's sons, who, assisted by Danish forces, made repeated attacks to regain the kingdom. The levy proved efficient, but Haakon was mortally wounded in the battle at Fitjar (*c.* 960; possibly as early as 945).

The next king was Harald II Graafell (Grey Fur), the eldest surviving son of Eric. He resumed his father's efforts to assert himself as lord of the whole country and killed two petty kings (his father's cousins) in Viken and Sigurd, jarl of Lade. Reputed a hard oppressor of the people, he became the more unpopular because he prohibited the public worship of the gods—no surprise

was felt when the harvest was bad and fisheries failed. The reign was not likely to last long: one of his brothers was killed during a revolt in Tröndelag, another in Hordaland, and Harald himself in a battle (*c.* 970) against Haakon, son of Sigurd of Lade.

This Haakon now succeeded as jarl of Lade and took over the Gula-thing counties as a fief of Denmark, while Denmark annexed all eastern Norway. Haakon Jarl assisted his Danish lord in a war against the emperor Otto II in 974 but refused to convey Christian missionaries into Norway. A contemporary scald praises him as the pious champion of the ancestral faith, the restorer of temples and worship. He repulsed Danish attacks with his *leidang* and remained for about 25 years the sovereign of western and northern Norway, like Haakon the Good, though he preferred his ancestral title of jarl. He was killed in 995 at a peasant riot in Tröndelag, coincidentally with the arrival of a fresh royal pretender from England.

Olaf I Tryggvessön was a descendant of Harald Haarfager. Bred from boyhood in Russia, he had become a Viking chieftain and had been the leader of the invasion of England in 991. On the conclusion of peace, he had been confirmed a Christian by the bishop of Winchester and adopted by Aethelred II, who probably incited him to convert Norway. He landed in 995, was recognized as king all along the coast and ensured acceptance of Christianity everywhere, partly by negotiation, otherwise by cruel force. He extended the mission even to Iceland and Greenland. As he encroached upon the Danish dominion in Norway he provoked a war and was slain in the battle of Swold (1000). Norway remained divided between the jarl of Lade and the king of Denmark.

Olaf II Haraldsson, another descendant of Harald Haarfager, had been a Viking from his boyhood till his landing in Norway in 1015, at the favourable moment when Eric jarl of Lade had gone with Canute of Denmark on his expedition to England. Olaf was the first king who really ruled all Norway, including the inland counties. He organized a regular royal administration by *lendmenn* (selected from the old aristocracy as military and judicial officials) and *armenn* (mean-born servants of the king who managed his estates). He completed the christianization and started the organization of the church. But he was not popular, being too severe in maintaining his royal power.

Olaf was let undisturbed as long as Canute was seriously engaged in England but was expelled when Canute had further leisure to invade Norway (1028). After two years he returned and was killed in the battle at Stiklestad (1030). Canute made his son Sweyn (Svein; 1028–35) king of Norway. But soon rumours were spreading that Olaf was a saint: his body was enshrined in the cathedral, Sweyn was exiled, and Olaf's son Magnus I was called back as king (1035–47). Magnus became king also of Denmark in 1042 and crushed a Slav invasion of Jutland by the victory at Lyrskog. He came to be known as Magnus the Good. But soon Sweyn II Estrithson, nephew of Canute, revolted against him, and Magnus died during a campaign in Denmark, the last descendant of Harald Haarfager.

The Dynasty of Harald III Hardraade.—Harald Sigurdsson, uterine brother of Olaf II, who had escaped from Stiklestad and taken service in the imperial bodyguard in Constantinople, had in 1046 returned to Norway, where Magnus complied with his demand to share the kingdom as Harald III. For several years he continued the war for Denmark, but finally had to leave it in Sweyn Estrithson's possession. In Norway his reign caused much unrest and gave rise to his epithet Hardraade (harðráðr), "the hard ruler." He was killed at Stamford bridge on his expedition to England in 1066.

Harald III's son Olaf III Kyrre (*i.e.*, the Quiet; 1066–93), who shared the kingdom with his brother Magnus II till the latter's death in 1069, made formal peace with Denmark and was never involved in war. He gave the dioceses fixed territories and permanent seats, which led to the rise of the first Norse towns and to the development of trade. Olaf's son Magnus III Barfot (Barefoot; 1093–1103) formed a striking contrast to the father, engaging in three expeditions to Scotland to establish Norse sovereignty over the Orkneys and the Hebrides (with Man). He got his epithet because he assumed the Celtic dress, with a kilt. He met his death in Ireland and was succeeded by his sons Olaf IV (1103–15), Eystein I (1103–22) and Sigurd I Jorsalafar (1103–30; so-called because of his visit to Jerusalem). These kings reigned jointly, paying special attention to the church. They imposed the tithes to better the clergy's income, founded the first Norse monasteries and built cathedrals. The clergy of the Scottish isles was incorporated into the church of Norway.

The unity of the kingdom had been made sacred by Olaf II's martyrdom, but all royal princes still had equal right to the succession. Thus Harald IV Gylle, Gille or Gilchrist, from Ireland, who after submitting to ordeal by fire had been acknowledged by Sigurd Jorsalafar as a bastard son of Magnus III Barfot, was able when Sigurd was dead to capture and blind the legitimate prince Magnus IV and to reign for a year till he was himself killed (1136) by a fresh pretender, who likewise failed and was executed. Similar tragedies recurred for the next 100 years, causing continual wars between rival parties of *lendmenn* and provinces. The troubles reduced the royal authority but invigorated the church by giving rise to the institution of the Norse archbishopric (1151) and of the right of testamentary donations, Peter's pence, etc., and, particularly, to the privileges granted to it in order to obtain the coronation (1163) of Magnus V Erlingsson, which made the king, now St. Olaf's vassal, recognize the tithe dues and also the independence of clerical jurisdiction.

Magnus V was long successful till (1177) he met his last antagonist, Sverre, born in the Faeroes, who claimed to be a grandson of Harald Gilchrist. After bitter fighting for several years Sverre in 1184 was recognized king of all Norway, though there were rebellions even up to his death 1202. Sverre radically reformed the administration. He established the *hird,* comprising both court officials and men resident on their estates, as a new aristocracy and reserved for its members the career of sysselmenn in local administration, in the place of the *lendmenn.* Of equal importance was the institution of *lagmenn* ("lawmen") as instructors of the juries, the first step toward creating royal judges.

The troubles lasted till 1217, when Sverre's grandson Haakon IV Haakonsson, aged 13, became king with Duke Skule as regent. They suppressed the last rebellion in 1227, after which Haakon reigned in peace for 36 years. Haakon made Norway a model state: the administration was modernized by creating the chancellor's office and the royal council; trade flourished, and blood feuds were prohibited. The northern frontier was regulated by a treaty with the Russians, and constant diplomatic relations were maintained with foreign courts, most of all with England. Iceland and Greenland voluntarily agreed to the union with Norway; but Haakon's expedition to Scotland failed to vindicate Norse suzerainty over the Hebrides, and he died at Kirkwall in 1263. His son Magnus VI Lagaboeter (Law-Mender; 1263–80), who ceded the Hebrides to Scotland in 1266, is renowned for his code of national laws, besides special laws for the towns and the *hird.* His efforts to reach a compromise with the church led to bitter controversies during the minority of his son Eric II (1280–99). In conflict with Lübeck, Eric had to give way when a blockade was imposed, but a long war with Denmark ended to his advantage. His brother and successor Haakon V (1299–1319) was a vigorous personality who dispossessed the aristocracy of influence and noble titles, surrounding himself with new men. He replaced the ancient naval levy by regular taxes, professional mercenaries and frontier castles. He made energetic efforts to restrain Hanseatic penetration into Norwegian cities. At his death the national male line of the royal family became extinct.

The Union of Kalmar, 1397.—Haakon V was succeeded in 1319 by the three-year-old Magnus VII, the son of his daughter Ingeborg and Duke Eric, son of Magnus I of Sweden. At the same time the boy was elected king of Sweden in the place of the exiled Birger, last king of the Folkunge dynasty. But this union of Norway and Sweden was personal, not political. The two countries were governed each by its separate regency: a conference in Oslo concluded nothing more than an alliance. The Norse regency was especially watchful to prevent the king's mother from intermingling the affairs of the two kingdoms. King Magnus' Swedish policy, after his coming of age, provoked rebellions in Norway;

and Magnus was forced to recognize his infant younger son Haakon as king of Norway in 1343 and to surrender the kingdom to him when he in turn came of age in 1355. Meanwhile the Black Death (*Svartedauen;* 1349–50) decimated the population, most of all the clergy, and caused lasting political disorganization.

Haakon VI (1355–80) however married Margaret, daughter of Valdemar IV of Denmark, the last of the royal line descended from Sweyn Estrithson and Canute. Their son Olaf V, who had been elected king of Denmark in 1375, succeeded to Norway in 1381 but died, at the age of 17, in 1387. Then his mother Margaret was elected "the mighty lady and the right sovereign" of the three Scandinavian kingdoms, a position unique in the whole history of those countries. But she soon found it more convenient to conform to national traditions by presenting her great-nephew Eric of Pomerania as candidate for the three crowns. In Norway he was acknowledged heir to the kingdom at Oere-thing in 1389, and he was crowned at a general Scandinavian meeting in Kalmar in 1397, where Margaret opened the discussion of her plan for a political union of the three countries. A committee of spiritual and temporal lords drafted a treaty of union which, however, was apparently never ratified, as the draft was not sealed by the Norse lords present.

Margaret remained the regent of the three kingdoms till her death in 1412.

The following list of sovereigns of Norway from the 9th to the 15th century may be found useful (dates before A.D. 1000 are approximate):

Harald Haarfager	c. 870–c. 930	Inge I Krokrygg	1136–61
Eric I Blodöks	c. 930–c. 935	Sigurd II Munn	1136–55
Haakon I	c. 935–c. 960	Eystein II Haraldsson	1142–57
Harald II Graafell	c. 960–c. 970	Haakon II Herdebreid	1161–62
Haakon Jarl	c. 970–c. 995	Magnus V Erlingsson	1162–84
Olaf I Tryggvessön	c. 995–1000	Sverre Sigurdsson	1184–1202
Eric Jarl	1000–15	Haakon III Sverresson	1202–04
Olaf II Haraldsson	1015–28.	Gutorm Sigurdsson	1204
Sweyn Knutsson	1028–35	Inge II Baardsson	1204–17
Magnus I the Good	1035–47	Haakon IV Haakonsson	1217–63
Harald III Hardraade	1046–66	Magnus VI Lagaboeter	1263–80
Olaf III Kyrre	1066–93	Eric II Magnusson	1280–99
Magnus II Haraldsson	1066–69	Haakon V Magnusson	1299–1319
Magnus III Barfot	1093–1103	Magnus VII Ericsson	1319–55
Eystein I Magnusson	1103–22	Haakon VI Magnusson	1355–80
Sigurd I Jorsalafar	1103–30	Olaf V Haakonsson	1381–87
Olaf IV Magnusson	1103–15	Margaret	1387–89
Magnus IV the Blind	1130–35	Eric III (of Pomerania)	1389–1440
Harald IV Gille	1130–36

Danish Rule.—Eric of Pomerania continued Margaret's unitary policy, with the consequence that, since support for the crown came primarily from Denmark, lands, offices and sees throughout Scandinavia were generally assigned to Danes. National resentment at this led to Engelbrekt Engelbrektsson's rebellion in Sweden, which was followed by a Norwegian rising in the Oslo district under Amund Sigurdsson in 1436. But the Danish nobility itself then turned against Eric, who was deposed in 1439, and Norway came to accept his nephew and successor Christopher of Bavaria (Christopher III of Denmark) as king in 1442. Henceforth till 1814 the Danish kings ruled Norway: her fleet and army decayed, and her language gradually gave place to Danish; Germans plundered her coasts and monopolized her commerce, and after 1450 Danes began to appropriate the higher posts in her administration. When in 1448 Karl Knutsson was chosen king by the Swedes and Christian of Oldenburg by the Danes, it was by force that Norway fell to the latter. The Norwegians protested, but the next year the Swedes assented to a separation. Christian I (1450–81) gave estates and offices in Norway to his Danish subjects and pawned her ancient possessions, the Orkneys and Shetland Islands, to the king of Scotland as security for a dowry which remained unpaid. His son Hans (1481–1513; jointly recognized by Denmark and Norway in 1483) purchased the obedience of the Norwegian nobles by concessions to their power. The imposing union continued in name, but the weakness of the nation and its government was strikingly illustrated when the Germans in Bergen besieged a monastery in which a high official had taken refuge.

After the downfall of Hans's son Christian II (1513–23) the position of Norway was changed for the worse. She was ruled for a century and a quarter by Danish officials; her churches and monasteries were sacked by Danes, and Danes were installed as pastors after the Reformation, which the Norwegians were compelled to accept in 1539. Soon Norway was dragged by Denmark into the so-called Seven Years' War of the North (1563–70). However, the power of the Hanseatic league in Bergen was broken. The rule of the Oldenburg dynasty proved neglectful rather than tyrannical, and under it the mass of the peasants was not flagrantly oppressed. Christian IV (1588–1648), who founded Christiania (Oslo), may almost be said to have discovered Norway anew. He reformed its government and strove to develop its resources, but his policy involved the loss of Jemtland and Herjedalen, which were ceded to the Swedes by the peace of Brömsebro (1645). The Danish war of revenge against Charles X of Sweden resulted in further loss by Norway. By the peace of Roskilde (1658) she was compelled to renounce Trondheim and Baahus, and although the former was restored by the peace of Copenhagen (1660) her population fell below 500,000. From the middle of the 17th century, however, the Dutch and English made their influence felt, and the political status of Norway could no longer be regarded as a purely Scandinavian affair. The establishment of hereditary autocracy in Denmark by Frederick III in 1660 conferred many benefits upon Norway. The Norwegian peasant remained a freeman while his counterpart in Denmark was a serf. Norwegian law was revised and codified under Christian V (1670–99), who was well served by the Norwegians in his attempt to regain the lost provinces from Charles XI.

Under the sons of these monarchs, Frederick IV and Charles XII, Norway was once more compelled to pay for Danish aggression. Her shipping was destroyed and in 1716, when driven from continental Europe, Charles XII fell upon her. Only his death, in 1718, averted the danger. During this war Peder Wessel, the greatest among a long series of Norwegian heroes who served in the Danish fleet, won undying fame: in 1716 he was ennobled under the name of Tordenskjold (*q.v.*), by which he is best known. Before the close of the 18th century increasing prosperity developed the national consciousness of Norway. The growth of the timber trade with England gave rise to a great increase in wealth and population. In a century and a half the number of the Norwegian people was doubled, so that by 1814 the population was 900,000. In 1788 the oppressive law that grain should be imported into Norway only from Denmark was repealed. Thanks moreover to Danish policy, Norway actually drew financial profit from the wars of the French Revolution.

In 1770, freedom of the press was introduced by the reforming zeal of Christian VII's German doctor J. F. Struensee, who exercised at this time a more real power in Denmark-Norway than did his insane master. The national aspirations of Norway were then at once voiced, though at first they went little further than the demand for a Norwegian university, which was to be conceded by Frederick VI in 1811. The crisis destined to break the union did not develop until 1807, when George Canning's coup against the Danish fleet drove Christian VII to abandon neutrality and to embrace the cause of Napoleon. Norway, whose interests and sympathies were closely linked with Great Britain, suffered great and immediate damage from a British blockade and was more or less cut off from Denmark, so that a separate administrative commission had to be set up. In 1809 the head of this commission, Prince Christian Augustus of Augustenburg, was elected by the Swedes

as heir to Charles XIII of Sweden in pursuance of a plot, originated by the Norwegian national leader, Herman Count Wedel-Jarlsberg, to transfer the allegiance of Norway to that country. Christian Augustus, however, relinquished his connection with Norway immediately after his election, and the scheme was finally frustrated by his death in May 1810, whereupon the choice of Sweden fell upon Napoleon's marshal Jean Bernadotte, in the hope that so distinguished a solider might recover Finland (taken by Russia in 1808). But Bernadotte was too wise to attempt this and planned to annex Norway instead. With this object he forced Frederick VI, by the treaty of Kiel (Jan. 14, 1814), to renounce his sovereignty over Norway in favour of the king of Sweden. In return for support against his former master Napoleon, the allied great powers had given their support to Bernadotte's policy.

Union with Sweden.—The treaty of Kiel was, however, immediately repudiated by the Norwegians, who contended that it violated the principles of international law by purporting to dispose of an entire nation without its consent and claimed the right to determine their own sovereignty. A representative assembly, convened at Eidsvoll, prepared and adopted on May 17, 1814, a national constitution based on the democratic models of the U.S., France (1791) and Spain (1812) and unanimously elected as king of Norway the viceroy Christian Frederick, who later succeeded to the throne of Denmark as Christian VIII. A Swedish invasion followed, but negotiations were almost simultaneously opened, and it was agreed that Norway should retain her independence and her new constitution, subject to a merely personal union under the Swedish king. Christian Frederick abdicated and left the country, and the terms drawn up in the convention of Moss (Aug. 14) were ratified by an extraordinary *storting* in November.

Charles XIV John.—The settlement thus reached held from the first the seeds of conflict and misunderstanding. Even Bernadotte, who succeeded to the dual monarchy as Charles XIV John on Charles XIII's death in 1818, believed that circumstances would soon bring about the complete absorption of Norway in Sweden, as he had originally planned—a view rendered plausible enough by the poverty and trade depression in Norway which followed the end of the Napoleonic wars and reduced the national finances to a parlous condition. The inevitably severe taxation made the new *storting* unpopular and led to a local rising of the peasantry in 1818, promoted by Halvor Hoel, a wealthy farmer in Hedemarken; this, however, was easily crushed. Swedish opinion generally continued to regard Norway as a conquered country and the treaty of Kiel as the title deed to it. Such an attitude naturally inflamed the outraged national sentiment of Norwegians and made them more than ever determined to guard and to emphasize their newly won independence. Moreover, the Norwegian constitution, based on Montesquieu's theory of complete separation between executive, legislature and judiciary, promoted conflict rather than collaboration between the first and second of these powers. The king, as head of the executive, controlled, among other things, the foreign affairs of both his kingdoms on which he was advised by a Swedish foreign minister; and his Norwegian councillors, whom he chose with little or no regard for public opinion as expressed in the *storting*, were excluded from membership or even from attendance in the legislature. Thus, while the *storting* grew increasingly democratic, executive power still rested with a bureaucracy appointed by the crown. The king was principally resident in Sweden and represented in Norway by a viceroy who was generally a Swede, so that Swedish influences predominated in all questions where the interests of the two countries differed.

Such a case arose in the "Bodö affair" of 1818–21, when an English merchant, who had been arrested on charges of smuggling and other irregularities (of which he was certainly guilty), launched a claim against the Norwegian authorities and, with the help of forged and falsified documents, succeeded, through British diplomatic pressure on the king and his Swedish advisers, in securing heavy damages which the Norwegian government was reluctantly compelled to pay. But even earlier the inevitable conflict had begun. When the Norwegian *stortings* of 1815 and 1818 passed a bill for the abolition of titles of nobility, the king at once exercised his constitutional right of veto and it ultimately became law without his sanction on its being passed by a third successive *storting* (1821). A further dispute arose over the settlement with Denmark of Norway's share in the joint national debt of the two countries. Charles John, with British mediation, concluded in Sept. 1819 a convention with Denmark, by which Norway was made liable for no more than 3,000,000 specie dollars (about £700,000). These terms, however, were accepted by the *storting* with a tardy recalcitrance that nearly occasioned a fresh intervention by the powers and made the king doubt the Norwegians' sincerity and, apparently, contemplate a coup d'état. In July 1821 he assembled a force including 3,000 Swedish troops near Christiania (Oslo), ostensibly for manoeuvres, having previously circularized the powers (June 1) with a note courting their sympathy for an attempt to force a revision of the constitution. Induced to abandon this idea, he submitted his proposals for revision to the *storting*, which however unanimously and repeatedly rejected them, thus coming to be regarded as the defender of the constitution against a would-be autocrat.

Trouble also arose over the king's attitude to the celebration of May 17 (on which day Christian Frederick had become king) as the anniversary of Norwegian independence, which he considered as a demonstration of disloyalty toward himself. His attempts to prohibit these celebrations culminated in 1829 in the "*torveslag*" or "battle of the market place," when an inoffensive gathering of both sexes was charged by soldiers on the orders of the Swedish viceroy.

In addition to these conflicts between the executive and the legislature, an antagonism soon developed in the *storting* itself between the views of representatives of the old governing class and the growing democratic aspirations of the peasantry. The constitution of 1814 was based on the democratic principle that the choice of a sovereign rested with the people, and the Eidsvoll assembly had had to be a widely representative gathering in order to bring home to the world the strength of national opinion on the issues involved. Nevertheless for some time afterward political power remained in the hands of the old official class, which indeed was the only one at that time experienced in the arts of government. The seeds of democracy, however, began to germinate after the "July revolution" in France and the similar disturbances throughout Europe (1830). From 1833 the peasant representation in the *storting* acquired a competent leader in Ole Gabriel Ueland, and an opposition developed to challenge the supremacy of the bureaucracy in the legislature as well as in the executive. The first important victory for democracy was won in 1837, when, after considerable difficulty in obtaining the royal assent, the local government of the country was placed on a popularly elected basis —a measure which contributed more perhaps than anything else to awaken and educate the political consciousness of the general population.

The tension between the king and the *storting* reached its climax in 1836, when Charles John arbitrarily dissolved the legislature and the latter retaliated by impeaching and fining a minister who had supported the king's decision. From this date to the close of his reign Charles John became more conciliatory, acquiring before his death (March 8, 1844) remarkable popularity with his Norwegian subjects. An important step toward this change was made in 1836, when the post of *stattholder* or viceroy was conferred on Count Wedel-Jarlsberg. But chief among the royal concessions was the permission, granted in 1838, for merchant ships to fly the Norwegian flag in all waters, its use having been previously severely restricted. The question of the general use of the national flag, destined later to emerge in another form, was under consideration by a mixed committee of Norwegians and Swedes at the time of the king's death.

Oscar I.—Charles XIV John's son and successor Oscar I (1844–59) soon showed his desire to meet the wishes of the Norwegian people, decreeing that in all documents concerning her internal government Norway was to stand first in the royal title; that Norway and Sweden should each carry its own national flag as the naval flag, with the mark of union in the upper corner; but that the merchant flag should bear the same mark of union.

The condition of the country had now considerably improved, and King Oscar's reign was marked by the carrying out of important legislative work and reforms. New roads were made, the first railway built, steamship routes established, lighthouses erected and trade and shipping developed. The abolition of the English Navigation acts in 1850 opened up a great future for the Norwegian merchant fleet.

In 1826, by the treaty of St. Petersburg, the frontier with Russia in the polar region had been definitely delimited; but in 1851 Russia demanded for her frontier Lapps the right to fish on the Norwegian coast and to settle upon a portion of the coast on the Varanger fjord. The Norwegian government refused, and serious complications might have ensued if the attention of Russia had not been turned in another direction. Durmg the Crimean War the king concluded a treaty with England and France by which these countries guaranteed Norwegian and Swedish territory against Russia. Relations with Russia therefore became strained; but after the peace of Paris in 1856 and the accession of Alexander II the Russian ambassador at Stockholm restored harmony.

Charles XV.—Because of the king's ill-health his son was appointed regent in 1857. Two years later he succeeded as Charles XV. This gifted, genial and noble king desired to inaugurate his reign by proof of his willingness to acknowledge the claims of Norway, but he did not live to see his wishes carried out. According to the constitution, the viceroy might be either a Norwegian or Swede. Since 1829 no Swede had held the post, and since 1859 no appointment had been made. But the paragraph in the constitution still existed, and the Norwegians naturally wished to have this stamp of "provinciality" obliterated. A proposal to abolish the office was passed by the *storting* in 1859. The king had privately promised that he would sanction the proposed change in the constitution; but a violent outcry arose in Sweden. Under pressure the king eventually refused to sanction the resolution; but he added that he shared the views of his Norwegian counsellors and would, when "convenient," himself propose the abolition.

In the following year the Swedish government pressed the demands of the Swedish estates for a common parliament which, according to population, would contain two Swedish members to every Norwegian. The Norwegian government did not seem at all disposed to entertain the proposal; but some dissensions arose with regard to the form of its reply. The more obstinate members of the ministry resigned, and others, of a more pliable nature, were appointed under the presidency of Fredrik Stang, minister of the interior from 1845 to 1856. Both the new and old governments agreed that no proposal for the revision of the Act of Union could then be entertained. The king, however, advocated a revision based upon full equality. In 1863 the *storting* assented to his appointment of a second Union committee. It was not until 1867 that its report was made public, and it could not be discussed by the *storting* before 1871. Meanwhile, Denmark's troubles over Schleswig-Holstein (1863–64) threatened to draw the two kingdoms into war. The king favoured a defensive alliance with Denmark, but the *storting* would only consent if an alliance could also be effected with at least one of the western powers.

In 1869 the *storting* passed a resolution by which its sessions were made annual instead of triennial. The first yearly *storting* in 1871 had once more to consider revision. The Norwegians steadily postulated: (1) the full equality of the two kingdoms; and (2) no extension of the bonds of the union. However, the new draft implied the supremacy of Sweden and introduced important extensions of the bonds of the union. Strangely enough, the new Stang ministry accepted it, and it was even supported by some of the most influential newspapers under the plausible garb of "Scandinavianism." In these circumstances the Lawyers' party, under the leadership of Johan Sverdrup, and the Peasant party, led by Sören Jaabaek, allied themselves to defend the constitution of 1814. Thus was founded the great national party of the Venstre ("the left"). The proposed revision in 1871 was rejected by an overwhelming majority.

In 1872 a private bill proposed that ministers should be admitted to the *storting* and take part in its proceedings. After stormy debates, Sverdrup carried the bill by a large majority, but the government, jealous of the new Liberal party, advised the king to refuse his sanction. In the preceding half century the government party had several times introduced a similar bill, but the opposition had feared lest the superior skill in debate and political experience of the ministers should turn the scale too readily in favour of government measures. Now, on the contrary, the opposition had gained more experience and had confidence in its own strength; but the government saw in the proposed reform the introduction of full parliamentary government, by which they could not remain in office unless supported by a majority. The Liberals carried a vote of censure against the government, but the king declared that the ministers enjoyed his confidence. Three, however, resigned, and enthusiastic public meetings were held all over the country in support of the proposed reform.

Oscar II.—In Sept. 1872, Charles XV was succeeded by his brother Oscar II, who in the following year sanctioned the abolition of the office of viceroy, the president of the ministry being afterward recognized as the prime minister. In 1874 the government, in order to show the people their good will, laid before the *storting* a royal proposition for the admittance of the ministers to the national assembly. But this was to be accompanied by other constitutional changes, such as the royal right of dissolving the *storting* and the providing of fixed pensions for former ministers, as a guarantee against the majority's misusing its new power. The bill was unanimously rejected by the *storting,* who in the same year and again in 1877 passed a modified version of the bill of 1872. On both occasions the king refused his sanction. The *storting* accordingly resorted to the procedure provided by the constitution to carry out the people's will: in 1880 the bill was passed for the third time, by 93 votes out of 113.

To the general surprise, the king again refused his sanction, declaring that his right to the absolute veto was "above all doubt." Sverdrup, the Liberal leader and president of the *storting,* therefore proposed that the bill, which had been passed three times, should be declared to be the law of the land. This was carried by a large majority on June 9, 1880, but the king and his ministers declared the resolution invalid. The faculty of law at the Christiania (Oslo) university with one dissentient upheld the king's right to the absolute veto in questions concerning amendments of the constitution, although they could not find that it was expressly stated in the fundamental law of the country. The ministry also advised the king to claim a veto in questions of supply, which still further increased the ill-feeling in the country against them.

The prime minister, Stang, now resigned, and C. A. Selmer became his successor—an appointment which indicated that the conflict was to be continued. In June 1882 the king came to dissolve the *storting* and astonished the people by censuring their representatives in a speech from the throne. In the elections the Liberals won 83 seats to the Conservatives' 31. The ministry, however, showed no sign of yielding and when the new *storting* met in Feb. 1883 the *odelsting* (the lower division of the national assembly) decided to impeach the whole of the ministry. They were charged with having acted contrary to the interests of the country by advising the king to refuse his sanction: first, to the amendment of the law for admitting the ministers to the *storting;* second, to a bill involving supply; and third, to a bill by which the *storting* could appoint additional directors on the state railways.

After ten months' trial, the *riksrett* sentenced Selmer and seven of his ministers to be deprived of their offices; while three, who had either recommended the king to sanction the bill for admitting the ministers to the *storting* or had entered the cabinet at a later date, were heavily fined. The excitement in the country rose to fever height. It was generally believed that the king would attempt a coup d'état. Fortunately, after some hesitation, he issued (March 11, 1884) an order in council announcing that the judgment would be carried into effect. King Oscar, however, in his declaration upheld the constitutional prerogative of the crown, and in April asked Christian Homann Schweigaard, one of the ministers who had been fined, to form a ministry. His "April ministry" sent in its resignation the following month; a similar nomination failed, and the king was at last compelled to appoint

Sverdrup. Thus the first Liberal ministry in Norway came into being (1884). The *storting* passed a new resolution admitting ministers and this received formal sanction. During the following years a series of important reforms was carried through.

In June 1889 Sverdrup resigned, and a Conservative ministry was formed by Emil Stang, Fredrik Stang's son. After two fruitful years this was wrecked on the diplomatic question. In 1814 nothing had been settled about the conduct of diplomatic affairs; in 1835 a resolution was issued which in effect gave Norway a right of inspection of business transacted on her behalf by the Swedish foreign minister with the king. The Swedes were willing to grant equal representation in a joint council, but on the assumption that the minister of foreign affairs should continue to be a Swede, and this the Norwegians would not accept. In 1891, after a deadlock, the Stang ministry resigned, and a Liberal ministry under Sverdrup's successor J. V. C. Steen, was appointed.

A new deadlock was produced by the resolve of the *storting* in 1892 to establish a separate consular service for Norway, which provoked the king's veto and the resignation of the ministry. By a compromise the ministry returned to office, on the understanding that the question was postponed. In 1893, the *storting* again passed a resolution for the establishment of the proposed consular service, but the king again refused his sanction. Upon this the Liberal ministry resigned (May 1893), and the king appointed a Conservative government, with Stang as its chief. At the end of 1894, when the triennial elections took place, the majority declared in favour of national independence on the great question then before the country. In 1895, after more than four months without a responsible government, a coalition ministry was formed, with G. F. Hagerup as prime minister. A new committee of Norwegians and Swedes spent more than two years in fruitless labour on the question of separate diplomatic representation. At the elections in 1897, 79 Liberals and 35 Conservatives were returned, and in Feb. 1898 Hagerup was replaced by Steen. Soon afterward the bill for the general adoption of the national or "pure" flag was carried for the third time and became law without the king's sanction. In 1898 universal political suffrage for men was passed by a large majority, but the proposal to include women received only 33 votes. Women received local-government franchise in 1901 and were to be granted a wide but restricted parliamentary suffrage in 1907. Universal political suffrage was not extended to them till 1913.

In Jan. 1902, on the initiative of the Swedish foreign minister Alfred Lagerheim, another joint committee on the consular question was appointed. It unanimously reported that "it was possible to appoint separate Norwegian consuls exclusively responsible to Norwegian authority and separate Swedish consuls exclusively responsible to Swedish authority." Further negotiations resulted in the so-called communiqué of March 24, 1903, announcing an agreement for separate consular services. In due course the Norwegian government submitted to the Swedish their draft of the proposed regulations, but received no reply for several months. The friendly Lagerheim resigned, and in Nov. 1904 E. G. Boström, the premier, suddenly submitted to Norway new conditions for the establishment of separate consuls. These placed the Norwegian consuls under the Swedish foreign minister, who could remove them. Hagerup proceeded to Stockholm, but no satisfactory agreement could be reached. The Norwegians felt themselves compelled to take matters into their own hands. On March 1, 1905, Hagerup resigned and was succeeded by Christian Michelsen and a ministry from both parties. It was resolved to establish a Norwegian consular service not later than April 1, 1906.

During the king's illness the crown prince vainly attempted to reopen negotiations. In April Boström resigned, apparently to facilitate negotiations. On May 23 the *storting* unanimously passed the bill, but on May 27, despite the entreaties of his Norwegian ministers, the king refused his sanction. The Norwegian ministry immediately resigned. The king refused their resignation, but they declined to withdraw it. On June 7 Michelsen informed the *storting* that, since an alternative government could not be formed, the personal union with Sweden was dissolved. The resigning ministry was unanimously authorized to exercise the authority vested in the king. The king sent a telegraphic protest to Michelsen and to the *storting*, and an extraordinary session of the *riksdag* (Swedish parliament) on June 20 appointed a special committee on the crisis. On July 25 it reported to the *riksdag* that Sweden should negotiate on the issue raised, if requested by a newly elected *storting* or a referendum. The report was unanimously adopted on July 27, and next day the *storting* decided on a general plebiscite. On Aug. 13 there were 368,211 votes for severance of the union and 184 against it. It was thereupon agreed that representatives of Norway and of Sweden should arrange for the separation. After more than three weeks' negotiation, agreement was reached on Sept. 23. This provided for a neutral zone on both sides of the southern frontier, the Norwegians undertaking to dismantle some fortifications within that zone. The agreement was to remain in force for ten years, renewable for a similar period, unless one country gave notice to the contrary. On Oct. 27, after ratification by *storting* and *riksdag*, the king relinquished the crown of Norway. Failing acceptance by a Bernadotte, it was conferred upon Prince Charles of Denmark by a second popular vote (259,563 against 69,264) and by the *storting* with no dissentients. On Nov. 25 the king, now Haakon VII, and Queen Maud, the youngest daughter of Edward VII of England, entered the Norwegian capital.

(W. F. Re; G. M. G-H.)

Haakon VII.—The truce to party politics created by unanimity on the question of terminating the Swedish union did not long survive the retirement of Michelsen in Oct. 1907. The coalition government continued for five more months, under the leadership of its former foreign minister Jorgen Lövland, but for the next 12 years the Liberal (Venstre) party generally maintained its predominance, though the elections of 1909 brought it a temporary setback in consequence of a split on the question of the Concession laws, which constituted the main political issue in the earlier years of this period. These laws were designed to control the power of foreign capital and, in the minds of the more radical politicians, of capital generally. They made the industrial exploitation of the natural resources of the country subject to a government concession, with eventual reversion to the state of the property involved, together with the plant and buildings erected upon it, without compensation. In consequence of the secessions from his party, Gunnar Knudsen's Liberal government, which was in power from 1908 to 1910, was succeeded by a coalition of Conservatives and moderate Liberals, under Wollert Konow and Jens Bratlie, till 1913, after which Knudsen ruled without a break until 1920.

The industrial developments with which the Concession laws were concerned were, however, symptomatic of a fundamental change in the economic life of the country, which fortuitously coincided with the restoration of Norwegian independence in 1905 and had far-reaching political and social consequences, including a disturbance of the existing balance of political forces. It was in 1905 that Sam Eyde founded Norsk Hydro, the great Norwegian nitrate organization, based on the use of hydroelectric power. The harnessing of Norway's enormous resources of water power started an industrial revolution with a suddenness which created problems and conflicts of capital and labour not previously experienced. Industrial disputes promoted the growth of organized labour and of a political Labour party the strength of which had hitherto been negligible. In these circumstances the dominance of the old Liberal party could not long continue.

World War I.—On the outbreak of World War I the three Scandinavian countries at once proclaimed a policy of neutrality primarily designed to preclude any possibility of hostile action between them. They co-operated closely, and numerous conferences were held between their representatives. Norwegian shipping, however, rendered most valuable services to Great Britain, and from 1917 such services were the subject of a comprehensive agreement with the Norwegian Shipping association. Losses of life and tonnage were heavy, but the profits earned were extremely large. The wave of speculation which ensued brought temporary prosperity to a new and undesirable class of capitalists and thus further embittered the relations between capital and labour.

1919–39.—The Labour party, at this stage, was of an extreme revolutionary type, and in 1919 it joined the Third International. Its growth in numbers, which in 1921 gained it 29 seats in the *storting,* reduced the Liberal forces to approximate equality with the Conservatives, though these old parties were still each considerably stronger than the Socialists: this situation led to a succession of short-lived governments, alternating between Conservative and Liberal, between 1920 and 1928.

In 1923 the Labour party withdrew from the Third International, and a Communist party was formed by its recalcitrant left wing. This split, however, did not entail any substantial loss, and in 1927 Labour became the strongest single party in the *storting,* with 59 seats. Its policy was still extreme enough to excite fear and suspicion in bourgeois circles, and when in Jan. 1928 it first assumed power as a minority government it only survived for a fortnight, being replaced by a Liberal administration under Johan Ludwig Mowinckel, who remained premier till 1935, except for a break in 1931–32, when an Agrarian government under Peder Kolstad was in office. Kolstad died in March 1932, and the leadership passed to Jens Hundseid until the fall of the government in Feb. 1933. The elections of 1933, however, gave Labour 69 seats, and from 1935 they remained securely in power, under Johan Nygaardsvold, though without an over-all majority until 1945.

After the settlement of the Concessions question, the principal domestic issue in the decade following World War I turned on the prohibition of intoxicating liquors, which had been introduced as a temporary expedient during the war and the continuance of which was supported by a referendum in Oct. 1919. The experiment proved unsatisfactory, leading to widespread smuggling and other evasions of the law, besides producing a trade conflict with Spain and Portugal which caused heavy loss to the fishing industry. The measure was repealed, except in relation to spirits, in 1923; the prohibition of spirits was likewise abandoned in 1927.

In external affairs the most important events were the recognition of Norwegian sovereignty over Spitsbergen (Svalbard) from 1925, and a dispute with Denmark over Norwegian rights in East Greenland, which was decided in favour of Denmark in 1933, by the Permanent Court of International Justice. For the last ten years preceding World War II Norway was seriously affected by the world economic crisis, and widespread unemployment promoted the progress of socialism.

World War II and After.—In the years following the World War I, Norway had been a loyal and active member of the League of Nations, in the work of which Fridtjof Nansen played a conspicuous part; but the experience of the Italo-Abyssinian conflict shook the country's faith in the security offered by this organization, and on July 1, 1936, Norway, together with its associates in the "Oslo group," repudiated the obligation to assist in the enforcement of sanctions under the covenant. The Norwegian government announced in April 1938 its intention to abstain from participation in the event of war.

On the outbreak of World War II in 1939 the Scandinavian countries together proclaimed their reversion to a policy of strict neutrality. This policy seemed at first sight to be more disadvantageous to the western allies than to Germany, which was able to use a long stretch of sheltered territorial waters for the conveyance of Swedish iron from the Norwegian port of Narvik. During the Russo-Finnish campaign of 1939–40, in which Norwegian sympathies were strongly pro-Finnish, France and Great Britain tried to induce Norway to abandon her neutrality sufficiently to allow the transit of Allied troops through Norway to Finland, but the request was refused. In Feb. 1940 British naval forces entered Norwegian territorial waters to rescue a number of Allied prisoners from the German vessel "Altmark," which had taken refuge in the Jössing fjord. On April 8 the Allies went further and announced the mining of various points in Norwegian territorial waters, with the object of preventing their use for the safe conveyance of German supplies. It was not, however, from the west that Norwegian neutrality was seriously threatened: on April 9, 1940, the country was suddenly invaded by Germany.

This event found the Norwegian people completely unprepared. During the interwar period, the defenses of the country had been neglected by all political parties for a variety of reasons. Faith in the protection afforded by the League of Nations and the prevalent view that the reduction of armaments was a virtue played an important part in the earlier stages. With the rise to power of the Labour party, motives of economy or of diverting expenditure from military to social objects combined with the ingrained pacifism of the older Socialists who were also afraid that the army might be used in internal conflicts to the detriment of the working class to produce a similar result. When war between Germany and the western powers became imminent, a considerable body of Norwegian opinion felt that their real interests and sympathies lay with the latter and that neutrality was more in the interests of the Germans than of their opponents. In these circumstances it was considered that any pressure to take sides was likely to come from a quarter which should not be too effectively resisted: it might be as well if the national defenses were not too strong. Halvdan Koht, the foreign minister, while he tried to the last to maintain a strictly neutral policy, was also obsessed with the idea that this neutrality was threatened from the west rather than from Germany and he accordingly ignored a number of warnings that reached him during the final days preceding the invasion.

The project of a German occupation of Norway was, however, under consideration in Germany as early as Oct. 1939, where it was strongly pressed by the admiralty. By the middle of Jan. 1940 the plan was adopted by Adolf Hitler, who had been more or less converted after an interview with the Norwegian traitor Vidkun Quisling in the previous month.

The destruction of the German cruiser "Blücher" by the Oscarsborg batteries in the narrows of the Oslo fjord threw out the German timetable sufficiently to enable the king and his government to escape from the capital to Elverum, where an extraordinary meeting of the *storting* voted full powers to the government to act during the emergency. The German demands, which included the appointment of Quisling to the premiership, were rejected by the king and his ministers, and active resistance by the improvised forces available at once began. This was continued for about two months, but by the beginning of June dangers on other fronts compelled the withdrawal of the assistance meanwhile provided by the Allies. The king and government moved to England at the same time, and active hostilities in the country came to an end. From London, nevertheless, the king and his ministers retained continuous contact, through the radio, with the loyal elements in Norway, while they had from the first succeeded in diverting practically the whole Norwegian merchant fleet to the service of the Allies, thus securing them a considerable advantage.

The Germans were remarkably slow in grasping the extent of the antagonism that they had aroused in the Norwegian population and made a particularly serious mistake in the support which they insisted on giving to Quisling and his party, who were despised by all but a negligible fraction. The people rapidly grew more and more united in opposition to the occupying power. In the temporary depression induced by the fall of France, indeed, there was a dangerous moment when the presidential board of the *storting* was prevailed upon to request the abdication of the king and the resignation of the government; but when this demand was met with a dignified refusal a bolder spirit quickly developed, and in September Germany was compelled to abandon the hope of giving to the occupation any appearance of voluntary acceptance by the Norwegian people. A German *Reichskommissar* was appointed, under whom various members of Quisling's party were given administrative charge of the different departments of state. In Feb. 1942 Quisling himself was raised to the position of "minister president" over a puppet government of his supporters; but this move effected no real change in the situation.

A home front growing spontaneously from the unco-ordinated efforts of individuals became increasingly organized under a central leadership whose members were soon in continuous touch with the Norwegian government in England. The directives issued through secret channels by this organization to the people found a ready and loyal response which obstructed in no small degree the plans of the occupying power and its puppets, while a large number of "illegal" newssheets spread Allied propaganda

and kept the population informed on the facts of the situation. Resort to guerrilla warfare or to unauthorized and sporadic acts of sabotage was wisely discouraged, though a secret military organization existed and was approved. The home front was drawn indifferently from all political parties and classes of the nation and thus fostered a new spirit of unity that ignored and discountenanced political antagonisms.

Immediately after the liberation of the country in May 1945, the government resigned in accordance with a pledge given during the war and was temporarily succeeded by a coalition under the premiership of Einar Gerhardsen. A general election was held in Oct. 1945, which returned the Labour party once more to power, with 76 seats out of 150. Gerhardsen remained prime minister. At the subsequent election of 1949, the situation remained substantially unchanged, though the strength of the dominant party increased to 85 seats and the Communists—who enjoyed a temporary prestige at the close of the war and gained 11 seats in the 1945 *storting*—did not return a single representative. In domestic affairs, the government was mainly occupied with the problems of postwar reconstruction, which were approached on lines laid down in an agreed program of all parties at the close of the war.

In the external field, however, the experience of World War II led Norway to a revolutionary departure from the policy of neutrality hitherto pursued. In the first years after the war, hopes in the security afforded by the United Nations combined with a traditional desire for Scandinavian unity to delay this change. The aspiration of all the Scandinavian states was, at first, to build a bridge between the conflicting ideals of the western world and Russia, while abstaining from association with a power bloc on either side. With the breakdown of the four-power conference in Dec. 1947, however, Norway began to entertain serious doubts as to the adequacy of the protection afforded by the United Nations, and after the Communist coup against Prague in Feb. 1948 the impracticability of a "bridge-building" policy became increasingly evident. The three Scandinavian states thereupon investigated the alternatives of association with the North Atlantic treaty and a neutral defensive alliance between themselves (as preferred by Sweden); but early in 1949 agreement proved impossible, and Norway turned to the North Atlantic treaty, to be followed more reluctantly by Denmark, who felt that it would otherwise be left in a position of helpless isolation.

POPULATION

The population of Norway at the census of 1946 was 3,156,950 as compared with 2,814,194 at that of 1930. Table I shows its distribution over the 20 counties (*fylker*).

TABLE I.—*Census, 1930 and 1946*

County	Area in sq.mi	Population 1930	Population 1946		
			Rural	Urban	Total
Southern:

Total	125,185	2,814,194	2,272,853	884,097	3,156,950

With an average population per square mile of only 25, Norway is the most thinly populated political unit in Europe. Towns are few and, apart from Oslo and Bergen, none has a population of more than 100,000. According to the census of 1946 Trondheim had 57,128 inhabitants, Stavanger 50,320, Drammen 26,994 and Kristiansand 24,343. In 1948 the adjoining district of Aker was incorporated with Oslo, thus increasing the population of the capital to 417,238 (on the basis of the figures of 1946) and the land area to 166 sq.mi. Most of the built-up areas are found along the coast, in the lowlands of the east (*Östlandet*), in the area around Trondheim (*Tröndelag*) and in the larger valleys. The most sparsely populated area is the north, particularly the county of Finnmark, where most of the 20,000 Lapps are found. By mid-20th century less than one-tenth of the Norwegian Lapps (*Samer*) were reindeer keepers; most had deserted their nomadic existence and settled as farmers and fishermen along the coast.

The population of Norway in 1801 was less than 1,000,000 but from 1815 there was a fairly rapid increase, much of it, however, absorbed by emigration, chiefly to the United States. Between 1836 and 1936 the total number of emigrants was 860,694. After 1931 emigration declined considerably, in view of immigration restrictions in the United States and increased economic opportunities at home.

The number of live births rose steadily from 41,321 (the smallest figure recorded in the 20th century) in 1935 to 70,727 in 1946 and then declined yearly to 63,236 in 1949. The excess of births over deaths was 34,653 in 1949. The live-birth rate in 1949 was 19.56 per 1,000 inhabitants, the death rate 8.84. The marriage rate, at 9.50 per 1,000 inhabitants, reached its peak in 1946. In 1946 there were 1,557,278 men and 1,599,672 women—an excess of women over men of 42,394 as compared with 70,356 in 1930. The percentage of illegitimate live births fell from 7.10 in 1930 to 5.77 in 1946 and 4.91 in 1948.

The age distribution of the population in 1946 was strongly influenced by the great variations in the birth rate—the fall from 1920 to 1935 and then the rise from 1935 to 1946. While the population increased as a whole by 12% from 1930 to 1946, the number of children under 15 diminished by 11%. The proportion of old people over working age was tending to increase.

Table II shows the number of persons with dependents engaged in various occupations, according to two censuses.

TABLE II.—*Employment*

Occupation	1930		1946	
Agriculture and forestry	838,848	(29.81%)	783,963	(24.83%)
Fishing and hunting	196,772	(6.99%)	183,922	(5.83%)
Industry and handicraft	783,547	(27.84%)	992,477	(31.44%)
Commerce	294,961	(10.48%)	313,389	(9.93%)
Communications	252,963	(8.99%)	287,821	(9.12%)
Administration, teaching, defense, etc.	156,177	(5.55%)	233,451	(7 39%)
Other occupations and none, or unstated	290,926	(10.34%)	361,927	(11.46%)

POLITICAL AND ECONOMIC CONDITIONS

Government and Law.—Norway is a constitutional and hereditary monarchy. The constitution or fundamental law (*grunnlov*) was adopted by the constituent assembly at Eidsvoll on May 17, 1814, and altered in detail at various times since. Executive power is vested in the king, exercised through a council of state consisting of the prime minister (*statsminister*) and at least seven other councillors (*statsråder*). The councillors are the heads of the ministries (*departementer*) of foreign affairs, industry, agriculture, social affairs, communications, justice, trade, fisheries, defense, finance, church and education, and municipal affairs and public works. The councillors sit in the parliament (*storting*) but do not vote. The king has no power to dissolve parliament, the life of parliament being fixed at four years. The 150 members of parliament (*stortingsmenn*) are elected directly by the people in electoral districts so arranged that the towns are represented by one-third of the total membership.

The franchise is enjoyed by all Norwegian citizens, men and women, over 21 years of age who have resided five years in the country. Candidates must possess the franchise in their constituencies, must have resided ten years in the country and must be over 21 years of age. Anyone who has held office as prime minister or councillor may stand for election outside his own constituency. Substitutes as well as members are elected. Parliament is elected in October every fourth year, meets in Oslo on the first weekday after Jan. 10 each year and remains assembled as long as may be found necessary. After the opening, parliament divides itself into two sections, the *lagting* consisting of 38 members and the *odelsting* of the remainder. A bill is first introduced in the *odelsting* and, if passed, is sent to the *lagting*. If the two sections do not agree, a joint session is held and a decision made by a two-thirds majority of the combined votes. A bill can become law without royal assent if passed by two ordinary sessions of parliament after two separate and successive elections, these sessions having to be separated by at least two other ordinary sessions of parliament, provided no divergent legislation has been passed between the first and last passage of the bill. Budget proposals and other financial and political questions not taking the form of bills are dealt with by parliament as a single body. There are a number of standing committees where most questions are discussed before reaching the full assembly.

The country is divided into 20 counties (*fylker; see* Table I), including the cities of Oslo and Bergen. There are 66 urban and 680 rural districts run by councils (*kommuner*) elected every fourth year. The electoral system for local councils is the same as the parliamentary system. Each council elects a presidency of one-quarter of its members. The chairmen of rural district councils in each county constitute the county council (*fylkesting*) presided over by the county governor (*fylkesmann*). The scope of municipal affairs in Norway is very wide. Revenue derives from local income tax, municipal trading profits and state grants.

Justice.—An outstanding characteristic of Norwegian legal procedure is that civil cases are usually brought first before the town or county mediation council (*forliksråd*) from which an appeal lies to the town and county courts (*by-og herredsrettene*) which are also tribunals of first instance. The town and county courts have a professional judge, sometimes assisted by two lay judges. There are five courts of appeal (*lagmannsretter*) in Oslo, Bergen, Trondheim, Skien and Tromsö, composed of three professional judges; and a supreme court (*höyesterett*) in Oslo, whose decision is final. Criminal cases are tried either in the *lagmannsrett* with three judges and ten jurors or in summary courts (*forhörsrett*) with one professional judge or in town and county courts with a professional judge usually assisted by two lay judges. The *lagmannsrett* is for more serious offenses; the others for minor offenses. Punishment takes the form of imprisonment and fines, capital punishment being abolished for all except certain military and treasonable crimes. There is a state police force subordinate to the ministry of justice.

Defense.—The king is supreme commander of the armed forces. Under the ministry of defense is a defense staff with combined control of all land, sea and air forces. There is a system of local command areas for the three services. A considerable reconstruction of the armed forces was started in 1945 and accelerated after 1949, when Norway subscribed to the North Atlantic treaty. Compulsory military service in peacetime was fixed at 12 months, with 3 months repetition training. In 1950 the total number of regular officers and noncommissioned officers was about 4,050; but about 200,000 men could be mobilized at short notice in all branches, including the national guard. The army could mobilize field units corresponding to about two divisions, with many of the men trained in Germany (where Norway after World War II maintained an occupation brigade of about 4,000). The national guard was formed in 1946 and soon had a membership of about 100,000, mostly volunteers. The air force supplemented its wartime British aircraft with Vampire and Thunderjet fighters. The navy in 1951 had as its main strength seven destroyers and five submarines and a number of corvettes, mine sweepers and motor torpedo boats. Coastal artillery, with powerful batteries left by the Germans, was concentrated in particular areas, and aircraft artillery was strengthened. Military budgets were: kr. 440,000,000 for 1949–50, kr. 520,000,000 for 1950–51 and kr. 700,000,000 for 1951–52. Air-raid precautions taken after World War II included the construction of underground shelters and power stations.

Religion, Education and Social Services.—The endowed state religion, to which the king must conform, is Evangelical Lutheran. There were 120,106 dissenters at the census of 1946, as compared with 91,459 at that of 1930. The king, with the advice of the ministry of church and education, appoints the clergy of the established church. Norway is divided into eight bishoprics (*bispedömmer*), with sees at Oslo, Trondheim, Stavanger, Hamar, Kristiansand, Bergen, Tromsö and Tönsberg; and these into 91 archdeaconries (*prostier*) with subdivisions into 533 clerical districts (*prestegjeld*) and 1,025 parishes (*sogn*). There are 17 organizations for missionary work abroad.

Elementary education has been free and compulsory for all Norwegian children between 7 and 14 years of age since 1860. Above the elementary schools are the secondary modern and grammar schools with three-year and five-year courses. There are also one-year continuation schools. Norway's two universities are at Oslo and Bergen, and there is a university college of technology at Trondheim. Educational institutions of high standing are the agricultural, dental, veterinary, commercial and teachers' colleges. Education is financed jointly by the state and the municipalities, and all instruction is free.

There are national insurance schemes to meet most contingencies. Compulsory health insurance was enacted in 1909, and 75% of the population receive medical and pecuniary benefits. Old-age pensions were introduced in 1936 for all citizens 70 or more years of age. There are accident-insurance schemes for industrial workers, seamen and fishermen. Compulsory unemployment insurance was introduced in 1938; family allowances in 1946; and holidays of three weeks with pay for all workers in 1947.

Economics.—For more than 30 years the economic life of Norway had developed on an increasingly industrial scale when the dissolution of the union between Norway and Sweden, in 1905, gave it a fresh impetus. Soon an extraordinary expansion set in, aided by the supply of cheap and plentiful hydroelectric power. This industrial expansion was further accelerated after 1945.

Agriculture and Forestry.—Agriculture remained one of the principal resources of the country, supporting 25% of the population in 1946, as against 30% in 1930. According to the agricultural census of 1949, 2.63% of the land area was cultivated, and there were altogether 345,125 farms and holdings, most of them very small and nearly all owned freehold by the farmers. Natural conditions are favourable to fodder growing and livestock keeping, and Norway is self-sufficient for nearly all livestock products. Only half the domestic consumption of cereals is produced in Norway: of 328,000 tons of grain harvested in 1949, half were of oats, a quarter barley and less than one-fifth wheat. More than 1,000,000 tons of potatoes and about 3,500,000 tons of hay and straw were produced.

Farmers derive an important part of their income from forest

holdings. Forests covered 24.30% of the land area in 1949. About 83% of the forest area was privately owned, while the state and local authorities owned the rest. There were about 120,000 forest holdings. For centuries sawn and planed timber was Norway's main forest export, but most of the timber is now exported as pulp and paper. Each year after 1945 about 247,202,900 cu.ft. of timber were cut for sale and about 1,000,000 tons of pulp and 500,000 of paper produced.

Fisheries.—According to the fisheries census of 1948 there were 85,518 fishermen, of whom 68,442 had fishing as their main occupation. There were 22,484 fishing vessels, of which half were decked motor vessels, mostly owned by the fishermen themselves. Fishing is carried on for the most part close to the shore. Catches exceed 1,000,000 tons a year and consist mainly of herring and cod. Much of the herring catch is processed into oil and meal. Pelagic whaling was pioneered by the Norwegians in the antarctic early in the 20th century. In the 1950–51 season Norway sent ten expeditions to the antarctic, and production of whale and sperm oil was about 185,000 tons.

Industrial Production.—The expansion of industry in the 20th century is particularly notable in the electrochemical and electrometallurgical spheres. The manufacture of pure nitrogen was 160,669 tons (equivalent to more than 1,000,000 tons of fertilizer products) in 1950, and more than 200,000 tons of ferroalloys and aluminum were produced, nearly all for export. The construction of electrical and other machinery and of ships also made marked headway. The mining industry, extracting mostly iron ore and pyrites, is concentrated mostly in the northern part of the country. Copper and zinc are important by-products, and the output of sulphur in 1950 was 96,000 tons. According to the census, 31.44% of the population was supported by industry in 1946, as compared with 27.84% in 1930.

After 1945 a determined effort was made to rebuild and strengthen Norway's economy. A high rate of investment, particularly in hydroelectric development, industry and shipping, was instituted. Of Norway's estimated 10,500,000 kw. of exploitable water power, about 1,960,000 had been harnessed by 1950, as against 1,377,000 in 1939. The output of electricity per capita was the highest of any country in the world. As the result of this expansion, the industrial production index for 1950 was 144 as against 68.6 for 1945 and 100 for 1938. In farming, fishing and forestry, production also improved through mechanization despite the loss of labour to industry. For the first six years at least after World War II the number of employed persons increased steadily.

Commerce.—Norway's foreign trade, which had always been large in relation to population, increased still more after 1945, and in 1950 the value of imports amounted to kr. 4,846,000,000 and that of exports to kr. 2,789,000,000. The large trade deficit was very largely financed by freight earnings and Marshall plan grants. Principal imports in 1950, in order of value, were: ships, kr. 845,000,000; textile goods, kr. 673,000,000; machinery, kr. 500,000,000; coal, oil and other fuel, kr. 488,000,000; grain, kr. 302,000,000; and iron and steel, kr. 294,000,000. Exports in the same year comprised: pulp, paper, etc., kr. 651,000,000; fish, kr. 454,000,000; fats and oils, kr. 381,000,000; nonferrous metals, kr. 277,000,000; fertilizers, kr. 210,000,000; and iron and steel, kr. 200,000,000. Relatively few sorts of commodity are exported from Norway: the products of the pulp and paper industry, the electrochemical and electrometallurgical industries and the fisheries together account for more than 70% of them.

On Sept. 1, 1951, the Norwegian merchant fleet amounted to 2,162 vessels or 5,654,535 gross tons, almost half the tonnage consisting of tankers. This fleet, which is the third largest in the world, lost half its tonnage during World War II but was rapidly rebuilt after 1945, with replacements mostly from British and Swedish yards. The great majority of the vessels are engaged in overseas traffic between foreign ports. Net foreign earnings by the fleet in 1950 were estimated at more than kr. 1,000,000,000.

State Control and Ownership.—After 1945 (when the Labour party secured a parliamentary majority which it was to increase in 1949), the economy of Norway was fairly strictly controlled and directed along the lines set out in the annual national budgets (economic surveys). Those budgets set out economic policy in such spheres as investment, consumption, imports, exports, manpower and materials. A system of licences, quotas, price controls and subsidies was used to ensure the desired development of the national economy. The government also influenced economic development by direct or indirect ownership or part-ownership of mines, factories and other concerns in such fields as aluminum, hydroelectricity, chemicals and transport. State monopolies over grain and alcohol had been set up before World War II.

Communications.—Norway, with its long, narrow stretch of land, its fjords, mountains and islands and its sparse population, presents transport problems of especial difficulty. Coastal shipping and ferry connections play an important role. The road system totalled almost 28,000 mi. in 1950. There were then 120,000 motor vehicles, including 65,000 private cars, 45,000 trucks (lorries) and more than 5,000 buses. The first railway, from Oslo to Eidsvoll, was opened in 1854. By 1950 the rail system covered 2,778 mi., of which less than a quarter was electrified. Most air traffic in Norway is based on Fornebu and Gardermoen airfields near Oslo, Sola airfield near Stavanger and Kjevik airfield near Kristiansand; elsewhere seaplane bases are used. The latter counted more than 100,000 passengers in 1950. In the same year there were 125 civilian aircraft.

Currency and Finance.—The unit of currency is the krone (100 öre: kr. 1). The value of the krone is fixed at 20 to the pound sterling and (since devaluation in 1949) 7.14 to the U.S. dollar. The gold stock of Norges Bank (Bank of Norway) in 1951 was kr. 185,000,000 (kr. 120,000,000 in 1939), and its foreign assets totalled kr. 732,000,000 at the end of 1951 (kr. 185,000,000 in 1939). Norges Bank, founded in 1816 and completely state-owned since 1949, is the sole note-issuing institution. Note circulation was kr. 575,000,000 in 1939, but increased greatly during World War II and stood in Jan. 1945 at kr. 3,015,000,000. Germany made drawings on Norges Bank amounting to kr. 11,300,000,000 during the war; the "occupation account" was reduced after the war and stood at kr. 6,202,000,000 in Dec. 1951. Reconstruction and economic expansion after the war made heavy demands on liquid funds, and though anti-inflationary measures halved the note circulation for a while, circulation had, by the end of 1951, gone up to kr. 2,610,000,000. Norges Bank's discount rate was reduced after the war from 3% to 2.5%. The government's fiscal policy after the war sought to establish stable economic conditions and yet encourage expansion. The increasing scale of government expenditure and revenue made state budgeting a decisive factor in the national economy. The growth of the state budget is shown in Table III.

TABLE III.—*Budgets*
(millions of kroner)

	1930–31	1939–40	1945–46	1950–51
Current income	346.1	641 1	1,590 2	3,091 7
Expenditure:				
Current	333 4	671 4	1,901.1	2,547.5
Capital	23.1	63 5	110 5	250.8
Balance	−10 4	−93 8	−421.4	+293.4

In the financial year 1950–51, taxes on income and capital raised kr. 925,800,000 of the government revenue. Most of the balance came from indirect taxes, including purchase tax. At the end of 1951 the national debt amounted to kr. 4,873,000,000, of which 1,173,000,000 represented foreign loans.

BIBLIOGRAPHY.—The Central Statistical Office in Oslo issues much useful material, including *Statistisk Årbok for Norge* with subject headings in French as well as Norwegian, *Økonomisk Utsyn over Året;* the monthly publications *Statistiske Meldinger* and *Månedsoppgaver over Vareomsetningen med Utlandet;* and occasional reports on particular subjects, including census findings. The most useful reference book in English is *The Norway Year Book* (Oslo) with chapters on most aspects of Norwegian life. Economic information is found in the bulletins in English issued several times a year by the Bank of Norway and the Norwegian joint stock banks. The compendious annual national budget is available in English summary from the Ministry of Trade, Oslo. The Norwegian Export Council (Oslo) publishes reports and books in English on Norwegian industries. The Norwegian Joint Committee on International Social Policy has issued

a number of booklets including *Social Insurance in Norway* (Oslo, 1949) and *Housing in Norway* (Oslo, 1951). Useful are the annual reports from Norway to the U.N. Food and Agriculture Organization. Other publications are: Royal Agricultural Society, *Norwegian Agriculture* (Oslo, 1951); Norges Industriforbund, *Industry in Norway* (Oslo, 1951); Walter Galenson, *Labour in Norway* (1948); Norwegian Federation of Labor, *The Trade Union Movement in Norway* (Oslo, 1951); O. B. Grimley, *Cooperatives in Norway* (Oslo, 1950); W. Warbey *et al., Modern Norway* (London, 1950). For an exhaustive geographical guide to Norway *see* Werner Werenskiold, *Norge Vårt Land,* 2 vol., new ed. (Oslo, 1950). (O. F. K.)

NORWAY, a city of Dickinson county, Mich., U.S., in the southern part of the Upper peninsula, on the Chicago and North Western railway and federal highways 2 and 141, near the Menominee river. Pop. (1950) 3,258; (1940) 3,728. Lumbering is the principal interest.

NORWEGIAN LANGUAGE. Norwegian, like English, is a Germanic language. The close relationship between the languages is apparent in both vocabulary and grammar; *e.g., arm* (arm), *land* (land), *rik* (rich), *binde* (bind), *mann, menn* (man, men), *vi, oss* (we, us), *god, bedre* (or *betre*), *best* (good, better, best), *leve, levde* (live, lived). The similarity may have been more perceptible in ancient days. Old sagas relate that Norsemen who came to England during the Anglo-Saxon period were understood when speaking their native tongue. Norwegian together with Danish and Swedish constitute the northern branch of the Germanic languages, which among other things agree on the specific use of a suffigated definite article; *e.g., arm-en* (the arm), *land-et* (the land). In general the Scandinavian peoples have never had much difficulty in understanding one another in either the spoken or written language.

History.—The oldest written form of Norwegian is found in the runic inscriptions. They disclose no evidence of dialect dissimilarities within Scandinavia, although these certainly existed in prehistoric time. By the end of the Viking age (about 1050), when the Latin alphabet was brought to Norway along with Christianity, the divergencies were so manifest that they justify a distinction between West Norse used in Norway and by Norwegian settlers in Iceland and the Faeroes, and East Norse, spoken by Danes and Swedes. The language in Norway up to the second half of the 14th century is called Old Norwegian, and it became the instrument of a high literary culture. During that period it was characterized by maintaining more of the diphthongs that were monophthongized in the neighbouring countries, such as *stein* (stone), *öy* (island), *lauv* (foliage), in contrast with Danish and Swedish *sten, ö, löv.* Like Swedish, Norwegian preserved the voiceless consonants *p, t, k* after a long vowel at the end of a syllable, where they were early changed into *b, d, g* in Danish; for instance, *krype* (creep), *fot* (foot), *bok* (book), Danish *krybe, fod, bog.* They also retained for a longer period the "full vowels" *a* and *o* (or *u*) in unaccented syllables, which in Danish were weakened into a slack *e* in that position. Thus large districts of Norway had, and still have, such forms as *leva* (live), *kastar* (throws), *timar* (hours), *visor* or *visur* (ballads), where Danish equivalents developed into *leve, kaster, timer, viser.* This accounts for Norwegian's generally preserving a distinction between three grammatical genders of the nouns, whereas in Danish masculine and feminine coalesced into a common gender taking the same suffigated definite article *-en.* However, there were never high linguistic barriers between the countries. Many of the dialects in the southeast of Norway, which from about 1300 became a political and cultural centre, evolved features like those of Swedish and Danish. This tendency strengthened the influence from abroad when Norway was politically united to Sweden in 1319 and to Denmark in 1380. But long before that the commercial and cultural contact with other European countries had led to the assimilation of many loan words into Norwegian. From English came at an early date religious words such as *kristen* (Christian), *prest* (priest), *biskop* (bishop), *kirke* (church). From French and Low German came terms of chivalry and commerce. The German impact grew particularly strong when trade began to be taken over by the Hanseatic league in the 13th century. The supremacy of Latin in Roman Catholic Church usage during the middle ages was seen in the introduction of a copious technical terminology and also a learned style which still prevails in religious and administrative literature.

The Middle Norwegian of the 15th and 16th centuries was marked by a development toward the later highly simplified grammar. The old four-case system of the nouns was being reduced, the nominative and accusative, partly also dative, getting the same form; even the genitive was in many instances superseded by prepositional expressions; *e.g., far til barnet* (father of the child) instead of *barnets far* (the child's father). The same tendency was to be seen in the declension of adjectives and pronouns, and the conjugation of verbs eventually grew quite independent of person and number.

This intrinsic evolution of a national language was modified by political events underlying the union of Norway and Denmark (1380–1814). During the 400 years of the union Danish influence on the language became more and more marked. Written Norwegian was gradually replaced by Danish in public administration, in the church, the schools and the courts of law. Official support for the spread of Danish in Norway was also helped by the fact that the dialects in some of the large cities and most densely populated areas in the southeast were subject to a linguistic development parallel to that of Denmark. After the dissolution of the union in 1814 Danish was used almost exclusively in official letters, printed books and newspaper articles. Certain scattered Norwegian elements were present only in cases where the writers had to express themselves on typically Norwegian topics. There were authors who tried to write perfect Danish, and grammarians would extirpate national elements which they considered provincialisms and vulgarisms. Even the spoken language was in some degree influenced by the written idiom, primarily on the stage and among persons of the higher professions, who took pride in attempting to speak a pure Danish. But they seldom attained more than pronouncing written Danish with a Norwegian accent, thus laying the foundation of a "solemn language" distinguished from the local vernacular. In the remote rural districts people used their native speech, little influenced by the written norm and less coloured by spoken Danish.

In the first half of the 19th century many persons were anxious to show that the reborn nation had a written language of its own, different from the foreign idiom. Authors and poets initiated the usage of distinctly Norwegian words and phrases in their works and sometimes wrote minor poems in country dialects. The collection of folklore in the 1840s had a decidedly national influence upon both style and morphology. The philologist Knud Knudsen (1812–95) laid the linguistic and practical foundation of a Norwegianized language and thereby made a valuable contribution to Norwegian literature. The language used by the realists in the second half of the 19th century could no longer be labelled Danish. Accordingly the terms Norwego-Danish, Dano-Norwegian and *riksmål* (state language) were employed. There were, however, others who cherished the plan of making a completely new national norm. In the mid-19th century Ivar Aasen (1813–96) constructed his *landsmål* (country language) on the basis of the spoken dialects throughout the country, particularly those freest from foreign influence and most in accord with the linguistic traditions of the classical past. Consequently, his normalized idiom acquired a rather old-fashioned appearance. It had a complex system of inflections, adopted three genders, the old full vowels and voiceless consonants, and also excluded many German loan words. This purism has, incidentally, also been noticeable as part of the policy to Norwegianize *riksmål.*

Bilingual Norway.—The new language was immediately put to use by Aasen himself and other eminent writers, and attempts were made to have it sanctioned officially. This was accomplished in 1885, when it was placed on a level equal with *riksmål.* From then Norway had two written languages, or rather two closely interrelated aspects of one language, *riksmål* and *landsmål;* after 1929 these were officially termed *bokmål* (book language) and *nynorsk* (new Norwegian). Local school boards decide whether *bokmål* or *nynorsk* is to be used in their community, but all schoolchildren learn both. In secondary schools students must acquire a writing proficiency in both forms. Laws and decrees, public post-

ers and forms may be printed in either form, and programs in *bokmål* and *nynorsk* are transmitted over the Norwegian state broadcasting system. Little by little *nynorsk* has gained a wider usage, not only in public administration but also in the press, literature, scientific publications and theatre. It has its stronghold, however, in rural districts, mainly in west and central Norway. *Bokmål* is used by the majority of the population and predominates in cities and densely inhabited districts and also in the northernmost counties.

During the 20th century there was a common desire to arrive at one norm suitable to all Norwegians. Action taken by the *storting* (Norwegian parliament) favoured a prospective synthesis of the two in the so-called *samnorsk* (combined Norwegian), and the spelling reforms of 1907, 1917 and 1938 were passed to that effect. They produced a steady Norwegianizing of *bokmål* and a concurrent simplification and modernizing of *nynorsk*. In 1952 a permanent language committee (Norsk Språknemnd) was established to bring the existing forms closer together.

Dialects.—The dialects of Norway are roughly divided into: (1) East Norwegian, the chief characteristics of which are the cacuminal, "thick" *l* in words like *dal* (dale), *kalv* (calf), and the double infinitive ending *-a* or *-e*, depending on the length of the verbal stem: *leva* (live) but *kalle* (call); (2) West Norwegian, with no thick *l*, and the infinitive ending irrespective of the length of the verbal stem: *leve, kalle* or *leva, kalla;* (3) North Norwegian, with traits common partly to East and partly to West Norwegian. Inside these groups there are many variations. The monophthongization of diphthongs occurs widely, especially in the east; the dialects north of a partition line across south Norway have the palatal pronunciation of *nn* and *ll* in words like *mann* and *kalle;* some dialects in a strip of land on the southern coast exhibit the above-mentioned transition *p, t, k* to *b, d, g*. Intonation and musical accent may differ considerably, but dialect differences do not at all prevent intercourse among persons. Improved communications of all descriptions are having a unifying and levelling effect upon the language.

Foreign Vocabulary.—The increasing international traffic strongly influenced the written and spoken language. The political development before, during and after World War II added notably to the stock of loan words, above all from English. Words like "all right," "shorts," "taxi," "film," technical terms such as "back," "halfback," "corner," "game" had been adopted long ago. Later incorporations were "tank," "jet," "jeep," "radar," and an influx of abbreviations such as U.N.E.S.C.O., U.N.R.R.A., F.A.O. and NATO. Norway on its part has contributed to the cosmopolitan vocabulary with *fiord, ski* and *slalom*. Quite significant was the expansion of Norwegian through immigration in the United States.

NORWEGIAN LITERATURE.

From a linguistic and artistic aspect the literature of ancient Norway is inextricably bound up with Icelandic; Old Norse literature, therefore, is dealt with under Iceland (*see* ICELANDIC LANGUAGE; ICELANDIC LITERATURE); yet it should not be forgotten that the psychological features revealed through the so-called *Elder Edda*, as well as through the sagas, are so typically Norwegian in all essentials that this literature forms the very basis on which the literary fabric of Norway has been raised in the course of centuries. The literature of the Old Norse language came to an end in the beginning of the 14th century simultaneously with the decline and fall of Norway as a sovereign state with a culture of its own. The chief characteristic of this literature, formed as it was in "an age of axes, an age of swords," is the remarkable fighting spirit by which it is pervaded and which quite naturally makes it abound in dramatic scenes and striking personalities; at the same time, in poetry as well as in prose, it is imbued by a serene view of life, which reveals a remarkably high moral standard. Another very distinct feature is its decidedly aristocratic leaning, with a pronounced hero-worshipping tendency, as might be expected in an age when the king generally appeared surrounded by his faithful chieftains and frequently with a young poet before him, singing his praises in glowing terms.

The Literary Revival.—Meanwhile the political union between Denmark and Norway (concluded in 1380) gradually brought Danish nobles and officials to the front in the latter country, with the result that the Old Norse language was replaced by Danish. This development, which constitutes perhaps the most remarkable event in the cultural history of the nation, may be considered as completed by the middle of the 16th century. Accordingly, when about the same time the literary revival set in, which to some extent was a result of the introduction into Norway of the Lutheran Reformation, the new literature came to be composed in the Danish language, which for nearly three centuries was to hold an unchallenged position as the official language of Norway.

The first outcome of the revival of literary interest in Norway was the appearance of the first book ever printed in Norway, an almanac, printed in Christiania in 1643. During the following years Christen Bang (1580–1678) published a number of religious tracts and also a *Description of Christiania* (1651), which at that time had only recently completed the 25th anniversary of its foundation. These curiosities, however, have nothing to do with literature in the true sense of the word, and the first name of importance in Norwegian literature after the spiritual revival in the Reformation century was Peder Claussön (1545–1614), a clergyman by profession and at the same time a highly gifted author who by his translation of Snorri Sturluson (*q.v.*) as well as by his independent works on Norway made a lasting reputation. The next striking personality in Norwegian literature is Petter Dass (1647–1708), whose *Nordlands Trompet* (*Clarion*) with its lyric-topographical description of the scenery and life of north Norway is still considered one of the gems of Norwegian literature. On the other hand, Dorthe Engelbrechtsdatter (1635–1716), who among her contemporaries enjoyed a great reputation as an author of religious poetry, is now practically forgotten.

Holberg.—Contrasted with these authors, all of whom spent their lives in Norway, Ludvig Holberg (1684–1754) (*q.v.*) early found his way not only out of Norway but out of Denmark. Leaving Norway for ever at the age of 21, after having taken his degrees at the University of Copenhagen, he went to England, where he studied for more than 18 months at Oxford, from which he carried with him an indelible impression of England and the English. Later travels brought him to France, Germany and Italy, but wherever he went he lived in the English world of thought and reasoned on the basis of his Oxford experiences. In this way, thanks to his inborn genius and his unbiased mind, he prepared himself for the life work by which he became the founder of modern Norwegian and modern Danish literature. He revolutionized the conception of life in two kingdoms and paved the way for the intellectual and political liberty of the future. His most famous works next to his comedies (*see* DRAMA: *Norwegian Drama*) are *Peder Paars* (1719), a heroic poem, the humour and satire of which has stood the test of two centuries; *Niels Klim's Underground Travel* (1741), originally written in Latin, a classic evidence of his mental independence; and finally, from the closing years of his life, his *Epistles* and *Moral Reflections,* which are the best source of information for Holberg students. Holberg restored the cultural connection between Norway, England and western Europe in general, which had been broken off since the end of the saga period.

English native poets, such as James Thomson and Edward Young, had their counterpart in Norway in Christian Tullin (1728–65), a manufacturer and merchant of importance in the business community of Christiania and a central figure in the extremely sociable life of the city. By his famous poem "The May-Day" (1758), composed on the occasion of a wedding among the "upper ten" of Christiania, Tullin became the first interpreter in Norwegian literature of the long pent-up love of nature which three-quarters of a century later found such splendid expression

in the poetry of H. A. Wergeland.

Det Norske Selskab.—Meanwhile, the importance of Holberg's work, along with a number of other factors, among them a constantly growing awareness of being an individual nation with historical traditions and cultural and economic possibilities, gradually began to prevail. The centre of this movement was Copenhagen, where the Norwegian students, partly graduates staying there in search of employment, felt themselves aliens in the midst of a display of public sympathy which made the name of Norway and the Norwegians resound in a way bearing promise for the future. In 1772, to mention a particular year of lasting importance in Norwegian literature, the Norwegian poets and other men of letters were so strong in Copenhagen that they formed a society which was to become famous under the name of Det Norske Selskab (the Norwegian society). The two most conspicuous members of this society with whom its name has forever been associated were Johan Herman Wessel (1742–85) and Johan Nordahl Brun (1745–1816); besides them should be mentioned Claus Fasting (1746–91), Claus Frimann (1746–1829) and his brother Peter Harboe Frimann (1752–1839), as also their younger contemporaries Jonas Rein (1760–1821) and Jens Zetlitz (1761–1821). No student of Norwegian literature who wants to understand the undercurrents in the Norwegian nation in the 40 years before the dissolution (1814) should pass by these poets, among whom Claus Frimann still lives in a few songs of popular reputation. The sovereign talent among them, however, is Wessel (*see* DRAMA: *Norwegian Drama*), the spiritual inheritor of Holberg, a champion in the fight against pedantry and prejudices, a *gamin* spirit full of irony and good humour in the midst of adversities.

Norwegian literature has no finer display of comic fiction than his three immortal poems "The Smith and the Baker," "The Dog-murder" and "The Fork," while a number of his pithy and pointed epigrams long ago became classic. Nordahl Brun's fame with posterity rests less on the poetic value of his works than on the tradition of his striking personality, which in his lifetime made him the very embodiment of the national aspirations of Norway.

The Renaissance of 1814.—In literature this renaissance, in its first stage, was represented by three poets, Henrik Anker Bjerregaard (1792–1842), Mauritz Christopher Hansen (1794–1842) and Conrad Nicolai Schwach (1793–1860). Bjerregaard was famous for his "Sönner av Norge" ("Sons of Norway"), written in 1820, which for half a century was the national anthem of Norway. His merry musical piece "A Highland Adventure" (1824) is inspired by a genuine love of nature and a sound common sense.

Wergeland and Welhaven.—The commanding genius of this generation is Henrik Arnold Wergeland (1808–45), (*q.v.*), who, as has justly been said, contrived within the limits of a life as short as Byron's to concentrate the labours of a dozen ordinary men of letters. As a poet he was inspired alike by an intense love of nature. Besides larger poems, among which may especially be mentioned *The English Pilot* (1844), he wrote in addition a quantity of lyrics with dramas, essays, historical works and journalistic articles—all stamped by his vivid imagination, many of them also by his sound common sense and his high moral standard.

His contemporary Johan Sebastian Cammermeyer Welhaven (1807–73) is primarily known for his highly critical nature, with its keen sense of beauty and harmony. His early poems are associated with his literary clash with Wergeland, but notwithstanding the interest attached to them for their polemic character, the memory of Welhaven as a poet chiefly rests upon his beautiful romances. This Romantic movement was evident about 1840, and it is the same spirit which led to the discovery of the folklore, with its wonderful prose and poetry, in which the soul of the nation and the nature of the country faithfully reflected themselves.

The ideal was that every piece of folklore should be rendered in the form given to it by the people in the course of time, and here the Norwegian nation was particularly fortunate. At the right moment the two friends Peter Christen Asbjörnsen (1812–85) and Jörgen Moe (1813–82), whose names are forever associated with the Norwegian folk tales which bid fair to challenge the most famous folk tales in any European country, made their appearance in literature. Asbjörnsen was a first-rate storyteller with a broad, jovial nature; Moe was a true poet with humour and a rare gift of self-criticism. There was also the Rev. Magnus Brostrup Landstad (1802–80), who in 1853 published his famous collection, *Norwegian Folk-Songs,* the poetical part of the Norwegian folklore of which the folk tales constitute the prose. The former are older than the latter and accordingly differ from them in several ways; but jointly they constitute what up to the middle of the 19th century was the missing link between the *Eddas* and the sagas on one side and the literature of modern Norway on the other.

The Landsmål Movement.—Along with this literary revival there also set in a linguistic and historical renaissance of paramount importance to literature as a whole. In 1848 Ivar Aasen (1813–96) published a grammar and in 1850 a dictionary of the Norwegian folk language, whereby the intimate connection between the peasant dialects of the day and the Old Norse language was revealed in the most convincing way. A few years after Aasen's appearance in literature the famous historian Peter Andreas Munch (1810–63) published his mighty work, *History of the Norwegian Nation* (8 vol., 1852–63), an event of paramount importance in the field of literature.

This Romantic movement leading to the foundation of the national stage in Norway, with Björnstjerne Björnson and Henrik Ibsen as the two pioneers (*see* DRAMA: *Norwegian Drama*), it is easy to see why both of them turned to the saga period for suitable subjects and characters. At the same time, however, realism had already set in. During the 1850s the Rev. Eilert Sundt (1817–75) started his epoch-making investigations of life and manners in the rural districts, which made the Norwegian peasant appear in a light considerably different from that in which he appeared in the flattering illumination of the former "peasant worship." Accordingly, Björnson's famous peasant novels, the first of which was *Synnöve Solbakken* (1857), of a decidedly poetical turn, must be described as imbued by romanticism more than by realism so far as the outward surroundings are concerned.

The Big Four.—In 1855 Camilla Collett (1813–95), Henrik Wergeland's sister, published her famous novel *The Governor's Daughters,* the first true description in Norwegian literature of ordinary life, which dealt a heavy blow to the conventional marriage and education of young girls. In this way Madame Collett became a pioneer in the movement for the emancipation of women in Norway to whom both Björnson and Ibsen felt themselves indebted. Next to Madame Collett, the fame of the realistic novel is chiefly developed through Jonas Lie (1833–1908) and Alexander Kielland (1849–1906), who, together with Ibsen and Björnson, constitute the famous constellation in the golden age of Norwegian literature popularly known as the "big four." Lie is the author of a number of pure, fresh and eminently characteristic novels dealing with various aspects of everyday life within different ranks of society. *The Pilot and His Wife* (1874), *Rutland* (1880) and *Go On!* (1882) should be mentioned in this connection, no less for the spirit of the white sails and foaming sea by which they are imbued than for their intimate humanity in substance and psychological analysis. The latter qualities also are displayed splendidly in *The Commander's Daughters* (1886) and *Matrimonial Life* (1887), which, together with his beautiful novel *The Family at Gilje* (1883), a masterpiece of historical review and human psychology dealing with life and characters of the 1840s, rank among the crowning works of Lie's extensive authorship. Contrasted with Lie, whose highly impressionistic style not infrequently becomes colloquial to a fault, Kielland is a sovereign master of form and at the same time a keen psychologist with a decided vein of irony and a heart full of compassion for human suffering. His social novels *Garmann and Worse* (1880) and *Skipper Worse* (1882) long ago became classic, as did a number of his short stories, which by their delicacy of style represent the highest attainment of modern Norwegian prose.

Among other authors from the same epoch should be mentioned Kristian Elster (1841–81), who showed great talent in his pessimistic novels *Tora Trondal* (1879) and *Dangerous People* (1881), and Amalie Skram (1847–1905), wife of the Danish novelist

Erik Skram, whose novels, while deficient in literary beauty, are of a considerable crude force and excellent in their local colour, dealing chiefly with Bergen and west coast life. The outstanding feature of all the writings of the 1880s, which may be described broadly as an age of entirely prosaic writers, is the "problem setting," to which there is no parallel in Norwegian literature and to which Björnson himself contributed in his great novel *Town and Harbour Beflagged* (1884), to mention one of the most typical "problem" novels of the age.

Vinje and Garborg.—The *landsmål* literature produced two remarkable authors, Aasmund Olafsen Vinje (1818–70) and Arne Garborg (1851–1924). Vinje was a fine lyric poet and a keen critic, who exercised a great influence on Ibsen in his first period as a dramatist and who, broadly speaking, was one of the most striking literary figures of the 1860s. Garborg, who was brought up under sternly pietistic influences in the southwest corner of Norway known as Jaeren, carried with him from these surroundings a gloomy view of life, but being at the same time a revolutionary spirit and an imaginative thinker with a considerable training, principally as a critic, he seemed predestined to make his appearance in literature. His novel *Peasant Students* (1883) is partly of a polemic nature. Like the rest of Garborg's novels (some of them so important that we might properly speak about the "big five") this was written in the *landsmål,* which at the time to a certain extent was a drawback to their circulation. In 1891, however, he suddenly turned to the *riksmål* in his extraordinary novel *Tired Men,* an exquisite example of Norwegian prose.

Hamsun.—Meanwhile another author had already made his appearance in Knut Hamsun (1859–1952) (*q.v.*), whose powerful romance *Hunger* (1888) marked a new departure in Norwegian literature. He was, in fact, its central figure throughout the 1890s in the midst of a number of authors of an entirely different stamp from those of the 1880s. The most unmistakable genius, however, was Hans Kinck (1865–1926). As a typical feature of the 1890s it should be mentioned especially that the art of poetry, which had been practically banished from Norwegian for a number of years, again had its exponents, chiefly in Niels Collett Vogt (1864–1937) and Vilhelm Krag (1871–1933). The sensitive spirit of the age, however, is revealed nowhere more remarkably than in Sigbjörn Obstfelder (1866–1900), whose exquisite poetry, as it can be studied in his *Posthumous Works,* is rivalled only by his fascinating prose. In both he gives promise of something new in Norwegian literature; the promise was unfulfilled because of his early death. At the same time the *landsmål* poetry witnessed a revival, chiefly through Per Sivle (1857–1904), an excellent national poet whose poems dealt with the episodes and characters of the saga period.

The consummate work in the *landsmål* lyric during the 1890s, however, is Garborg's *Haugtussa* (1895), inspired by the strange and impressive scenery of the Jaeren. Thus, at the end of the 19th century, there was a revival both in the *riksmål* and in the *landsmål* literature.

The first decade of the 20th century will be forever memorable for the deaths of the four greatest writers of the preceding age: Ibsen, Björnson, Lie and Kielland. Thereby the field of fiction was thrown open to a new generation of authors, who found themselves confronted with problems essentially different from those which had taxed the attention of the former generation. Norway was no longer the country of consuls, shipowners, vicars, rectors, chamberlains and estate owners, representing official views and opinions against which persons not "made of that self metal" occasionally revolted and always with deplorable result to their own social interests; nor was Norway the country of women suffering in silence under slow torture of an apparently correct marriage, or a country of workers imbued by a patriarchal respect for their employers, based on personal connections from generation to generation. It was a community in which democracy had established itself on a broad basis.

Recent Literature.—No dramatic work of lasting influence has appeared since the age of Ibsen and Björnson, but an examination of the history of the Norwegian novel leaves a more satisfactory impression. Hamsun produced works, generally written in an exquisite style and filled with an exuberant vitality, of which *Pan* (1895) and *The Growth of the Soil* (1917; English translation 1920) rank particularly high.

Kinck, who is by all critics admitted to be an author of rare gifts, has not yet received general recognition either at home or abroad. Yet by his daring metaphors, his exuberant passions, his deep psychology, supported by extensive historical studies, he is one of the most intimate guides to the depths of the Norwegian mind. His Hardanger novel, *The Avalanche* (1919–20), is considered his greatest work, but generally speaking he is at his best in the short story. Another important writer is Trygve Andersen (1867–1920), a self-controlled author with a limited production.

Besides these three poet-artists and classics should be mentioned Johan Bojer (1872–), whose novels have become famous in the English-speaking world and elsewhere. A more intimate author is Peter Egge (1869–), a conscientious writer with an artistic style which adds to his original gifts as a narrator and psychologist. These qualities are happily displayed in *Hanna Solstad* (1926), one of the finest novels written during the period.

The most remarkable figure in later Norwegian literature, however, was Sigrid Undset (1882–1949) (*q.v.*), who held a position of her own by her mighty cycles of historical novels, of which *Kristin Lavransdattar* (3 vol.) shows a remarkable psychological insight and a rare power of appreciating bygone ages.

One of the chief characteristics of Norwegian literature during the first half of the 20th century was the ever-increasing number of local authors who, substituting particular districts for the country as a whole, gave rise to local literature, partly written in the literary tongue of the country known as the *riksmål,* partly in the *landsmål,* or in a *riksmål* coloured to a marked degree by local dialects. Conspicuous among these authors were Oskar Braaten, Hans Aanrud (1863–1953), who scored success as a playwright of broad humour in the 1890s, and Johan Falkberget (1879–) —all typical east Norway novelists. Braaten's literary domain, not only as a playwright but as a novelist, was the industrial quarters of Oslo and its surrounding districts. Aanrud was a keen observer of life and manners in the midland countries round Lake Mjösen. Falkberget was intimately acquainted with the miners of the mountain districts of the valley of Österdalen.

Gabriel Scott, in an idyllic novel, *The Source* (1918), found an exquisite expression of the typical Sörland (literally Southerland) nature and Sörland temper as they reveal themselves all through the charming coastland. West Norway country life was ably sketched by Jens Tvedt (1857–1935), who wrote in the *landsmål.* The particular district of the north Trondhjem country known as the Valley of Namdalen produced in Olav Duun (1876–1939), whose works all dealt with life and manners in his native valley, the most gifted author of modern times writing in the *landsmål.* Another significant author in the same language is Kristofer Uppdal (1878–), originally a navvy, whose works are imbued by the ideals of the labour movement.

In poetry Niels Collett Vogt proclaimed his emotions in stanzas of vigorous and beautiful metaphors. Olaf Bull (1883–1933) combined to a rare degree a refined versification with silent resignation and lofty enthusiasm. Herman Wildenvey (1885–) sings out his joys, his cares and his whims in easy verses and metaphors, striking for felicity of phrase. Simultaneously with this lyric flourishing in the *riksmål,* the *landsmål* literature produced the genial lyric poet Olav Aukrust (1883–1929), inspired by a deep sense of spiritual strife and by religious visions.

NORWICH (nŏr′ĭj), **GEORGE GORING,** Earl of (1583?–1663), English soldier, son of George Goring of Hurstpierpoint and Ovingdean, Sussex. He was knighted in 1608 and became a favourite at court, benefiting largely from monopolies granted by Charles I. He became Baron Goring in 1628 and privy councillor in 1639. When the troubles between Charles and his

parliament became acute Goring devoted his fortune freely to the royal cause; and the king in November 1644 renewed for him the title of earl of Norwich which had become extinct at his uncle's death. He went with the queen to Holland in 1642 to raise money for the king, and in the autumn of the next year he was seeking arms and money from Mazarin in Paris. His proceedings were revealed to the parliament in January 1644 by an intercepted letter to Henrietta Maria. He was consequently impeached of high treason, and prudently remained abroad until 1647 when he received a pass from the parliament under a pretext of seeking reconciliation. Thus he was able to take a prominent part in the Second Civil War of 1648 (*see* GREAT REBELLION). He commanded the Kentish levies, which Fairfax dispersed at Maidstone and elsewhere, and was forced to surrender unconditionally at Colchester.

He was condemned to death on March 6, but petitions for mercy were presented to parliament, and Norwich's life was spared by the speaker's casting vote. He then joined the exiled court of Charles II, by whom he was employed in fruitless negotiations with the duke of Lorraine. He became captain of the king's guard at the Restoration, and in consideration of the fortune he had expended in the king's service a pension of £2,000 a year was granted him.

He died at Brentford on Jan. 6, 1663.

NORWICH, city and county borough of Norfolk, England, 114 mi. N.E. by N. from London. Pop. (1951) 121,226. Area 12.4 sq.mi. Served by the L.N.E., the L.M.S., and the M. and G.N. railways. Caistor-by-Norwich, 4 mi. S. of Norwich, is on the site of what was probably a Romano-British town. According to tradition Uffa made a fortification here about 570, but its history as a royal borough cannot be traced before the reign of Aethelstan (924–940), when it possessed a mint. After being destroyed by the Danes, Norwich enjoyed a period of prosperity under Danish influence and was one of the largest boroughs in the kingdom at the Conquest. Ralph de Guader, earl of East Anglia under William I, formed the nucleus of a French borough with different customs from the English, and after his forfeiture a castle was built and the centre of burghal life gradually transferred to the new community west of it. By 1158, when Henry II granted the burgesses a charter confirming their previous liberties, the two boroughs seem to have amalgamated. A fuller charter given by Richard I and confirmed by later sovereigns made Norwich a city enjoying the same liberties as London. The city lies in the valley of the Wensum, which joins the Yare immediately below. The ancient city lay in a deep bend of the Wensum, and the walls (1294–1342), with their many towers and 12 gatehouses, of which fragments only remain, were 4 mi. in circuit. These narrow limits, however, were outgrown even by 1671. Of the castle, only the early Norman square keep remains, with four tiers of arcading without, and an ornate doorway into the great tower. The building was acquired in 1884 by the corporation and in 1894 adapted as a museum and art gallery. It contains one of the finest collections of raptorial birds in Europe. The city established in 1608 a public library, the oldest provincial library with a continuous history.

The cathedral church of the Holy Trinity lies between the castle and the river. In 1094 the seat of the East Anglian bishopric was removed by Bishop Herbert de Lozinga or Lorraine from Thetford to Norwich, where in 1096 he laid the foundation of the cathedral and dedicated it in 1101, establishing at the same time a Benedictine monastery. As completed before the middle of the 12th century the cathedral was purely Norman; and it still retains its original plan. The Perpendicular spire belongs to the 15th century; the west window and porch and the lierne stone vaulting of the nave, with its 328 bosses, to the 15th, and to the 16th the vaulting of the transepts and Bishop Nix's chantry, while the fine cloisters, with 45 windows, were begun in 1297 and not completed till 1430. The chief entrance on the west is a Perpendicular archway, above which is a window of modern stained glass. The nave is divided by 14 semicircular arches, whose piers are in two instances ornamented with spiral mouldings. The triforium is composed of similar arches. The choir is of unusual length, and terminates in an apse. The oak stalls and *misereres* are of the 15th century. Of three circular apsidal chapels two remain. The War Memorial chapel (1932) replaced the old Lady chapel. In 1942 the cathedral was damaged in an air raid, the north transept suffering most. Two richly sculptured gateways lead to the cathedral—the Erpingham gate (1420) and the Ethelbert gateway (*c.* 1300).

The citizens obtained a charter (1404), making their city a county with a mayor and two sheriffs instead of four bailiffs, and Henry V added 24 aldermen and 60 common councilmen (1418). The cathedral precinct became parcel of the city at the Dissolution and in 1556 the neighbouring hamlets were incorporated in the county of Norwich. The charter of Charles II (1683) remained in force till 1835. The city in 1943 was governed by 16 aldermen and 48 councillors. The chief magistrate was created lord mayor in 1910. After 1298 Norwich was represented in parliament by two members. Two annual fairs, existing before 1332, were formally granted to the city in 1482. These have been succeeded by the Maunday Thursday horse and cattle fair, and the pleasure fairs of Easter and Christmas.

The market, which must have existed before the Conquest, was held daily in the 13th century, when citizens enclosed stalls by royal licence. Edward III made Norwich a staple town, and the importance of its trade in wool and worsted dates from his reign.

The majority of the Norwich churches are of Perpendicular flint work, mostly of the 15th century. Six churches and a synagogue were destroyed in 1942 during an air raid. At Carrow, east of the city, there remain the hall, a doorway, and other fragments of a Benedictine nunnery. The house in which Borrow resided with his parents when in Norwich is now a Borrow museum, and the Stranger's Hall, a 15th century house on Charing Cross, is an English Folk museum. In 1921 the city was presented with the Lazar House, a Norman relic contemporary with the cathedral, for a branch public library.

In 1925 Miss E. M. Colman, the first lady in England to be lord mayor, and her sister restored and presented to the city the 14th century Suckling House. The city Bridewell, late 14th century, is a museum of local industries, opened in 1925.

The grammar school is in a Decorated edifice, formerly a chapel of St. John, of *c.* 1316, with crypt below. Sir Edward Coke, Lord Nelson, Raja Brooke and George Borrow were educated here. St. Andrew's Hall is the seven-bayed nave of the Black Friars' church, rebuilt with the aid of the Erpinghams between 1440 and 1470. It is Perpendicular, with 28 clerestory windows and chestnut hammer-beam roof, and has served since the Reformation as a public hall. The guild-hall is a flint Perpendicular structure of 1408–13; the mayor's council-chamber, with furniture of the time of Henry VIII, is a specimen of a court of justice of that period.

The city regalia, kept here, include several objects of historical interest, among them a sword of a Spanish admiral captured by Nelson, with his autograph letter presenting it to the city, and a curious figure formerly used in the procession of the mayor elect through the city. A new city hall, however, was opened in 1938. The corporation owns an aerodrome on the outskirts of the city. The charitable institutions include St. Giles's or old men's hospital (an ancient foundation), and Doughty's hospital (1687).

The industries of Norwich include foundries and engineering works, ironware, brewing, brick works, chemical works, tanneries, and the production of mustard, starch, malt vinegar, chocolates, and crêpe, gauze and lace; and there are large boot and shoe factories.

The great cattle market lies below the castle.

The establishment of large housing estates on the outskirts of the city led to considerable changes in the centres of population.

NORWICH, a city of Connecticut, U.S., at the confluence of the Yantic and the Shetucket (Thames) rivers. It is on the Central Vermont and the New York, New Haven and Hartford railways. There is also a town of Norwich which incorporates the city of Norwich. Pop. of town and city combined, 37,571 in 1950; of city alone, 23,429. It is the seat of a state hospital for

the insane and a state tuberculosis sanatorium. Under a monument in Sachem street is buried the Mohegan chief Uncas, a friend to the early settlers; and in the eastern part of the city is a monument to Miantonomo, a Narraganset sachem who was put to death there. The channel of the Thames river is 25 ft. deep to Norwich. Its manufactures are varied, including cotton and woollen goods, velvets, Thermos bottles, locks, leather goods, shoes, paper boxes, textile printing, metals and machinery. Norwich was settled in 1659 by colonists from Saybrook, led by Capt. John Mason, who had crushed the Pequots in 1637, and the Rev. James Fitch, who became a missionary to the Mohegans. The land was bought from three Mohegan chiefs, and until 1662 the settlement was called Mohegan. It was the home of the Huntington family, which furnished many leaders in the civil and military affairs of the colony, the state and the nation; and the birthplace of Benedict Arnold, Mrs. Lydia H. Sigourney and Donald G. Mitchell ("Ik Marvel"). Before and during the Revolution the people of Norwich were ardent Whigs, boycotting English goods in 1767, ostracizing a schoolmaster (1770) who continued to drink tea, and disregarding the Stamp act in 1776. The town was chartered as a city in 1784. The *Bulletin,* a newspaper established in 1796, is still published.

NORWICH, a city of New York, U.S., on the Chenango river, 42 mi. N.E. of Binghamton; the county seat of Chenango county. It has an airport, and is served by the Lackawanna and the New York, Ontario and Western railways.

Pop. (1950) 8,816; (1940) 8,694 by the federal census. Norwich is a manufacturing city, in one of the principal dairying districts of the state.

Norwich was settled in 1792, incorporated as a village in 1857 and as a city in 1915.

NORWOOD, a residential area of London, Eng., partly in Surrey and partly in the county of London (metropolitan borough of Lambeth). The district is hilly and well wooded. It is divided into Upper, Lower, South and West Norwood.

NORWOOD, a town of Norfolk county, Mass., U.S., 14 mi. S.W. of Boston, on the Neponset river, and served by the New York, New Haven and Hartford railroad. The population was 16,636 in 1950 and 15,383 in 1940 by the federal census. It is a residential suburb, and it has important manufactures, notably roofing and siding, flooring, a tannery and the plants of three large printing and publishing houses. Norwood was incorporated (from parts of Dedham and Walpole) in 1872. In 1915 it adopted a municipal-manager form of government.

NORWOOD, a city of Hamilton county, O., U.S., adjoining Cincinnati on the northeast. It is served by the Baltimore and Ohio, the Pennsylvania and the Norfolk and Western railways.

The population was 35,001 in 1950 and was 34,010 in 1940 and 33,411 in 1930 by federal census. Developed originally as a residential suburb, it has extensive manufacturing industries. Playing cards, automobiles, trucks, laundry machinery, cans, office furniture and electric goods are leading products, and there are large printing and lithographing establishments.

Norwood was founded (as Sharpsburg) about 1798 and laid out in 1873; it was incorporated as a village in 1888 and chartered as a city in 1903.

NOSARI, or NAVSARI, a town in India, in the state of Baroda, and the capital of the gaekwar's southern possessions. It lies on the left bank of the Purna river, 147 mi. by rail N. of Bombay. Pop. (1941) 35,445. It is an ancient place, known to Ptolemy as Nasaripa. It was one of the earliest settlements of the Parsees in Gujarat, after their banishment from Persia in the 12th century. It is still the home of their *mobeds,* or sacerdotal class, and contains their most venerated "fire temple." The public buildings and the private houses, especially those in the suburbs, are unusually good.

NOSE, the organ of the sense of smell (*q.v.*) in man and other animals; it also acts as a filter and a warmer for inspired air (*see* OLFACTORY SYSTEM).

NOSOLOGY, that branch of medical science which deals with classification of diseases.

NOSSI-BÉ, properly Nòsy-bé (*i.e.,* "Great Island"), an island about 8 mi. off the N.W. coast of Madagascar, in 13° 23′ S., 48° 15′ E. It has an area of 130 sq.mi. Nossi-bé is volcanic, the north and south parts of older, the central part of more modern date. There are numerous volcanic craters and crater-lakes. (Lòkobé, the highest point, is 1,075 ft. above the sea.) The climate is trying, but European colonization is, nevertheless, highly developed. Pop. about 10,000. Hellville, the chief town (pop. 2,500) is a port of call for the Messageries Maritimes and a centre for the coasting trade along the western shores of Madagascar. There is excellent anchorage. The soil is very fertile, and there are forests of palms and bamboos. The chief products are coffee, sugarcane, cocoa, vanilla and tobacco. There are numerous sugar factories and rum distilleries. Shellfish, shells, mother of pearl, pearls and sponges are objects of trade.

In 1837 Tsioméko, chieftainess of one of the numerous divisions of the Sàkalàva, was expelled by the Hova and fled to Nossi-bé and to the neighbouring islet of Nossi-komba. She accepted French protection in 1840, ceding such rights as she possessed on the northwest coast of the mainland. The French took possession in 1841. Nossi-bé is under the administration of Madagascar (*q.v.*).

NOSTRADAMUS (1503–1566), the assumed name of MICHEL DE NOTREDAME, French astrologer, of Jewish origin, who was born at St. Remi in Provence on Dec. 13, 1503. After studying humanity and philosophy at Avignon, he took the degree of doctor of medicine at Montpellier in 1529. He settled at Agen, and in 1544 established himself at Salon near Aix in Provence. Both at Aix and at Lyons he acquired great distinction by his labours during outbreaks of the plague. In 1555 he published at Lyons a book of rhymed prophecies under the title of *Centuries,* which secured him the notice of Catherine de' Medici; and in 1558 he published an enlarged edition with a dedication to the king. The seeming fulfilment of some of his predictions increased his influence, and Charles IX named him physician in ordinary. He died on July 2, 1566.

The *Centuries* have been frequently reprinted, and have been the subject of many commentaries. Nostradamus also wrote a number of smaller treatises. *See* also Bareste, *Nostradamus* (Paris, 1840).

NOTARY, or NOTARY PUBLIC. In Roman law the *notarius* was originally a slave or freedman who took notes (*notae*) of judicial proceedings in shorthand. The modern notary corresponds rather to the *tabellio* or *tabularius* than to the *notarius.* In canon law it was a maxim that his evidence was worth that of two unskilled witnesses.

The office of notary in England is a very ancient one. It is mentioned in the Statute of Provisors, 25 Edward III, stat. 4. The English notary is an ecclesiastical officer, nominated, since the Peterpence Dispensations act, 1533–34, by the archbishop of Canterbury through the master of the faculties (now the judge of the provincial courts at Canterbury and York), in order to secure evidence as to the attestation of important documents. All registrars of ecclesiastical courts must be notaries. A notary's duties, however, are mainly secular. "The general functions of a notary consist in receiving all acts and contracts which must or are wished to be clothed with an authentic form; in conferring on such documents the required authenticity; in establishing their dates; in preserving originals or minutes of them which, when prepared in the style and with the seal of the notary, obtain the name of original acts; and in giving authentic copies of such acts" (Brooke, *On the Office of a Notary*). The act of a notary in authenticating or certifying a document is technically called a "notarial act." In most countries the notarial act is received in evidence as a semijudicial matter, and the certificate of a notary is probative of the facts certified. But English law does not recognize the notarial act to this extent. An English court will, in certain cases, take judicial notice of the seal of a notary, but not that the facts that he has certified are true, except in the case of a bill of exchange protested abroad. The file of a year's documents is often termed the protocol.

One of the numerous duties of an English notary is the noting and protest of foreign bills of exchange in case of nonacceptance or nonpayment. This must be done by a notary in

order that the holder may recover. He also prepares ship protests relating to mercantile matters, and authenticates and certifies copies of documents and attests instruments to be sent abroad. The office of notary is now usually held by a solicitor. In London he must be free of the Scriveners' Company.

In Scotland the office of notary is *munus publicum* and his notarial acts are probative. A roll of notaries public is kept, and under the Law Agents (Scotland) Act, 1873, any law agent is entitled to admission to the roll on payment of additional stamp duty. In addition to noting and protest of bills of exchange, notaries in Scotland have important functions in relation to completion of titles to land. They act as commissioners of the Sheriff Court of Chancery for taking affidavits in the process of service of heirs, they prepare and execute notarial instruments for giving service in land, and they may execute deeds notarially on behalf of persons who cannot write. Notaries also are supposed to keep their protocol books which are probative of the intimation of certain protests by mariners and others. Modern legislation has made serious inroads on the exclusiveness of the notary's functions.

In France, notaries receive all acts and contracts to which the parties thereto must give or desire to give the authenticity attached to the acts of a public authority; they certify the date, preserve the originals and give copies or duplicates. Notaries are nominated by the president of the republic on the recommendation of the keeper of the seals. They cannot act as notaries and also practise as advocates, or hold any magisterial office, nor can they engage in business.

In the more important British colonies and in foreign countries generally notaries are governed by special statutory legislation.

In the United States, the President appoints notaries in the District of Columbia, and the governor alone appoints them in most States. Many states have laws limiting the numbers who may be appointed for a particular county, usually a number in proportion to the population. Notaries are not empowered to act outside their own states, and often not outside their own counties. In most cases their seals must be affixed to the affidavit or other document. They attest deeds and other instruments, take affidavits and depositions and protest bills of exchange. Certain other officials may have notarial functions in addition, such as commissioners of deeds in New York state.

NOTE, a mark, particularly a sign by which a musical sound (also called a note) is indicated in writing (*see* MUSICAL NOTATION). A comment or addition added to a passage in a book, or a communication in writing shorter or less formal than a letter. The term is also applied to an abstract or memorandum of documents, speeches, etc., especially in the process of the transfer of land by fine and recovery (*see* FINE).

The ordinary distinction between note and letter is reversed in diplomacy. *Diplomatic notes* are written communications exchanged between diplomatic agents or between them and the ministers of foreign affairs of the government to which they are accredited. Sometimes, by agreement, a mere exchange of notes has the force of a convention. *Collective notes* are those signed by the representatives of several powers acting in concert. Sometimes *identical notes* are substituted for collective, *i.e.,* notes identical as to form and substance, but signed and delivered separately by the representatives of the several powers. *Circular notes* are those addressed by one power to the other powers generally. *Confidential notes* are directed to inspiring confidence by giving an explicit account of the views and intentions of the plenipotentiaries and their governments. The so-called *notes verbales* are unsigned, and are merely of the nature of memoranda of conversations, etc. *Notes ad referendum* are addressed by diplomatic agents to their own governments asking for fresh powers to deal with points not covered by their instructions. Diplomatic notes are usually, but not invariably, written in the third person.

For notes of hand or promissory notes *see* NEGOTIABLE INSTRUMENT and BILL OF EXCHANGE, and for notes passing as currency *see* BANKING; BANK NOTES, PRINTING OF; and POST AND POSTAL SERVICES.

NOTHOMB, JEAN BAPTISTE, BARON (1805–1881), Belgian statesman and diplomat, was born at Messancy in Luxemburg on July 3, 1805. He was educated at the Athenaeum of Luxemburg and the university of Liége. He was in Luxemburg when the revolution of August broke out, but was nominated a member of the commission appointed to draw up the constitution. He was a member of the national congress, and became secretary-general of the ministry of foreign affairs under Surlet de Chokier. He supported the candidature of the duke of Nemours, and joined in the proposal to offer the crown to Prince Leopold of Saxe-Coburg, being one of the delegates sent to London. When the Eighteen Articles were replaced by the Twenty-four less favourable to Belgium, he insisted on the necessity of compliance, and in 1839 he faced violent opposition to support the territorial cessions in Limburg and Luxemburg, which had remained an open question so long as Holland refused to acknowledge the Twenty-four Articles. His *Essai historique et politique sur la révolution belge* (1838) won for him the praise of Palmerston and the cross of the Legion of Honour from Louis Philippe. In 1837 he became minister of public works, and to him was largely due the rapid development of the Belgian railway system, and the increase in the mining industry. In 1840 he was sent as Belgian envoy to the Germanic confederation, and in 1841, on the fall of the Lebeau ministry, he organized the new cabinet. In 1845 he retired. He died at Berlin on Sept. 6, 1881.

See T. Juste, *Souvenirs du baron Nothomb* (Brussels, 1882); and F. de Ryckman de Betz, *Le Baron Nothomb et la question Luxembourg* (1918).

NOTICE, a term primarily meaning knowledge as in "judicial notice"; thence it comes to signify the means of bringing to knowledge, as in "notice to quit"; at last it may be used even for the actual writing by which notice is given. The most important legal uses of the word are judicial notice and the equitable doctrine of notice. Judicial notice is the recognition by courts of facts or events without proof. Thus in England and the United States the courts take judicial notice of the existence of States and sovereigns recognized by the sovereign of England, of the dates of the calendar, the date and place of the sittings of the legislature, etc. The equitable doctrine of notice is that a person who purchases an estate, although for valuable consideration, after notice of a prior equitable right, will not be enabled by getting in the legal estate to defeat that right. On the other hand, a purchaser for valuable consideration without notice of an adverse title is as a rule protected in his enjoyment of the property. Other common uses of the word are notice to quit, *i.e.,* a notice required to be given by a landlord to tenant, or by tenant to landlord in order to terminate a tenancy (*see* LANDLORD AND TENANT); notice of dishonour, *i.e.,* a notice that a bill of exchange has been dishonoured; notice of action, *i.e.,* a notice to a person of an action intended to be brought against him, which is required by statute to be given in certain cases; notice of trial, *i.e.,* the notice given by a plaintiff to a defendant that he intends to bring on the cause for trial; notice in lieu of personal service of a writ, *i.e.,* by advertisement or otherwise; notice given by one party in an action to the other, at a trial, to produce certain documents in his possession or power; notice to treat, given under the Land Clauses acts by public bodies having compulsory powers of purchasing land as a preliminary step to putting their powers in force. Notice may be either express or constructive. The latter is where knowledge of a fact is presumed from the circumstances of the case, *e.g.,* notice to a solicitor is usually constructive notice to the client. In the United States the doctrine of constructive notice is particularly important in view of the recording acts subordinating purchasers of real estate who have no actual notice of prior encumbrances on land to those whose rights have been placed on record in the registry of deeds, such purchasers being deemed to have constructive notice of whatever could have been discovered by an examination of the records. (*See* LAND TITLES.)

NOTKER, a name of frequent occurrence in the ecclesiastical history of the middle ages. NOTKER BALBULUS (*c.* 840–912) was a native of northern Switzerland, and for many years *magister* in the school of St. Gall. He compiled a martyrology and other works, but is famous for his services to church music and for the "sequences" of which he was the composer. He was canonized in

1513. His life is in the Bollandist *Acta Sanctorum*, April 6th. NOTKER LABEO (d. June 29, 1022) was also an instructor at St. Gall. His numerous translations, including those of the Old Testament Psalms, the categories of Aristotle, the *De nuptiis Mercurii et Philologiae* of Martianus Capella, and the *De consolatione* of Boëthius, into Old High German, may possibly have been the work of his pupils.

NOTO, city, Sicily, Italy, province of Syracuse, 20 mi. S.W. of it by rail, 520 ft. above sea-level. Pop. (1936) 18,923 (town), 29,992 (commune). The town, rebuilt after the earthquake of 1693, has some fine buildings of the early 18th century. The older town lies 10 mi. direct to the north (1,378 ft.). It was the ancient *Netum*, a city of Sicel origin, left to Hiero II by the Romans by the treaty of 263 B.C. Little remains but the ruins of the mediaeval town.

NOTRE DAME, UNIVERSITY OF, situated at Notre Dame, Ind., on a campus of 1,700 ac., was founded in 1842 by the Rev. Edward Sorin, C.S.C., and six brothers of the Congregation of Holy Cross, a religious community originating in France. The government of the university is vested in a corporation, which includes the trustees and an associate board of lay trustees, composed of alumni and nonalumni members.

The university is Roman Catholic, though about six per cent of the student body is non-Catholic. Until 1865 the only courses offered were classics and letters. Science was added in that year and in 1869 a law course, the first at any Catholic university in the United States. Engineering was inaugurated in 1873 and commerce in 1920. The more important buildings are the Administration building, with administrative offices, classrooms and art studios; the University church; and the library, with a capacity of 600,000 volumes. Special collections are the Zahm Dante library, the Edward L. Greene Botanical library and the Wightman Art gallery. Other buildings are Washington hall, the student auditorium with a wing for the department of music; the buildings for science, law, architecture, chemistry, commerce, biology and engineering; a gymnasium; a post office; a cafeteria; a student infirmary; residence halls for students; the Notre Dame stadium, with a capacity of 60,000; and a printing plant.

The bachelor and master degrees are conferred in practically all courses offered and the degree of doctor of philosophy in a number of the departments.

There were 4,968 students, including 421 graduate students, enrolled in 1949–50. (P. R. B.; X.)

NOTT, ELIPHALET (1773–1866), American divine, was born on June 25, 1773, at Ashford, Conn. He was pastor and teacher at Cherry Valley (N.Y.) (1796–97), pastor of the Presbyterian church in Albany (1798–1804), and thereafter president of Union college, Schenectady (N.Y.), a position which he held till his death on Jan. 29, 1866. He found the college financially embarrassed, but succeeded in placing it on a sound footing. He invented the first stove to burn anthracite coal.

NOTT, SIR WILLIAM (1782–1845), English general, was the second son of Charles Nott, a Herefordshire farmer, obtained a cadetship in the Indian army and proceeded to India in 1800. In 1839, he held a command at Quetta and in November 1840 he captured Khelat, and in the following year compelled Akbar Khan and other tribal chiefs to submit to the British. On receiving the news of the rising of the Afghans at Kabul in November 1841, Nott took energetic measures. On Dec. 23, the British envoy, Sir William Hay Macnaghten, was murdered at Kabul; and in Feb. 1842 the weak and incompetent commander-in-chief, General Elphinstone, sent orders that Kandahar was to be evacuated. Nott at once decided to disobey, on the supposition that Elphinstone was not a free agent at Kabul; and as soon as he heard the news of the massacre in the Khyber Pass, he urged the Government at Calcutta to maintain the garrison of Kandahar with a view to avenging the massacre and the murder of Macnaghten. In March he inflicted a severe defeat on the enemy near Kandahar, and in May drove them with heavy loss out of the Baba Wali Pass. In July he received orders from Lord Ellenborough, the governor-general of India, to evacuate Afghanistan, with permission to retire by Kabul. Nott arranged with Sir George Pollock, now commander-in-chief, to join him at Kabul. On Aug. 30 he routed the Afghans at Ghazni, and on Sept. 6 occupied the fortress, from which he carried away, by the governor-general's express instructions, the gates of the temple of Somnath; on the 17th he joined Pollock at Kabul. The combined army recrossed the Sutlej in December. (*See* AFGHANISTAN: *History*.) Nott was appointed resident at Lucknow and received the G.C.B. and a pension. He died at Carmarthen on Jan. 1, 1845.

NOTTINGHAM, EARLS OF. The English title of earl of Nottingham has been held by different families, notably by the Mowbrays (1377 to 1475; merged in the Norfolk title from 1397), the Howards (1596–1681), and the Finches (1681; since 1729 united with that of Winchilsea).

HENEAGE FINCH (1621–1682), first earl of Nottingham in the Finch line, lord chancellor of England, was descended from an old family (*see* FINCH, FINCH-HATTON), and was the eldest son of Sir Heneage Finch, recorder of London. He was educated at Westminster and at Christ Church, Oxford, and was called to the bar at the Inner Temple in 1645. He was a member of the convention parliament of April 1660, and shortly afterwards was appointed solicitor-general, being created a baronet. He sat in parliament for Oxford. In 1670 he became attorney-general, and in 1675 lord chancellor. He was created Baron Finch in 1674, and earl of Nottingham in May 1681. He died in Great Queen Street, London, on Dec. 18, 1682, and was buried in the church of Ravenstone in Bucks.

NOTTINGHAM, CHARLES HOWARD, 1ST EARL OF (in the Howard line) (1536–1624), English lord high admiral (also known as 2nd Lord Howard of Effingham), was the eldest son of William, 1st Baron Howard of Effingham, lord high admiral. He was nearly connected with Queen Elizabeth, his father's sister, Elizabeth Howard, being mother of Anne Boleyn. In 1559 he was sent as ambassador to France to congratulate Francis II. on his accession, and in 1569 was general of the horse under the earl of Warwick for suppressing the Roman Catholic rebellion in the north. The next year he commanded a squadron to watch the Spanish fleet which came to conduct the queen of Spain from Flanders. In the parliaments of 1563 and 1572 he represented Surrey, and succeeded to his father's title in 1573. He was installed a knight of the Garter in 1574, and made lord chamberlain of the household, an appointment which he retained till May 1585, when he became lord high admiral of England. He also filled the offices of lord lieutenant of Surrey and high steward of Kingston-upon-Thames. He was one of the commissioners at the trial of the conspirators in the Babington Plot and of Mary, queen of Scots, in 1586.

In Dec. 1587 he hoisted his flag on the "Ark." His letters at this time reflect vividly his sense of the impending danger. "For the love of Jesus Christ, Madam," he writes to Elizabeth, "awake thoroughly and see the villainous treasons round about you, against your Majesty and your realm, and draw your forces round about you like a mighty prince to defend you. Truly, Madam, if you do so, there is no cause for fear." On the approach of the Armada on July 6, 1588, Howard describes thus the disposal of his forces: "I have divided myself here into three parts, and yet we lie within sight of one another, so as if any of us do discover the Spanish fleet we give notice thereof presently the one to the other and thereupon repair and assemble together. I myself do lie in the middle of the channel with the greatest force. Sir Francis Drake hath 20 ships and 4 or 5 pinnaces which lie beyond Ushant and Mr. Hawkins with as many more lieth towards Scilly." He directed the various engagements (*see* ARMADA), and stayed himself to conduct the attack on the "San Lorenzo," stranded off Calais, arriving in consequence at the great fight off Gravelines some time after the engagement had begun. His tactics have been criticized both by contemporary and by later authorities. Instead of risking all in a pitched battle with the enemy, he resolved to pursue the less heroic method of "plucking their feathers little by little"; and his prudence, while justified by the extraordinary results, was also greatly praised by so good a judge as Raleigh. Shortly afterwards, under Howard's directions, a "Relation of Proceedings" was drawn up (now printed in the *Navy Records*

Society Publications, i 1–18).

In 1596 Howard and Essex commanded the expedition against Cadiz, when a squadron of the enemy's ships was destroyed and two of the number brought home. Essex insisted on landing, and Howard, who had been specially charged by Elizabeth to protect her favourite, was obliged to follow in his support. The town was sacked and the forts destroyed. Howard was created (Oct. 22, 1596) earl of Nottingham.

In February 1598, and again in 1599, when there were fears of invasion, Howard was appointed "Lord Lieut.-general of all England," and exercised full authority both over the army and the navy. He took a leading part in suppressing the rebellion of Essex, and served as a commissioner on his trial in 1601. It was to Nottingham that Elizabeth named James as her successor on her deathbed. He continued to hold office as lord high admiral under the new king, and in 1605 was despatched as ambassador to Spain, where he secured peace. He served on numerous commissions, including those on the union of the two kingdoms in 1604, for the trial of the conspirators of the Gunpowder Plot and of Henry Garnett in 1606, and for reviewing the articles and rules of the order of the Garter in 1618, and he attended Princess Elizabeth on her marriage to the elector palatine with a squadron to Flushing in 1613. Nottingham, who, unlike many of the Howards, was a staunch Protestant, was commissioner in Surrey for inquiring after recusants, and in the diocese of Winchester for hearing ecclesiastical causes; he sat on the government commission for discovering and expelling Roman Catholic priests, and was mentioned in 1602 from Douay as one of the three enemies most feared by the recusants.

On the report of the commission on the navy in 1618 and of the abuses then exposed, Lord Nottingham, though no blame was attached to himself, being now over 80 years of age, vacated his office of lord high admiral. He died at Haling house, near Croydon, on Dec. 14, 1624, and was buried at Reigate, a monument being afterwards placed to his memory in St. Margaret's church at Westminster. He was a striking and almost heroic figure in the Elizabethan annals. By his splendid character and services he was placed beyond the reach of the intrigues which troubled the reputation of many of his contemporaries.

Lord Nottingham married (1), in 1563, Catherine, daughter of Henry Carey, 1st Lord Hunsdon, (2), when in his 68th year, Margaret, daughter of James Stuart, earl of Murray.

NOTTINGHAM, a city, county borough, municipal and parliamentary borough and the county town of Nottinghamshire, England. Pop. (1938) 278,300. Area 25.3 sq.mi.

The highly advantageous position of Nottingham (*Snotengaham, Notingeham*) on the Trent, where it was crossed by an ancient highway, accounts for its origin. The Saxon form of the name is taken to refer to the caves, anciently used as dwelling-places, which were hollowed out in the Castle rock, in the Rock Holes west of the castle, in the suburb of Sneinton and elsewhere. It was chosen by the Danes for their winter quarters in 868, and constituted one of their five burghs. In 922 it was secured and fortified by Edward the Elder, who in 924 built a second "burgh" opposite the first and connected with it by a bridge over the river. In the time of Aethelstan, the successor of Edward the Elder, there was a royal mint there. In 1013 the town submitted to Sweyn. William I erected a castle, and mention of a new borough occurs in Domesday Book, and this seems to be the first evidence of the existence of the "French borough" which grew up in Nottingham under the Normans, and was distinguished from the English borough by the different customs which prevailed in it. Parliaments were held at Nottingham in 1334, 1337 and 1357, and it was the scene of the conference of the judges with Richard II in August 1387. David II of Scotland was imprisoned in the castle. Edward IV assembled his troops at Nottingham in 1461; and it was the headquarters of Richard III before the battle of Bosworth in 1485. In 1642 Charles I finally broke with the Parliament by setting up his standard at Nottingham, and during the ensuing Civil War the castle was held by each of the two parties more than once. In 1644 it was dismantled by Cromwell's orders.

The first charter (Henry II) confirmed to the burgesses the liberties they had under Henry I, referred to a market on Saturdays, and forbade the working of dyed cloth, except in Nottingham, within ten leagues of the borough. John confirmed this and granted a guild merchant. Henry III allowed the burgesses to hold the town in fee-farm, and Edward I granted them a mayor and two bailiffs, one to be chosen from each borough. Henry VI in 1448–49 confirmed all preceding privileges, first incorporated the mayor and burgesses, and granted that the town, except the castle and gaol, should be a county of itself. This grant was superseded by that of Victoria in 1897. Henry's charter remained, except for temporary surrenders under Charles II and James II, the governing charter of the corporation until the Municipal act of 1835. Nottingham returned two members to parliament from 1295 until 1885, when the number was increased to three, and again to four in 1918. Edward I granted an eight-days' fair in September and a fifteen-days' fair in November, the last altered by Richard II to a five-days' fair in February. Two other fairs were granted by Anne; one large fair, Goose fair, is still held. This begins on the first Thursday in October and lasts three days. The markets on Mondays and Saturdays are held by prescriptive right. Besides the Reform riots of 1831, Nottingham witnessed in 1811 the Luddite disturbances. In 1870 Nottingham was made the seat of a bishop suffragan in the diocese of Lincoln, but is now in the diocese of Southwell, created in 1884. In 1924 the Elizabethan Wollaton hall and park (744 ac.) were bought from Lord Middleton by the corporation. The hall in 1926 was made the natural history museum. In 1931 Sir Julien Cahn bought Newstead Abbey, 11 mi. N. of Nottingham, and presented it to the corporation. It was the home of the poet Lord Byron. In 1943 the city owned about 2.3 sq.mi. of parks and recreation grounds.

Nottingham stands on the Trent and Leen, 125 mi. N.N.W. of London by the L.M.S.R.; it is also served by the L.N.E.R. Water communications are afforded by the Grantham canal, the Nottingham and Erewash canals, communicating with the Cromford canal in Derbyshire, and by the Trent, which affords the city a highway to the sea. A railway line to Mansfield was opened in 1917, giving access to the docks at Immingham. An airport was established at Tollerton in 1938. The plan of the town is irregular and in the centre is an open market place 5½ ac. in area, but no longer used for market purposes. Its successor is the Central market, opened in 1928. Nottingham castle occupies a fine site to the south, on an abrupt rocky hill. The ancient remains include a restored Norman gateway and fragments of the fortifications. The site was acquired on a 500-yr. lease from 1875 by the corporation, and the building was opened as the Nottingham and Midland Counties Art museum. The church of St. Mary is a Perpendicular cruciform structure, with a central tower. St. Peter's church is mainly Perpendicular, but shows traces of an earlier building.

The University college, opened in 1881, contains the free municipal library. New buildings were built for the college by Sir Jesse Boot (later Lord Trent) on the west side of the town, on a site of 220 ac. called Highfields, and were opened in 1928. The free grammar school, founded in 1513, for some time in disuse, was revived in 1807, and on its removal in 1868 to new buildings, became known as the High school. There are also the Nottingham High school for girls; the blue-coat school, founded in 1723; and the Nottingham school of art, for which a fine building was erected in 1865 in the Italian style. The Midland Baptist college was transferred from Chilwell to Nottingham in 1882. The new Council House was opened in 1929. The General hospital was founded in 1781.

To the northwest, but within the city boundaries, are the industrial districts of Radford and Basford, beyond which lies Bulwell, with collieries, limestone quarries and earthenware manufactories. To the north, Sherwood is a growing residential district; another extends toward Gedling on the east. Southward, across the Trent, West Bridgford is another large residential suburb. To the west is Lenton; and Beeston has become a populous suburb mainly owing to the establishment of large cycle and motor works.

Nottingham itself became an important seat of the stocking trade toward the close of the 18th century. It was here that Richard Arkwright in 1769 erected his first spinning frame, and here James Hargreaves had the year previously removed with his spinning jenny, after his machine had been destroyed by a mob at Blackburn. Nottingham has devoted itself chiefly to cotton, silk and merino hosiery. Up to 1815 point lace was also an important manufacture. In 1808 and 1809 John Heathcoat obtained patents for machines for making bobbin net, which inaugurated a new era in the lace manufacture. The industries also include bleaching, the dyeing, spinning and twisting of silk, the spinning of cotton and woollen yarn, hosiery and drugs; the leather industry has grown considerably, and manufacture of boots and shoes, furniture making, rubber manufacture, engineering and brewing, cycle works and particularly tobacco factories are important, and the industries, especially the iron and steel and manufacture of machinery, have the advantage of the close proximity of coal mines. There is a large cattle market and a new wholesale fruit and vegetable market was opened in 1938.

NOTTINGHAMSHIRE, a county of England, area 844 square miles. The highest land, in places exceeding 600 ft., is found in the west between Nottingham and Mansfield. The hills die away eastward towards the basin of the Trent and Idle. In the Dukeries portions of the Sherwood forest are still preserved.

Early History.—In the limestone caves near Cresswell implements of presumably the Paleolithic age have been found along with remains of the mammoth, cave-lion, rhinoceros, etc., otherwise Nottinghamshire does not seem to have been inhabited until Neolithic times. The chief evidences of settlement in the Neolithic and Bronze ages come from the more open county of the southeast. The town of Nottingham, even in pre-Roman times, seems to have marked the point where the Trent was crossed by the tracks along which salt was distributed from Cheshire and Worcestershire. The presence of river and forest seemed to have caused the Romans to deflect the course of the Fosse Way northeastward from Leicester via Newark to Lincoln, and so they did not influence the history of the county profoundly. The earliest Teutonic settlers were an Anglian tribe who, not later than the 5th century, advanced from Lincolnshire along the Fosse Way, and settled in the fertile districts of the south and east. At the end of the 6th century Nottinghamshire already existed as organized territory, though its west limit probably extended no farther than the Saxon relics discovered at Oxton and Tuxford. Nottingham after the treaty of Wedmore became one of the five Danish boroughs. On the break-up of Mercia, Nottinghamshire was included in the earldom of the Middle English, but in 1049 it again became part of Leofric's earldom of Mercia. The first mention of the shire of Nottingham occurs in 1016, when it was harried by Canute. The boundaries have remained practically unaltered since the time of the Domesday Survey.

The most interesting historic figure in the Domesday Survey of Nottinghamshire is William Peverel. His fief represents the honour of Nottingham, and in 1068 he was appointed constable of the castle which William the Conqueror had raised at Nottingham. The chief lay tenant was Roger de Busli, while the majority of the church lands belonged to the archbishop of York. The Cliftons of Clifton and the Byrons of Newstead held lands in Nottinghamshire at the time of the Survey. Holme Pierrepoint belonged to the Pierrepoints from the time of Edward I.; Shelford was the seat of the Stanhopes, and Langer of the Tibetots, afterwards earls of Worcester. Archbishop Cranmer was a descendant of the Cranmers of Aslockton near Bingham. Of the old castles the principal remains are those at Newark, but there are several old mansions as at Kingshaugh, Scrooby, Shelford, Southwell, Wollaton Hall, near Nottingham (*c.* 1580). The more modern mansions are Welbeck and others in the Dukeries (*q.v.*). Nottinghamshire was originally included in the diocese and province of York, and in 1291 formed an archdeaconry. After the Conquest several monastic establishments were founded, and at the dissolution of the monasteries there were no fewer than 40 religious houses. The only important monastic remains, however, are those at Newstead.

Until 1568 Nottinghamshire was united with Derbyshire under one sheriff, the courts and tourns being held at Nottingham until the reign of Henry III., when with the assizes for both counties they were removed to Derby. In the time of Edward I., the assizes were again held at Nottingham, where they are held at the present day. The Peverel Court, founded before 1113 for the recovery of small debts, had jurisdiction over 127 towns in Nottinghamshire, and was held at Nottingham until 1321, in 1330 at Algarthorpe and in 1790 at Lenton, being abolished in 1849.

In the Wars of the Roses the county as a whole favoured the Yorkist cause, Nottingham being one of the most useful stations of Edward IV. In the Civil War of the 17th century most of the nobility favoured the Royalist cause, but Nottingham Castle was garrisoned for the parliament, and in 1651 was ordered to be demolished.

Industries.—The malting and woollen industries flourished in Norman times. The latter declined in the 16th century, and was superseded by the hosiery manufacture which sprang up after the invention of the stocking loom in 1589. The earliest evidence of the working of the Nottinghamshire coalfield is in 1259, when Queen Eleanor was unable to remain on account of the smoke of the sea coal. Worksop was formerly famous for its liquorice. Numerous cotton mills were erected in Nottinghamshire in the 18th century, and there were silk mills at Nottingham. The manufacture of tambour lace existed in the 18th century, and was facilitated in the 19th century by the manufacture of machine-made net. Coal is mined chiefly around Nottingham, Mansfield and Worksop. Clay, sandstone and limestone are also extensively raised. Nottingham is the principal centre of the lace and hosiery industries. There are silk, worsted and cotton mills, machinery works and cycle and motor manufactures. The manufacture of tobacco is considerable at Nottingham and Hucknall.

In 1939, 403,155 ac. were under crops and grass, the most fertile land lying on the alluvium along the Trent. The chief grain crops were wheat and oats, with 48,522 ac. and 28,732 ac., respectively, barley occupying only 8,636 ac. Turnips and swedes at 10,211 ac. occupied almost as much acreage as potatoes and mangolds, while there were 22,111 ac. of clover and rotation grasses for hay. Beans occupied 4,505 and sugar beets 7,882 ac. Apples and pears are grown. The shire raises cattle, chiefly shorthorn, and dairying is extensively practised. Sheep are not numerous, the chief breed being Leicesters and various crosses.

Communications, Population.—The L.M.S.R. and L.N.E.R. serve the county. The Trent is navigable throughout the county and the Idle between Bawtry and the Trent. A few canals centre upon Nottingham. There were 1,371 mi. of roads in the county in 1943. Area of administrative county 818.5 sq.mi.; pop. (1938) 470,900. Population movements of World War II had raised the population of Nottinghamshire by only 1% by Feb. 1941. The county contains the city and county and municipal borough of Nottingham, the municipal boroughs of Retford or East Retford, Mansfield, Newark and Worksop, and ten urban districts. For parliamentary purposes the county is divided into five divisions (Bassetlaw, Broxtowe, Newark, Rushcliffe and Mansfield), each returning one member; and Nottingham returns one member for each of its four divisions. There is one court of quarter sessions, and there are seven petty sessional divisions. The shire, which contains six wapentakes, is in the diocese of Southwell.

Thoresby, 3 vols., London, 1797); Thomas Bailey, *Annals of Nottinghamshire* (4 vols., 1852–56); J. P. Briscoe, *Old Nottinghamshire* (1881); J. Ward, *Descriptive Catalogue of Books relating to Nottinghamshire* (Nottingham, 1892).

NOÜMENON, a philosophical term put into currency by Kant and not much used except in definite reference to his doctrine. In the Kantian system the term "noümena" means things in-themselves as opposed to "phenomena" or things as they appear to us. According to Kant the human mind is such that it can never penetrate by its speculative powers to things-in-themselves, but can only know phenomena. Thus we have the odd position that noümena, or the contents of the intelligible world, are just the things to which thought can never penetrate. The term,

however, is a relic of an early period of Kant's mental development. In his fully mature or critical position he held that the noümenal was inaccessible to the speculative reason, and yet that we are not altogether excluded from it, since the practical reason, *i.e.,* our capacity for acting as moral agents, assures us of the existence of a noümenal world wherein freedom, God and immortality have a real place.

The relation of noümena to phenomena in the Kantian system is a most difficult one; and, in view of the fact that the acutest intellects in Europe have been engaged vainly for more than a century in reconciling the various passages on the subject, the safest conclusion is that they are irreconcilable. The course adopted by Kant's immediate successors in German idealism was to reject the whole conception of noümena, for the reason that what is essentially unknowable has no existence for our intelligence.

Kant, however, protested strongly against this development when it was propounded by Fichte, and held that he had precluded it by his "refutation of idealism": he stood unshakably to the belief in an absolutely real world behind phenomena.

Kant's position may be illogical as he himself stated it, but it is the expression of a sound principle: we must connect it with his general tendency to recognize the dynamic side of things. He saw, what so many of his successors failed to see, that the world as we know it is an expression of power; and he could not imagine whence the power could come if not from a world beyond phenomena.

(*See* Kant, Immanuel; Phenomenon.)

NOVA AND SUPERNOVA. A nova is a variable star which brightens up for a short time to a luminosity far exceeding that of its normal state. In typical novae, only one such outburst is on record, though a few recurrent nova-like stars are known (*e.g.,* Nova Coronae Borealis, 1866 and 1946).

A supernova is a nova of very great absolute brightness, and is distinguished by a type of spectrum somewhat different from that of common novae.

In the outburst of a common nova the following phenomena are observed: (1) a very rapid brightening (usually many thousandfold in two or three days) followed by a slower fluctuating decline of brightness; (2) a remarkable sequence of changes in the star's spectrum, which near maximum contains dark lines due to hydrogen and ionized metals (such as iron, calcium, etc.), later shows bright lines of the same elements and eventually develops into a spectrum of bright lines due to ionized atoms of oxygen, nitrogen and helium. like that of a gaseous nebula; (3) the steady expansion of a nebulous disk around the star for several years and eventual fading of this nebula, leaving the star with nearly the same brightness as before the outburst.

The first recorded nova of modern times was Nova Cassiopeiae, 1572, studied by Tycho Brahe, who concluded it belonged to the stellar universe outside the solar system. This nova at maximum was brighter than the planet Venus and easily seen at midday. It is almost certain that it was a supernova.

The first study of a nova with the spectroscope was made by Sir William Huggins, who observed in the spectrum of Nova Coronae Borealis, 1866, bright lines of hydrogen and many absorption lines. Nova Cygni, 1876, was observed by M. A. Cornu, who noted the similarity of its bright-line spectrum to that of the chromospheric layer of the sun's atmosphere which flashes into view as the sun's disk is hidden by the moon at a total eclipse. The first extensive photographic record of a nova spectrum was made of Nova Aurigae, 1891, and showed broadened bright lines with dark lines on their edges of shorter wave length. Such structure is typical of the spectra of novae just after maximum light, and is readily interpreted in terms of the "Doppler effect" (*q.v.*) of velocity of a source of light upon the wave length of the light. The broad bright lines are due to incandescent gases rushing outward from the star in all directions with speeds of hundreds of miles per second. The dark lines are due to absorption of light by the gases between the earth and the star, and the speed of approach shifts these lines toward the violet.

The same expanding cloud of gas eventually becomes large enough to be visible as a hazy disk around the star and expands continuously until it fades away. Such nebulous disks were prominent around Nova Persei, 1901, Nova Aquilae, 1918 and Nova Herculis, 1934. The matter thus ejected is only a minute fraction of the total material comprising the star.

The light variation of a supernova is similar to that of a common nova, but the spectrum consists exclusively of hazy, broad, bright bands. No dark lines have been observed. The Crab Nebula in Taurus is the expanding nebulous remnant of a supernova that was observed by Chinese astronomers in A.D. 1054.

Up to 1944, inclusive, about 100 novae had been recorded in our own galaxy, or star system. Most of these appeared in or near the Milky Way. Their distances range from a few hundred to many thousand light-years. They are strongly concentrated in the direction of the star clouds of Sagittarius; this is the direction in which the centre of our galaxy lies. In the Andromeda spiral nebula (another galaxy about 750,000 light-years distant) a supernova appeared in 1885, and more than 100 common novae have been found, chiefly by Edwin P. Hubble, of the Mount Wilson observatory. Supernovae have been found in many other more distant spiral nebulae in which ordinary stars are quite indistinguishable.

At maximum brightness reliable determinations give absolute magnitudes of individual novae from -4 to -9, with an average near -7, or about 60,000 times the sun's luminosity. At minimum light their luminosities are comparable to that of the sun (absolute magnitude $+5$). The postnova stars are much smaller than the sun but much hotter and denser, and the conditions before the outburst, though not accurately observed, were probably similar. Supernovae at maximum have absolute magnitudes from -12 to -16, or 6,000,000 to 240,000,000 times as bright as the sun. Their condition at minimum is unknown.

Several theories have been devised to account for the explosions of novae. These have included: collision of two stars, or of a planet with a star; eruption of matter due to tidal action of another closely approaching star; and the plunge of a star into a nebula. The collision and tidal theories are inadequate to account for the observed frequency of novae.

The fact that novae at minimum are a very special and peculiar class of stars is opposed to any theory of an accidental cause, including plunge into a nebula. The existence of some novae for which more than one outburst has been observed, their similarity to true recurrent variables of the U Geminorum and other types, the existence in some cases of variability before the explosion and the characteristics of high density and high temperature at minimum light, all suggest that explosive variability is an inherent characteristic of this well-defined class of stars.

The collapse of a normal star to a condition of very high density, as proposed by Edwin Arthur Milne, George Gamow and others, is favourably regarded as a possible cause of a supernova. L. Biermann has suggested that a readjustment in an unstable zone beneath the surface of a dense star would account for the eruption of a common nova. It is best to admit that the actual cause of the outburst is unknown, though the physical processes that follow the explosion are fairly well understood.

NOVACULITE is a hard, compact, homogeneous, finely granular rock closely resembling chert and consisting of nearly pure silica. The rock has typically a vitreous lustre and white colour. It breaks with conchoidal fracture, and thin edges are translucent. The largest known deposits, Devonian in age, are in the Ouachita mountains of Arkansas and Oklahoma where novaculite occurs as beds from a few inches to ten feet thick, interbedded with shales, forming many of the mountain ridges. It was first quarried in the early 19th century to make whetstones for sharpening fine tools; hence its name, Latin *novacula,* sharp knife. Indians used novaculite for weapons and implements. Novaculite has been considered to be metamorphosed chert, replacement by silica of a dolomite or limestone, and a deposit of colloidal silica accumulated on the sea floor.

(A. W. G.)

NOVALICHES, MANUEL PAVIA Y LACY, 1st Marquis de (1814–1896), Spanish marshal, was born at Granada on July 6, 1814. In 1833 lieutenant in the guards of Queen Isabella II, he became general of division during the Carlist war (1833–40). Senator in 1845, war minister in 1847, and marquis in 1848, he went out to Manila in 1852 as captain-general of the Philippine Islands, crushed a formidable insurrection in 1854 and carried out many useful reforms. He commanded the reserves in the Peninsula during the Moroccan war, twice refused the war portfolio offered him by O'Donnell and Narvaez, and when the revolution broke out in September 1868 accepted the command of Queen Isabella's troops. He was defeated by Marshal Serrano at the bridge of Alcolea on September 28, 1868, and was so badly wounded in the face that he remained disfigured for

life. He kept apart during the revolution. The Restoration made him senator, and King Alfonso gave him the Golden Fleece. He died in Madrid on Oct. 22, 1896.

NOVALIS, pseudonym of Friedrich Leopold, Freiherr von Hardenberg (1772–1801), German poet and novelist, one of the pioneers of the Romantic movement, was born on May 2, 1772, on his father's estate at Oberwiederstedt in Prussian Saxony. He studied philosophy at Jena, and law at Leipzig and Wittenberg. At Tennstedt, near Langensalza, he was betrothed to Sophie von Kühn. He became auditor to the salt works at Weissenfels where he heard (1797) of Sophie's death. He expressed his grief in the beautiful *Hymnen an die Nacht,* in which the religious poetry of the Romantics reaches its greatest height. He then entered the Mining Academy at Freiberg, in Saxony, to study under A. G. Werner, whom he immortalized as the "Master" in *Die Lehrlinge in Sais.* In the autumn of 1799 he read to the circle of young Romantic poets at Jena his *Geistliche Lieder.* In 1800 he was appointed local magistrate in Thuringia, and after a short illness he died at Weissenfels on March 25, 1801.

His all too short life did not permit him to blend his mystic and philosophical conceptions into a harmonious whole. His longest work was the unfinished romance, *Heinrich von Ofterdingen;* its hero's search for the mysterious blue flower is an allegory of the poet's life. More popular, however, are his shorter lyrics.

There are editions of the collected works of Novalis by E. Heilborn (3 vols., 1901), and by J. Minor (3 vols., 1907; rep., 1923). His *Briefwechsel* with the Schlegels was edited by J. M. Raich in 1880. *See* also E. Heilborn, *Friedrich von Hardenberg* (1901); T. Carlyle's essay on "Novalis"; Obenauer, *Novalis Gesammelte Studien* (1925); H. Hesse and Isenburg, *Novalis. Documente seines Lebens und Sterbens* (1925).

NOVARA, town and episcopal see, Piedmont, Italy, capital of Novara province, 31 mi. by rail W. of Milan, 538 ft. above sea-level. Pop. (1936) 52,269 (town), 62,570 (commune). Till 1839 circled by Spanish ramparts, Novara is now an open, modern town. The cathedral, except for the octagonal dome-roofed baptistery (10th century), was rebuilt (1863–65); the church of S. Gaudenzio, dedicated to Bishop Gaudentius (d. 417), who is buried under the high altar, rebuilt by Pellegrino Tibaldi about 1570, has a baroque campanile and a dome (1875–78) 396 ft. high. The city also contains handsome market buildings erected in 1817–1842, a large hospital dating from the 9th century and a court-house constructed in 1346. The town has also a museum of Roman antiquities. The principal industry is the carding and spinning of silk; there are also iron-works and foundries, cotton mills, rice-husking mills, organ factories, dye-works, printing and map-making works.

Novara, the ancient *Novaria,* lay on the road between Vercellae and Mediolanum. Its rectangular plan probably survives from Roman days. A dukedom of Novara was constituted by the Lombards, a countship by Charlemagne. In the 12th century it accepted the protection of Milan. In 1706 it was occupied by Savoy troops. At the Peace of Utrecht it passed to Austria with Milan; but was granted to Charles Emmanuel in 1735. Under the French it was the chief town of the department of Agogna. Restored to Savoy in 1814, it was in 1821 the scene of the defeat of the Piedmontese by the Austrians, and in 1849 of the more disastrous battle which led to the abdication of Charles Albert and an Austrian occupation of the city.

Novara was the scene of a battle on March 23, 1849, between the Austrians, 70,000 strong with 182 guns, under Radetsky and King Charles Albert, who led the Sardinian forces, 65,000 men with 140 guns. Chzarnowski, a Pole, virtually directed the army. Armistice, concluded Aug. 9, 1848, was to terminate March 20. Radetsky retreated from Milan on March 17, feigning to retire to Lodi-Cremona, but on reaching San Angiolo he made for Pavia, crossing the Ticino on March 20. Meanwhile Chzarnowski marched on Magenta without encountering the enemy, but here news reached him that the Austrians were at Pavia; thereupon he halted the army and turned it back to Vigevano. Radetsky had advanced so swiftly that Ramorino's Sardinian division south of the Po was cut off, the bridge at Mezzano Corte being destroyed, though it had orders to stand at Cava, threatening the hostile advance. Fighting took place at Mortara on March 21, the Sardinians falling back on Novara; where Chzarnowski decided to await Radetsky. A corps of Austrians approached Novara and engaged the whole Sardinian army on March 23. Seriously outnumbered until reinforcements arrived, the Austrians fought with great tenacity and before the end of the day had driven the Sardinians back in confusion. Charles Albert abdicated that night.

NOVA SCOTIA, a province of Canada, lying between approximately 43° 25′ and 47° 15′ N. and 59° 40′ and 66° 25′ W., and composed of the peninsula proper and the adjoining island of Cape Breton (*q.v.*). The extreme length from southwest to northeast is 376 mi. (N.S. 268, C.B. 108); breadth 60 to 100 mi.; area 21,068 sq.mi. The isthmus of Chignecto, $11\frac{1}{2}$ mi. wide, connects it with the province of New Brunswick.

Geology and Physical Features.—Nova Scotia may be described as an ancient mountain land almost completely worn down. The original folds apparently ran either east or northeast and were complicated by intrusive granite in the country southwest of Halifax. The province forms the eastern portion of a somewhat complex basin, with the youngest Triassic beds in the Annapolis valley. The general disposition of the folds seems to be indicated in the coast and in the lines of higher land, which, however, rarely reach above the 1,000 ft. level, save in the Cobequid hills, which rise to a few feet above this figure. They occupy the neck between New Brunswick and Nova Scotia, and represent the axis of a fold. The Chignecto bay to the northwest, and the Minas basin and Cobequid bay to the south, indicate by their directions the divergence of the old worn folds of Nova Scotia on the one hand, and of St. John, N.B., on the other. Around the southeast of the Bay of Fundy are horizontal Triassic deposits including volcanic elements, which give rise to a precipitous coast from Brier Island to Cape Split. The western railway of Nova Scotia runs on low ground between this structural feature and the main mountain fold-axis farther southeast. This feature is broken at Digby Gut, and a portion of the lowland within it is submerged as the long Annapolis basin (called the garden of Nova Scotia).

One of the last geological changes has been a land-sinking, which has given rise to the remarkable succession of cliff-fringed rias, with islands offset along the Atlantic coast, Halifax harbour being the most famous of these. The north shore is, as a rule, low, and Pictou has its chief harbour.

Cape Breton Island is essentially a continuation across the narrow strait of Canso. The granitic northern plateau is rugged and barren, and is devoid of settlement. The coasts of the province are famous for their tides. Though they rarely exceed 8 ft. at Halifax, they average 42.3 ft. in the Bay of Fundy, and 53 ft. at the top of the funnel in Cobequid bay.

Climate.—The maritime influences are more marked in this province than in New Brunswick (*q.v.*). The temperatures at Halifax range from 23° F. in January to 65° in July. The average rainfall is between 40 and 45 in., except along the southern coast, where it is nearly 10 in. greater. The winter snowfall is about 80 in.

History.—Nova Scotia may well have been the Markland of early Norse and Icelandic voyages, and Cape Breton was visited by the Cabots in 1497–98, but not till 1604 was any attempt at permanent colonization made by Europeans. In that year an expedition was headed by a Frenchman, Pierre du Guast, Sieur de Monts (1560–*c.* 1630), who had received from Henry IV full powers to explore and take possession of all lands in North America lying between the 40th and 46th parallels of north latitude. De Monts and his friend de Poutrincourt (d. 1615), endeavoured to form settlements at Port Royal (now Annapolis), St. Croix (in New Brunswick) and elsewhere, but quarrels broke out with the Jesuits, and in 1613 the English colonists of Virginia invaded the settlement and expelled the greater part of the inhabitants. In 1621 Sir William Alexander obtained from James I a grant of the whole peninsula, which was named in the patent, Nova Scotia, instead of Acadia, the old name given to the colony by the French. During the reign of Charles I the still existing order of baronets of Nova Scotia was instituted, and their patents ratified in parliament. The Treaty of St. Germain-en-Laye (1632) confirmed France in the possession of Acadia, Cape Breton and New France;

but fierce feuds broke out among the French settlers, and in 1654 a force sent out by Cromwell took possession of the country, but by the Treaty of Breda (1667) it was restored to France by Charles II. Continual fighting went on between the French and the British colonists of New England, the Indians taking part, usually on the side of the French; in 1710 the province was finally captured by Great Britain and ceded to it in 1713 by the Treaty of Utrecht, under the name of "Acadia or Nova Scotia," the French remaining masters of Cape Breton. In 1749 Halifax was founded as a counterpoise to Louisburg in Cape Breton, and more than 4,000 colonists were sent out.

Shortly after the foundation of Halifax occurred that expulsion of the Acadians in 1755 which remains, not in magnitude but in significance, one of the great episodes of American history, celebrated afterward in Longfellow's *Evangeline*. About 3,000 Acadians were removed from their settlements on Minas basin and elsewhere, and transferred, with no compensation for property or livestock, to various American colonies. Those who found their way back later on made new homes mostly in New Brunswick. The plea of the British government was that since the Treaty of Utrecht these Acadians had a status rendered impossible by recurrent war with France.

In 1758 the province of Nova Scotia was accorded an elective representative assembly in view of a decision of the British law officers that this was an inherent privilege of British settlers overseas. The precedent has remained of great importance. During the American Revolutionary War a large number of Negroes were set free by British armed forces and transported as free men to Nova Scotia. These, with freed Negroes from Jamaica, originated the Negro population of today. In 1769 Prince Edward Island (formerly Isle St. Jean) was made a separate government. An influx of American loyalists led in 1784 to the erection of New Brunswick into a separate colony.

During the wars of the American and French revolutions Halifax grew apace. Between 1784 and 1828 a large Scottish emigration, chiefly from the Highlands, had settled in the counties around Pictou, and the lumbering industry rose to great proportions. Agriculture was neglected, but in 1818 the letters of "Agricola" (John Young, 1773–1837) gave it an impetus.

After peace in 1815, the middle 19th century witnessed a great economic advance in Nova Scotia due to the fisheries, the timber trade and the building of wooden ships. Nova Scotia shipbuilding seemed (1846) to be conquering the world, with 2,583 vessels as compared with 605 for Canada, representing one-third as much tonnage as that of France. But political life lagged behind owing to the peculiar privileges of a small official class and the Anglican Church. Hence there was a movement for reform by responsible government, as in upper Canada, led by Joseph Howe, whose "twelve resolutions" of 1836 became the platform of reform. Refused for years, responsible government (1848) came painlessly as a result of its institution in Canada. The political struggle was interwoven with an agitation for free secular education (1864) and for reorganizing Dalhousie university on a secular basis. Charles Tupper (Sir Charles, 1873) of Amherst, Conservative, and "Joe" Howe, Liberal, were the great protagonists of the province at this period. Tupper's influence carried confederation (1867) but only by a legislative, not a popular, vote. The province was rent by the subsequent agitation for repeal, weakened by Howe's defection (1869) (to enter the federal cabinet), but never lost from Nova Scotia politics. In the middle '80s it took the form of secession into a maritime union, sponsored by W. S. Fielding as the platform of election in 1886 and carried by a legislative vote of 2 to 1. The imperial government joined the Canadian federal government in getting "better terms" for the maritime provinces, but opposed secession.

Nova Scotia had prospered greatly between 1855 and confederation as the result of British trade and the reciprocity treaty (1854) with the United States. The abrogation of the reciprocity in 1866 and the embrace of the Canadian tariff on manufactures after 1867 were followed by a change of fortune alleviated only by the war-created booms of 1914–18 and 1939–45. Politics in the 20th century have largely turned on this unsatisfactory economic status in spite of the changes effected by the steel and coal industries, by local manufactures and by the construction of the railway systems and the development of Halifax (along with St. John, N.B.) as Canadian winter ports. In the period between World Wars I and II, attention continued to be turned on economic relations with central Canada, the subject of various investigations and reports. Two royal commissions (Duncan commission, 1926; Jones commission, 1934) investigated and reported in favour of better "terms" for the province.

Area and Population.—The area of the province is 21,068 sq.mi. of which 20,743 are land and 325 water. The population (1951) was 642,584. At the census after confederation (1871) it stood at 387,800. The great majority of the people, more than 75%, are of British race, either direct or through American loyalists. The Acadian French, including nearly 7,000 in Cape Breton Island, constitute about 11%.

Government and Public Finance.—The government of Nova Scotia is based on the (imperial) British North America Act of 1867 and its amendments, together with all preconfederation institutions, including the common law, except as altered or abolished by confederation itself or later imperial statutes. The act provided representation in the senate (12 members 1867–72; 10, 1873–1951) and a membership in the house of commons at Ottawa adjusted according to population after each census (10 in elections of 1949), and distributed federal and provincial powers. The administration of Nova Scotia consists of a lieutenant-governor, appointed and paid by the federal government, and by custom a resident of the province; a premier and cabinet on the recognized constitutional model and a nonpolitical civil service: the judges are appointed by the federal government. There is a legislative assembly sitting at the capital, Halifax, 37 members elected for five years unless sooner dissolved. Municipal government in Nova Scotia, as in all the maritime provinces, is less developed than in central Canada. In 1951 there were in Nova Scotia 24 rural municipalities of which 12 were counties and 12 represented 6 divided counties. With these were two incorporated cities, Halifax (84,433) and Sydney (31,207) and 41 incorporated towns. The provincial revenue of Nova Scotia was $525,000 in 1871 and $38,798,000 gross in 1947.

Education.—Primary public education is compulsory, free of charge and nondenominational. Ordinary day schools of this character in 1948 had an enrolment of 124,128 pupils (average daily attendance 103,858) as compared with 3,414 in denominational and private schools and 1,011 in "business colleges." The number of teachers in public schools (1948) was 3,958 of whom 2,150 received salaries ranging from $525 to $1,024 a year. The universities of the province include King's college, Anglican, established at Windsor, N.S., in 1790 but after 1923 amalgamated with Dalhousie university for all subjects except divinity; Dalhousie university, Halifax, established in 1818; St. François Xavier, Antigonish, Roman Catholic (1866); and Acadia university, Wolfville, Baptist (1839).

Commerce and Manufactures.—Nova Scotia is naturally a seagoing province, and till about 1881 had the largest tonnage, in proportion to population, in the world. Halifax is still one of the chief winter ports of Canada, and Sydney is also a favourite port of call for steamers in need of "bunker" coal. The water power provided by the rivers supports many manufactures. Several sugar refineries exist.

The fisheries of Nova Scotia are the next most important in Canada, after those of British Columbia. Lobsters, cod, mackerel, herring and haddock constitute the bulk of the catch. Many boats are fitted out in Lunenburg, Digby, Yarmouth and other ports for the Grand Banks of Newfoundland. A large number are employed in the lobster canneries and other kindred industries. Trout and salmon abound in the lakes and streams.

The classified returns of 1947 showed the manufactures of Nova Scotia as having 30,285 employees, of whom 4,340 were in the iron and steel industry, 3,996 in sawmills, 3,441 in fish curing and packing, 3,024 in shipbuilding and repair, 1,043 in textiles, and the rest in 12 other major industrial groups. The 1947 gross value of all industrial products was $204,219,433.

Lumber.—Lumbering was long the chief industry of the province, and is still very important, though the 1950 estimated stand of accessible raw material was 6,110,000,000 ft. b.m. (242,072,000,000 for all of Canada). In 1948 the cut was 319,403,000 ft. b.m. The network of small lakes and rivers enables the logs to be brought to the mills with great ease, and little rough timber is now exported. The chief

trees include spruce, fir, pine, birch, oak and maple. The manufacture of wood pulp for paper is also carried on.

Minerals.—Bituminous coal is mined in various parts of Cape Breton (*q.v.*) and in the counties of Cumberland and Pictou. The seams dip at a low angle, and are of great thickness, especially in Pictou county. The known coal fields cover about 1,000 sq.mi. Other important centres are Springhill, Acadia mines, Stellarton and Glace Bay (C.B.). It is shipped as far west as Montreal, and to the New England states of the U.S. The by-product industries are very important. Iron was mined from 1876 to 1913, with a peak of 102,201 tons in 1893. Iron ore for the large blast furnaces at New Glasgow, Sydney and North Sydney is now imported from Newfoundland. There are quarries of easily worked limestone, the product of which is used as a "flux" in the blast furnaces. Some gold has been produced every year since 1862, rising to a peak of 29,943 oz. in 1939 but falling to 64 oz. in 1949. Large deposits of gypsum occur, especially at Windsor, in Hants county. Manganese and copper are worked on a small scale. In 1949, 97% of the barite produced in Canada came from Nova Scotia.

Statistics of mineral production for 1949 showed a total value of $56,093,000, with coal at $47,998,000. Gypsum stood at 2,556,000 tons, which was 84% of Canadian production.

Agriculture.—The attention paid to lumbering, fishing and shipping, and the subsequent emigration westward have lessened the importance of this industry. Mixed farming is, however, largely carried on, and dairy farming has been greatly extended. Nova Scotia is specially famous for its fruits, the export of apples being the main feature. The centre of this industry is the valley of Annapolis. At the head of the Bay of Fundy and on Minas basin the low-lying meadows produce splendid crops of hay and good pasture, while the cool climate and moisture make the region well suited for dairy farming and stock raising.

Statistics show the total agricultural land of Nova Scotia, actual and available, as 12,640 sq.mi. or 60.9% of the land area of the province. Of this area 2,412 sq.mi. was represented in 1950 by farm lands and unimproved pasture; 3,551 sq.mi. was occupied but unimproved woodland; 6,677 sq.mi. was unoccupied grass and brush land with agriculture possibilities. The rest of the land area is productive forest.

Communications.—The geography of Nova Scotia and the great number of harbours make communication by sea a principal feature. The Canadian National railways connects with Halifax via Moncton and Truro with a branch to Sydney. The Canadian Pacific connects from St. John, N.B., via steamer ferry to Digby and to Halifax and also westward to Yarmouth. The total railway mileage in 1951 was 1,396. The province had 15,143 mi. of motor roads in 1948, of which 1,109 were bituminized. The Trans-Canada Airlines air mail and passenger service was extended from Montreal to Moncton, N.B., in 1940 and in the same year from Moncton to Halifax. Telegraph and telephone connections extend throughout the province with Atlantic cables at Canso and Sydney.

Environment and Settlement.—The control of the distribution of population by the geological features is quite marked in Nova Scotia. The oldest rocks as usual are found to be the least favourable for close settlement. The plateau (built of Pre-Cambrian granite for the most part) in the north of Cape Breton Island stands well above 1,000 ft., and is almost uninhabited. The granites of the Cobequid hills and to the east of Annapolis Royal, though barely reaching 1,000 ft., are also empty. The ancient Cambrian and Devonian sandstones along the coast to the north and south of Halifax are sparsely occupied by small dairy farms. There is, however, a fairly close settlement of fishermen, as well as the large population clustered at Halifax.

The younger formations are the Carboniferous in the northeast, the Permian on the isthmus of Chignecto, and the Triassic along the east side of the Bay of Fundy. The Carboniferous and Permian contain the very valuable coal fields of Sydney, Inverness, Stellarton, and Joggins; while the Triassic produce the soils devoted to the best apple culture in Canada. Oats and dairy cattle are grown on these younger formations, especially on the red sandstones of Permian Age to the north of the Cobequid hills.

(S. Lea.; C. Cy.)

NOVATIANUS, Roman presbyter, and one of the earliest antipopes, founder of the sect of the Novatiani or Novatians, was born about the beginning of the 3rd century. On the authority of Philostorgius (*H.E.* viii. 15) he has been called a native of Phrygia. He was ordained at Rome by Fabian, or perhaps by an earlier bishop; and during the Decian persecution he maintained the view which excluded from ecclesiastical communion all those (lapsi) who after baptism had sacrificed to idols—a view which had frequently found expression, and had caused the schism of Hippolytus. Bishop Fabian suffered martyrdom in January 250, and, when Cornelius was elected his successor in March or April 251, Novatian objected on account of his known laxity on the above-mentioned point of discipline, and allowed himself to be consecrated bishop by the minority who shared his views. He and his followers were excommunicated by the synod held at Rome in October of the same year. He is said by Socrates (*H.E.* iv. 28) to have suffered martyrdom under Valerian. Novatian has been confused with Novatus, a Carthaginian presbyter, who held similar views.

Novatian was the first Roman Christian who wrote to any considerable extent in Latin. Of his numerous writings three are extant: (1) a letter written in the name of the Roman clergy to Cyprian in 250; (2) a treatise in thirty-one chapters, *De trinitate;* (3) a letter written at the request of the Roman laity, *De cibis judaicis.* They are well-arranged compositions, written in an elegant and vigorous style. The best editions are by Welchman (Oxford, 1724) and by Jackson (London, 1728); they are translated in vol. ii. of Cyprian's works in the *Ante-Nicene Theol. Libr.* (Edinburgh, 1869). The Novatian controversy can be advantageously studied in the *Epistles* of Cyprian.

NOVATION, a legal term derived from the Roman law, in which *novatio* was of three kinds—substitution of a new debtor, of a new creditor, or a new contract. In English law the term (though it occurs as early as Bracton) is scarcely naturalized; substitution of a new debtor or creditor being generally called an assignment. A new contract either tacitly or expressly operates as a release from the original contract. Where the substituted contract is one of a higher nature, as where a contract under seal supersedes a simple contract, it is called a merger. The extinction of the previous contract is held to be sufficient consideration. The particular points on which novation turns are whether the new firm or company has assumed the liability of the old, and whether the creditor has consented to accept the liability of the new debtors and discharge the old. The question is one of fact in each case. (*See* especially the Life Assurance Companies' Act, 1872, s. 7, where the word, "novations" occurs in the marginal note to the section, and so has quasi-statutory sanction.) Scots law seems to be more stringent than English law in the application of the doctrine of novation, and to need stronger evidence of the creditor's consent to the transfer of liability. In American law, as in English, the term is something of a novelty. In Louisiana, and generally in systems much influenced by Roman law, novation forms a more specific department of the law of contract (*q.v.*).

NOVAYA ZEMLYA. An Arctic land off the coast of European Russia, to which it belongs, consists of two large islands separated by a narrow winding channel 56 mi. long, the Matochkin Shar. It lies between 70° 31′ and 77° N., and between 51° 35′ and 69° 2′ E. and forms an elongated crescent, being nearly 600 mi. long with a width of 30 to 90 mi., and an area of about 30,000 sq.mi. It separates the Barents sea on the west from the Kara sea on the east. With Vaigach island 30 mi. to the south, and the mainland, Novaya Zemlya forms a continuation of the Pai-Khoi hills, a branch of the Ural folds.

The greatest heights occur in the neck of the south islands where near Matochkin Shar are altitudes of about 4,000 ft. In the middle part of the south island there are few elevations over 1,400 ft., but in the south the summits rise to over 2,000 ft. The north island seldom rises to greater altitudes than 3,000 ft.

Geology.—A central zone of upper Cambrian and Devonian rocks extends along the islands. These quartzites, conglomerates and dolomites are flanked by carboniferous shales and limestones. The minerals of value are some lignite and a little copper ore.

Climate.—Novaya Zemlya is colder than Spitsbergen (which lies more to the north) as in some degree it shares in the continental conditions of northern Russia and Siberia. The middle and northern parts of the west coast are not so cold as the east. Temperatures at Karmakul are 2·3° F. (Feb.) and 43·2° (July). Snow is universal from October to May.

Flora and Fauna.—Vegetation is solely tundra and decreases from south to north. It is most luxuriant in Gooseland on the southwest. There are no trees or bushes. The flowering plants number 187.

In the ice-free areas there are foxes, lemmings, bears, reindeer and an occasional wolf. Insects are numerous near the coast. Countless birds come from the south for the breeding season, and at certain parts of the seacoast the rocks are covered with

millions of guillemots, while great flocks of ducks of various sorts, geese and swans swarm every summer on the valleys and lakes of the south. Whales, walruses and various seals are frequently seen. The goltzy occurs in the rivers.

The numbers of sea mammals and birds attracted Russian hunters, and even in the 16th century they had extended their huts (*stanovishtcha*) to the extreme north of the island. Many of them wintered for years on Novaya Zemlya. Because of the ice in the White sea Russian hunters found Novaya Zemlya less easy of access than did the Norwegians. But about 1877 systematic attempts at settlement were begun by the Russian government, several families of Samoyedes being established at stations on the west coast of the south island, including Karmakul on Moller bay, Pomorskaya bay and Byeloshya bay. There is a Russian observatory on Matochkin Shar.

History.—Novaya Zemlya was probably known to Novgorod hunters in the 11th century and to Norse hunters a century earlier. In 1553 Sir Hugh Willoughby may have sighted Gooseland. In 1556 Stephen Borough reached the south extremity of the Novaya Zemlya, being the first western European to do so. Willem Barents touched the island (1594) at Sukhoi Nos (73° 46′) and followed the coast north to the Orange Islands and south to the Kostin Shar. In 1596, after his discovery of Spitsbergen, Barents wintered at Ice haven in 76° 12′ N. (*see* ARCTIC REGIONS). Rumours of silver ore led the Russian government to send out expeditions. In 1760 Savva Loshkin cruised along the east coast, spent two winters there, and in the next year returned along the west coast, thus accomplishing the first circumnavigation; but the records of his voyage have been lost. In 1768 Lieut. Rozmyslov explored Matochkin Shar, where he spent the winter. The first scientific information about the island is attributable to the expeditions (1821–24) of Lütke (1797–1882), after whom part of the north island is named Lütkeland. Nearly all the west coast as far as Cape Nassau, as well as Matochkin Shar, was mapped and valuable scientific information obtained. In 1832 and 1835 Lieut. Pakhtusov mapped the east coast as far as 74° 24′. The work of Karl von Baer in 1837 was untrustworthy. In 1870 the Norwegian Capt. L. E. H. Johannesen accomplished the second circumnavigation of Novaya Zemlya, and in 1871 E. Carlsen found Barents' winter hut. In 1878 M. Grinevetskiy crossed the south island. Among later expeditions may be mentioned those of C. Nossilov (1887–92), T. N. Chernychev (1895), who made a crossing of the south island, H. J. Pearson (1895 and 1897), A. A. Borisov (1899 and 1900), O. Ekstam (1900 and 1903), W. Russanov (1908), who crossed the south of the island, Pavlov and Weise (1912) of the Sedov expedition, who crossed the north island (*see* ARCTIC), as did O. Holtedahl (1921). P. V. Vittenburg explored the south island in 1925.

BIBLIOGRAPHY.—Most work is in Russian. *See* H. J. Pearson, *Beyond Petsora Eastward,* with botanical and geological appendixes by H. W. Feilden (London, 1899); J. Spörer, *Nowaja Semlja* (Gotha, 1867); A. P. Engelhardt, *A Russian Province of the North* (Archangel, of which the author was governor), translated by H. Cooke (London, 1899); and O. Holtedahl, *Report of the Scientific Results of the Norwegian Expedition to Novaya Zemlya, 1921* (Oslo, 1924).

(R. N. R.-B.)

NOVEL, a written prose fiction. The term, in English, is very loosely used and is being constantly modified to include new experiments in fictional writing. The word first came into common use in English in the 18th century, gradually superseding the term "romance." But the distinction between the two has never been precise. The generic term "romance," however, included work not in prose, whereas the word novel has never been applied (except for a very few specific "novels in verse") to any but prose writing, though the style and texture of the prose has varied from the plain and "factual" to the complex and "poetic." If there is good ground for emphasizing a written prose as the accepted medium of the novelist, the fictional nature of the novel raises more complex problems, for, particularly in the early novel, the dividing line between fact and fiction is not always clear. Nor is it possible to dogmatize on the question of length. William Congreve's *Incognita* runs to little more than 20,000 words, as opposed to the 4,000 pages of Marcel Proust's *A la Recherche du temps perdu;* yet both are called novels. Many early novelists seem to have thought of the novel as more realistic, less fanciful, than the romance, which had in their minds an escapist connotation, generally associated with aristocratic values and attitudes, in particular the chivalric and pastoral traditions. The 18th-century novel was in general an attempt to replace the aristocratic romance by a literature more in keeping with the views of reality and morality of the middle class, or, at least, of a society in which the middle class played an increasingly important part. The modern novel was something new in literature and yet owed debts to many previous traditions: to the prose stories of classical Greece and Rome (*e.g.,* Longus, *Daphnis and Chloe;* Apuleius, *The Golden Ass;* Petronius, *The Satyricon*); to spoken prose epics (*e.g.,* the sagas of the Icelanders); to the parables and allegories of the mediaeval pulpit; to the Bible (*e.g.,* the books of Ruth, Job and Esther); to the mediaeval prose romance (*e.g.,* Sir Thomas Malory, *Morte d'Arthur*); to the chroniclers and early historians; as well as to a great deal of verse (*e.g.,* Chaucer). It is with François Rabelais's *Gargantua and Pantagruel,* with the Spanish picaresque stories and the Italian *novelle* of the 16th century, and above all with Cervantes' *Don Quixote* that the modern novel begins.

THE ENGLISH NOVEL

Growth of the Form.—Elizabethan fiction falls largely into two categories: the aristocratic and the plebeian. Examples of the aristocratic or courtly genre, developing from the chivalric and pastoral stories of the middle ages and antiquity and stimulated particularly by the development of the Italian *novella,* can be seen in the *Euphues* of John Lyly, the *Arcadia* of Sir Philip Sidney and a host of smaller works such as Thomas Lodge's *Rosalind,* on which Shakespeare based *As You Like It.* In these stories a sophisticated verbal artifice is combined with open didacticism and highly conventionalized plots in which idealized characters speak and occasionally act. The tone is aristocratic and sophisticated, presupposing an audience to whom the conventions and values of feudal society and literature are altogether acceptable. Although the implications of these books are occasionally, as in the case of the *Arcadia,* profound, they possess little if any psychological or social realism. The word "courtly" best conveys their tone and function. This courtly fiction continued to be produced in a more or less modified form throughout the 17th century. The tradition changes and finally becomes almost unrecognizable as the feudal world itself gradually disappears. Emanuel Ford's *Ornatus and Artesia* (1595?) is in the tradition, still fairly pure; while the stories of Aphra Behn (1640–89) form the link between the courtly romance and the 18th-century novel. The tone and assumptions remain aristocratic, but there is more action and plot, more social observation, more interest (though little realism) in personal psychology and emotion.

The second category of Elizabethan fiction, very much smaller in volume yet more significant as a developing force, is the plebeian element. Here the influence of the Spanish picaresque novel is paramount, though it was no mere formal literary influence, rather a common response to a comparable social and intellectual situation. Thomas Nashe's *The Unfortunate Traveller* (1594) and Thomas Deloney's *Jack of Newbury* (1597)—plebeian but not picaresque—express a sensibility quite different from that of the courtly writers. Jack Wilton, the hero of Nashe's story, is in spirit a sheer *picarò* (rogue), an outcast of feudal society, respecting none of its sanctities. His story, violent, ill-organized, racy, episodic, ununified, sensational, is in content and hence in form quite different from that of a courtly hero. In place of a chivalric moral code there is a crude and often cynical individualism; in place of a refined sophistication there is irreverence and vigour; realistic detail and a journalistic interest in the contemporary scene are in contrast to the polite and conventionalized forms of aristocratic literature.

From Nashe to Defoe (they were both journalists and pamphleteers, both middle-class writers) there is a direct line; *Moll Flanders* (1722) has most of the characteristics of the picaresque novel. But between Nashe and Defoe there is the century of the Civil War, during which the middle class became ever more power-

ful, ever more self-conscious. Between Nashe and Defoe there took place the rise of Puritanism (note Defoe's determination to be at all costs what Nashe never was, respectable). And in the history of literature, between Nashe and Defoe in the plebeian tradition, there stands John Bunyan, inheritor of the allegorical tradition of the middle ages but deeply, militantly antiaristocratic, antifeudal, forging a Puritan style, biblical and yet colloquial, producing a moral fable of enormous popular, traditional power and profound psychological and moral realism.

The 18th-century novel has behind it, then, at least two lines contributing to its immediate development: the aristocratic line against which the middle-class writers are in reaction (as Cervantes attacked the romances of chivalry) but which contributes nevertheless to their work, and the plebeian line with its more vigorous realism and its deepening tinge of Puritan morality.

The 18th Century.—Daniel Defoe (*c.* 1659–1731), Samuel Richardson (1689–1761) and Henry Fielding (1707–54) are the three great figures of the 18th-century novel. Taken by and large the most significant quality of their work is a degree of realism, social and psychological, previously unknown in English prose fiction. All three are much concerned with moral problems, and both Defoe and Richardson affect to regard the didactic element in their work as the most important. In fact Defoe's great contribution lies in the remarkable verisimilitude of the imaginative world he creates, his power to describe with the utmost vividness any form of material activity, and the psychological acuteness of his character portrayal. Richardson, whose *Pamela, Clarissa* (1747–48) and *Sir Charles Grandison* achieved an enormous vogue on the continent as well as in Great Britain, vastly extended the sphere of the novel in the direction of analysis of individual feeling. His long novels, in letter form, probe deep into the emotions and psychology of his characters and reveal with an intense power the situation of women in 18th-century middle-class society. Richardson's conscious moral standpoint is superficial if not worse, and his determination to wring from every situation "the tribute of a tear" is also unsympathetic to modern readers. But *Clarissa,* in particular, is a work of great intensity, dramatizing its tragic theme in a way which closely involves the emotions of even the sceptical reader. Fielding, the literary and moral opponent of Richardson (his *Joseph Andrews* is, among other things, an anti-*Pamela*), was the conscious disciple of Cervantes. An epic sense, an extremely acute critical eye and an urbane manner combine to produce what he defined as a "comic epic poem in prose." The involvement of the reader is far less intense and close than in the case of Richardson's novels, the technique being what Percy Lubbock has described as "panoramic." The plot (not in itself of the deepest interest) and the characters (seldom closely analyzed) are presented within a "haze of reflectiveness," the total effect being a broad critical survey of social life and morality.

From the middle of the 18th century the popularity of the novel steadily increased. The growth of a middle-class reading public (predominantly female) and the introduction of circulating libraries were the basis of this popularity. But, despite the brilliant exception like Laurence Sterne's *Tristram Shandy* (1759–67), a book which is far more than the idiosyncratic game of a garrulous eccentric, the art of the novel can scarcely be said to have progressed in the latter half of the 18th century. Tobias Smollett (1721–71), a writer of the greatest vigour, added memorably to the group of novels in the picaresque tradition but scarcely modified that tradition. Neither Samuel Johnson's *Rasselas* (1759) nor Oliver Goldsmith's *The Vicar of Wakefield* (1766), for all their qualities, can be said to extend the realm of the novel. The form was indeed not yet taken quite seriously by most critics, and the average novel—whether in the sentimental genre or of the Gothic variety (popularized above all by Ann Radcliffe, 1764–1823)—involved little more than the titillation of the sensations of its readers.

With Sir Walter Scott (1771–1832) and Jane Austen (1775–1817) new developments take place. It is, above all, the sweep of a historical sense that Scott brings to the novel. His stories embody a great sense of change and movement as well as a deep feeling for the national traditions and aspirations of the Lowland Scots. He took the old Gothic novel and by putting new content into it fundamentally modified the form. Jane Austen's contribution, on the other hand, lies in her transformation of the sentimental domestic novel of Fanny Burney and her predecessors. There is an extraordinary concreteness and intensity in her examination of a small social area. She is the least allegorical of novelists, the least concerned to capture the vaster pattern of human experience. But by presenting the reader with a world defined and analyzed to its minutest detail she is able to examine the precise quality of personal relationships. Her world and values are secure and in one sense narrow, but within these limitations her realism is complete.

The Victorians.—The Victorian novel, so widely read and influential in its numerous repercussions, seemed to many later critics insufficiently "adult." "As for our novel," wrote Henry James in 1888, ". . . as we find it in England today it strikes me as addressed in a large degree to 'young people,' and that this in itself constitutes a presumption that it will be rather shy." Closely connected with this accusation of moral inadequacy is the sense of a somewhat lackadaisical artistic concern, a feeling that the 19th-century novel is amorphous and undisciplined, not self-conscious enough. Certainly from Jane Austen to James there was little tendency to regard the novel as an "art form." Edmund Gosse could say, "The novel has been made the vehicle for satire, for instruction, for political and religious information; but these are side issues. Its plain and direct purpose is to amuse by a succession of scenes painted from nature, and by a thread of emotional narrative." Serial publication, with its emphasis on "what happened next," no doubt encouraged this view of the novel (often a "three-decker" with final issue in three parts).

Yet it would be quite inadequate to see the work of the Victorian masters—Charles Dickens (1812–70), William Makepeace Thackeray (1811–63), Charlotte (1816–55) and Emily Brontë (1818–48), George Eliot (1819–80), George Meredith (1828–1909)—simply as rather loosely woven stories bound together by no overall artistic unity. These writers were not much given to theorizing on the art of the novel but in practice they extended its scope. Dickens, perhaps the most remarkable genius in the history of English prose fiction, absorbed into his work many popular forms and traditions and achieved effects of unexampled vitality and power. Besides its richness of atmosphere and comic observation of character, his work has at its best a symbolic quality most often associated with poetic drama. In this it is allied with Emily Brontë's *Wuthering Heights* (1847), the greatest single achievement of the 19th-century novel, a work which penetrates with a Shakespearean profundity the deepest issues of life and death. Jane Austen's method was continued, though within a far wider frame of reference, by George Eliot, a writer of the greatest intelligence, compassion and moral acumen, whose *Middlemarch* (1871–72) was perhaps the masterpiece of mid-Victorian fiction.

A schematic analysis of the various types of 19th-century novel might distinguish (without attempting to pigeonhole each novel) between a number of approaches and methods: (1) the panoramic method in which the author assumes a puppetmaster role and in which the reader observes rather than shares the experiences of the characters (*e.g.,* Thackeray's *Vanity Fair*); (2) the symbolic method in which a host of significance is concentrated into certain intensely presented images and conflicts (*e.g., Wuthering Heights*); (3) the "scenic" method (the adjective is Percy Lubbock's) in which, against a very closely defined background, specific personal relationships and moral conflicts are revealed and discussed (*e.g., Middlemarch* and, on a somewhat lower level, the novels of Anthony Trollope); (4) the moral fable, in which the plot and particular incidents retain for the reader the sense of illustrating an originally abstract concept (*e.g.,* Benjamin Disraeli's *Sybil*); (5) the adventure story, in which incidents are related and suspense achieved for their own sake and little or no "criticism of life" is implied (*e.g.,* Wilkie Collins' *The Moonstone,* Robert Louis Stevenson's *Kidnapped*); (6) the sentimental novel which merely plays on and indulges the moral and emotional prejudices of the reader (*e.g.,* Mrs. Henry Wood's *East Lynne*).

Rise of the Modern Novel.—It is toward the end of the 19th century, partly through the influence of the French and particularly

in the work of Henry James, that a really self-conscious attitude to the novel as an art form develops. The growth in self-consciousness is accompanied by significant changes in the relationship of the author to the public. Scott, Dickens, Thackeray, even George Eliot had been "popular" writers, read by a very wide section of the community; the development of their sensibility was not such as to tend to alienate them from the mass of the reading public. But from the time of Henry James a division between the "good" or "high-brow" or "adult" on the one hand and the "popular" on the other becomes one of the dominant features in the development of the novel, as of other branches of literature. Only perhaps by Thomas Hardy and Joseph Conrad has the gulf been fairly firmly bridged, although Hardy's reputation has not been unchallenged by the more sophisticated critics.

To no previous novelist had the ramifications involved in the fictional presentation of any situation seemed so widespread and so subtle as to Henry James (1843–1916), born in the United States but attaching himself more and more throughout his life to Great Britain. This "historian of fine consciences" aimed at the revelation of situations whose moral significance could be fully expressed and apprehended by a sensibility sharpened to the highest, most exquisite point of refinement. Such an attempt involved him in the development of a prose style, in his later books, of enormous complexity. It is as though he can never bear to leave a sentence without a further oblique modification. The critical question in an appraisal of James's achievement is whether the sensibility may not be idealized to a point at which its relation with the necessities of social reality is lost.

Equally conscious of the problems of presentation was Joseph Conrad (1857–1924), a Pole who wrote his novels in English. In his books, which span the earth in their scenes and subject matter and have sometimes a misleadingly "adventure story" surface, are to be found many of the typical themes of 20th-century fiction: a background of violence and frequently horror, an insistence with the extremes of moral and political dilemma, a sense of the constant perilousness of a man's life and decisions; but also—far more rare in 20th-century literature—an epic confidence in human heroism.

Thomas Hardy (1840–1928), technically far less experimental, produced meanwhile his novels of the rural life of southern England. In his capacity to set his characters deep in their natural surroundings, his evocation of the very texture of country life and, above all, in his sympathy for the plight of the vanishing peasantry, Hardy's later novels are the furthest extreme from the pastoral romance and involve a profound and candid if unsophisticated facing of some of the underlying moral issues of society.

Rejecting any kind of narrow aestheticism, D. H. Lawrence (1885–1930) proclaimed "To be alive, to be man alive, to be whole man alive: that is the point. . . . The novel is the book of life." It was the kind of all-embracing claim made also for the novel by H. G. Wells, a writer who turned out to be less successful in combining teaching and art. To Lawrence the quality of life could not be conveyed without an attempt to catch the rhythms and conflicts of the unconscious mind. In his books personal relationships are dramatized at a level which previous novelists had scarcely attempted. Obsessive and perhaps overintense as his stories tend to be, and failing as they often do to achieve a complete artistic unity, the formal modifications and experiments he made in the course of expressing his vision have the significance of the work of a remarkable genius.

In the 1920s especially came a thoroughgoing reaction against the naturalistic methods of many late Victorian and Edwardian novelists, of whom Arnold Bennett (1867–1931) and John Galsworthy (1867–1933) were perhaps the most considerable and widely read. Virginia Woolf's essays on modern fiction are landmarks in this reaction, formulating a growing dissatisfaction with a fictional method from which it seemed that, despite a formidable verisimilitude and technical competence, "life escapes." The novels of Virginia Woolf herself (1882–1941), with their change of emphasis from plot and objective narrative to a sensuous apprehension of the texture of the lived moment, form a part of the new tendency, as does the work of Dorothy Richardson (1882– ; the first English writer to try to develop fully a "stream of consciousness" technique) and—in somewhat different directions—that of E. M. Forster (1879–) and James Joyce (1882–1941). No work in the history of the English novel has exploited more remarkably every resource of language than Joyce's *Ulysses* (1922), an enormously elaborate imposition of a frequently almost unrecognizable Homeric theme on an evocation of a day's life in Dublin. To many it has seemed that the experiments of the 1920s, culminating in Joyce's *Finnegans Wake* (1939), gave to the novel new dimensions and potentialities; to others the 20th-century novel has seemed to find itself in a cul-de-sac of inward-turning individualism. It is difficult to isolate the possible long-term value of the technical experiments of 20th-century novelists from the limitations which their views of life seem often to impose upon the total effect of their work. It has become, overwhelmingly, the most widespread and influential form of literature produced in the 20th century. The great majority of novels, however, can scarcely be regarded as serious works of art or indeed as serious contributions to literature of any kind; they are, rather, the market products of a highly commercialized industry. The future of the novel would seem to depend on the ability of the novelists, and perhaps society in general, to break down the separation that has arisen between the good and the popular. (AD. C. K.)

THE EUROPEAN NOVEL

France.—In France, storytelling goes back to the earliest *chansons de geste* (late 11th century); love as a main theme appeared in the Tristan legend, which also combines magic with high adventure; Chrétien de Troyes's Arthurian romances (*c.* 1160–80) added skilful analysis of motive and sentiment. The *Roman de la Rose* (first part *c.* 1230) developed allegorical presentation, and this, together with idealized sentiment derived from *Aucassin et Nicolette* and idyllic settings taken from the *pastourelle*, established an idealistic tradition. From the mid-13th century a contrary trend became pronounced: down to earth, racy, irreverent, as in the *Roman de Renart* and numerous 13th- and 14th-century *fabliaux*. This trend was expressed in realistic, satirical 15th-century works—the *Cent nouvelles nouvelles*, Antoine de la Salle's *Petit Jehan de Saintré*. Boccaccio's *Decameron* (trans. 1485, 1545) reinforced the liking for gay, licentious stories; it was imitated in the *Heptaméron* (1558) of Marguerite d'Angoulême, queen of Navarre. Bonaventure des Périers and other 16th-century *conteurs* wrote in similar strain, which expanded in the masterpieces of Rabelais (*Gargantua, Pantagruel*, 1533–64).

The greatest writers of the 17th century almost entirely disregarded the novel. Nevertheless the novels of this age, whether precious, heroic or realist, clearly foreshadow subsequent developments. The innumerable pages of Honoré d'Urfé's *L'Astrée* (1607–27), of Georges and Madeleine de Scudéry's *Le Grand Cyrus* (1649–53) and *Clélie* (1654–61), now seem unsubstantial pageants, reviving the last enchantments of mediaeval romance. Yet they prepared the way for those subtleties of moral analysis in which the French novel was later to excel. Similarly, the cumbersome adventure stories of Marin le Roy, sieur de Gomberville, and Gauthier de Costes, seigneur de la Calprenède, anticipated a long-continuing fashion for tales of distant lands and olden times. Fantasy and ingenious philosophic speculation characterized the "science fiction" of Cyrano de Bergerac. The mainly satirical novels of Charles Sorel, Paul Scarron and Antoine Furetière were in sharp contrast, depicting graphically, sometimes crudely, the realities of contemporary bourgeois life. The only 17th-century novel still widely read is Marie de la Vergne, comtesse de la Fayette's *La Princesse de Clèves* (1678). Simple and concentrated, like classical tragedy, it treats moral problems as vital issues, not as agreeably sentimental debating points. Novels in general, however, remained conventional, improbable and diffuse. François de la Mothe Fénelon's idyllic prose-poem *Télémaque* (1699) was a courageous and enlightened manual of statecraft, written for his young pupil, heir to the French throne.

In the 18th century leading authors and thinkers, although not primarily novelists, began writing fiction in ways unknown before, Voltaire's sardonic conte *Candide* (1759) and Rousseau's *La Nouvelle Héloïse* (1761) being the outstanding successes. Alain

le Sage acclimatized the Spanish picaresque novel with his diverting *Gil Blas* (1715–35) and brought fiction closer to everyday reality. Pierre de Marivaux, both realistic and analytical, developed the novel of sensibility (*La Vie de Marianne,* 1731–41) and largely originated a vogue which English influences soon intensified. The abbé Prévost in *Manon Lescaut* (1731) created the first living romantic hero in French fiction. His translations from Richardson changed the course of the novel, particularly through Diderot and Rousseau. Diderot had a modern understanding of the relationships between environment and behaviour; his gift for dialogue and telling detail was equally original, but *Jacques le fataliste* and *Le Neveu de Rameau* appeared posthumously, too late to influence his contemporaries. Rousseau opened up countless new themes and modes of emotional experience and reinforced the growing view that fiction must serve to edify or enlighten. His disciple Bernardin de Saint-Pierre, in *Paul et Virginie* (1787), reintroduced the exotic novel, which Chateaubriand was to endow with the incomparable magic of his prose (*Atala,* 1801). Modern psychological realism owes much to Choderlos de Laclos for *Les Liaisons dangereuses* (1782) and to Restif de la Bretonne (*Monsieur Nicolas,* 1794–97).

The 19th century was the age of great novelists. Its range and resources were extended by the influences, first of Goethe, Byron, Sterne, Scott, Fenimore Cooper, and later of George Eliot, Ruskin, Dostoievski and Tolstoy. "Confessions" were long in favour. Chateaubriand, grand architect of romantic disillusion and melancholy, set the fashion with *René* (1802). Étienne Pivert de Sénancour's *Obermann* (1804) followed, then B. Constant de Rebecque's classically disciplined *Adolphe* (1816). Charles Augustin Sainte-Beuve's *Volupté* (1834), E. Fromentin's keenly perceptive *Dominique* (1862) and Gustave Flaubert's *L'Éducation sentimentale* (1869), less obviously autobiographical, continued this tradition. Madame de Staël, championing feminism and individual rights (*Delphine,* 1802), helped to transform the novel into a social instrument, so typically its function with later writers, notably Victor Hugo in *Les Misérables* (1862). The chief exponents of the historical novel, highly successful about 1830, were Alfred de Vigny, Honoré de Balzac, Prosper Mérimée, Hugo and Dumas *père*. To record and interpret the contemporary scene was pre-eminently the achievement of Stendhal and Balzac. Stendhal takes us deeply into motives, ambitions and frustrations in his great novels *Le Rouge et le noir* (1830) and *La Chartreuse de Parme* (1839); Balzac, in the 91 works which he co-ordinated together in *La Comédie humaine,* transports us into his own fictional world, unique in its vitality, dimensions and complexity. The popularity of novels depicting some particular region of France mainly dates from George Sand, whose descriptions. as in *La Mare au Diable,* though idealized, show understanding and personal observation. Flaubert's *Madame Bovary* (1857), both romantic and realist, marks the summit of artistic perfection; his heroine is one of the great characters of fiction. The naturalists who followed often emphasized the less prepossessing aspects of life: mannered and highly wrought with the Goncourt brothers (*Germinie Lacerteux,* 1865), compellingly powerful and evocative in Émile Zola, with *L'Assommoir* and *Germinal* outstanding in his *Rougon-Macquart* cycle. Alphonse Daudet, partly realist, possesses humour and sympathy, and Guy de Maupassant, greatest as a short-story writer, a sombre realism, tinged with genuine compassion. Charles Louis Philippe, vividly portraying the lowest social levels, has close links with Dostoievski. Toward 1900, and shortly afterward, the moral problems closely analyzed by Paul Bourget (*Le Disciple,* 1889), the nationalist preoccupations of Maurice Barrès and R. Bazin, the left-wing humanitarianism of Anatole France and Romain Rolland, gave a new complexion to the novel. Pierre Loti (real name Julien Viaud), Chateaubriand's heir in some respects, translated his journeyings into nostalgic reveries. Thereafter novelists turned increasingly to travel, exploration or adventure; *e.g.,* Valéry Larbaud, the brothers Jérôme and Jean Tharaud, C. Farrère, Louis Hémon, Louis Chadourne, Pierre Benoît, P. Mac-Orlan. René Boylesve, with his sensitive descriptions of Touraine, and many talented later novelists—A. de Chateaubriant, Henri Pourrat, Jean Giono, C. F. Ramuz, Maurice Genevoix and Henri Bosco—brought the regional novel into still greater favour.

With Marcel Proust, the novel became capable of conveying an immense variety of personal experience—the most elusive workings of the subconscious mind, the mysterious simultaneity of time present and time remembered (*A la Recherche du temps perdu,* 15 vol., 1913–28). André Gide analyzed moral issues, chiefly his own conflicts and self-questionings, with irony and classical lucidity (*La Porte étroite,* 1909; *Les Faux-Monnayeurs,* 1925). E. Estaunié set an ideal of solitude and inward self-fulfilment; Alain-Fournier (Henri Alain Fournier) conjured up a delightful autobiographical dream world in *Le Grand Meaulnes* (1913). Several leading writers linked their novels into many-volumed panoramas following the life history of an individual, family or social group: Romain Rolland, *Jean-Christophe;* R. Martin du Gard, *Les Thibault;* Georges Duhamel, *La Chronique des Pasquier.* The most far-reaching work of this kind was that of Jules Romains, in *Les Hommes de bonne volonté* (27 vol., 1932–46). Jacques de Lacretelle wrote a four-volumed cycle, *Les Hauts-ponts;* he is also a distinguished writer of analytical novels, as are E. Henriot, M. Prévost, Jacques Chardonne and M. Arland. World War I produced its own novelists, among whom Henri Barbusse, Roland Dorgelès and Georges Duhamel (a singularly humane writer) were conspicuous. Political and social issues following the war were discussed by widely differing writers, among them André Chamson and Louis Aragon. Modern uncertainties and disquietudes became a constant theme: François Mauriac concentrated his gaze on unregenerate man, in the intensely visualized setting of Bordeaux (*Noeud de Vipères, La Pharisienne*). G. Bernanos conveyed, with passionate integrity, visions of almost apocalyptic vehemence (*Sous le Soleil de Satan; Journal d'un curé de campagne*); M. Jouhandeau and Julien Green were no less anxiously concerned with the struggle between good and evil. Other novelists, notably André Malraux (*La Voie royale; La Condition humaine*) sought a new metaphysic. Henry de Montherlant (*Les Jeunes Filles,* etc.) stressed assertions of individualism. The generous, questing spirit of Antoine de Saint-Exupéry found an answer in community of effort; so, with rather less certainty, did Albert Camus (*La Peste,* 1947). J. P. Sartre (*La Nausée; Les Chemins de la liberté*) led the existentialist school. Quite distinct were Jean Giraudoux, a master of fantasy; and Colette, exquisitely sensuous in fine prose. (S. C. Gd.)

Germany.—The beginnings of the German novel may be traced back to the late middle ages. Elisabeth von Nassau-Saarbrücken translated French prose romances and Heinrich Steinhöwel Italian stories in the 15th century, and prose versions of older epics were produced. The 16th century saw the rise of popular collections of *facetiae,* anecdotal, satiric and didactic stories; Eulenspiegel and Faust were the most famous subjects. Signs of independence appeared in Jörg Wickram's *Goldfaden* (1557). *Der abenteuerliche Simplicissimus* (1669) by H. J. C. von Grimmelshausen, the story of the adventures of a simple-minded fellow during the Thirty Years' War, was the most important work of the 17th century. Defoe's *Robinson Crusoe,* translated in 1720, gave rise to a vast number of stories, known as *Robinsonaden,* with adventurous, satirical, didactic and utopian themes. The political novel, of which C. M. Wieland's *Der goldene Spiegel* (1772) is the best example, belonged to a kindred stream. Richardson's moralizing works were echoed by C. F. Gellert and S. von La Roche. In 1766–67 Wieland published his *Agathon,* the first German biographical novel or *Bildungsroman.*

In 1774 Goethe's *Werther,* owing much to Rousseau, appeared and let loose a flood of sentimentality and passion. *Wilhelm Meisters Lehrjahre,* Germany's most famous *Bildungsroman,* was published in 1795–96, followed by *Wilhelm Meisters Wanderjahre* in 1821–29. Goethe's *Die Wahlverwandtschaften,* a novel of renunciation, appeared in 1809. *Wilhelm Meister* greatly influenced the novels of the Romanticists J. L. Tieck, Novalis, Friedrich Schlegel, J. von Eichendorff and Eduard Mörike, Jean Paul's *Titan* (1800–03) being a further landmark in the movement that led to Gottfried Keller's *Der grüne Heinrich* (1854–55). The novel and short story were widely cultivated in the German Romantic movement; J. C. F. Hölderlin's elegiac *Hyperion,* the concentrated conflicts in Heinrich von Kleist's stories, the realism and historical in-

terest of Tieck's later works, the historical novels of Ludwig Achim von Arnim and Wilhelm Hauff, the social novels of Elisabeth (Bettina) von Arnim, the legendary stories of Friedrich de la Motte Fouqué, the mysterious and horrific narratives of E. T. W. Hoffmann, the criticism of contemporary insecurity provided by Karl Immermann, all being notable.

The increasing attention to realism in the middle of the 19th century, following the decline of romanticism, found expression in regionalism, historical fiction and social criticism. A. Stifter's still-life landscapes dwelt upon eternal human values, B. Auerbach wrote of Black Forest life, Jeremias Gotthelf (Albrecht Bitzius) composed novels of the Swiss peasantry with a didactic aim and Fritz Reuter wrote of his native Mecklenburg in Low German, pointing the way toward Peter Rosegger, the Styrian author of autobiographical, historical and polemical stories, and his fellow Austrian Ludwig Anzengruber, whose technique is almost naturalistic in his gripping narratives of country life. Willibald Alexis (G. W. H. Häring) wrote a series of well-documented novels on Prussian history, being followed in the sphere of historical fiction by Gustav Freytag (who also wrote important novels of contemporary life), C. F. Meyer and L. von François. Social tendentiousness found expression in the lengthy novels of Karl Gutzkow and afterward in Friedrich von Spielhagen and the longer works of P. J. L. von Heyse. Charles Sealsfield (Karl Postl) was noteworthy for his grandiose stories of North America. Theodor Fontane observed social situations with acute objectivity, and W. Raabe wrote studies of small-town life with resignation and sometimes humour. With the onset of naturalism at the end of the century psychological observation, social criticism, sexuality and materialistic pessimism came increasingly to the fore. Hermann Sudermann's East Prussian stories are not without sensationalism. Gerhart Hauptmann's novels reflect personal experiences and particularly erotic problems.

The most important figures emerged when naturalism gave way to impressionism. Hermann Hesse and Thomas Mann acquired international repute. The former's novels deal with problems of youth and friendship, approaching through self-analysis a new spiritual utopia in *Das Glasperlenspiel* (1943), while the latter is concerned with the contrast between bourgeois normality and artistic refinement which involves physical disintegration in *Buddenbrooks* (1901) and later works, including *Dr. Faustus* (1947), an indictment of Nazidom. J. Wassermann looked for spiritual redemption in face of modern perplexities. Among a number of women writers such as Gabriele Reuter, Clara Viebig and Ina Seidel, Ricarda Huch stands out for both stylistic skill and scholarly penetration, particularly in the field of historical narrative. The historical novel was cultivated as a means of revealing modern problems by parallel or contrast, regionalism (sometimes exaggerated) flourished because of the interest in environmental factors, while the colonial novel (Hans Grimm) was in some measure an offshoot of this latter. War novels appeared in the wake of both world wars, Erich Maria Remarque being popular after the first, T. Plievier acquiring fame after the second. E. Wiechert became important among those seeking spiritual certainty. Hermann Broch, Stefan Andres, E. Langgässer and W. Bergengruen were among the foremost post-World War II novelists, while Hans Carossa's autobiographical stories were extremely valuable documents. (A. Gs.)

Italy.—Boccaccio (1313–75), the father of Italian prose, was the first Italian writer to attempt long novels. This fervent admirer of Dante was certainly influenced by the lyrical inspiration of *Vita Nuova* when he wrote his *Filocolo*, a partly autobiographical novel portraying the story of Florio and Biancofiore; his *Ameto*, a pastoral novel interwoven with verse passages; and his *Fiammetta*, a study of the psychology of a disappointed lover. Unlike his short stories, Boccaccio's novels did not start a lasting fashion; the Italian Renaissance, in spite of its taste for the short story, was too enrapt in the contemplation of antiquity to relish long modern narrative works. It is doubtful whether the name of "novel" applies to Jacopo Sannazaro's *Arcadia* (1504) or to Francesco Colonna's *Hypnerotomachia Poliphili*, both imbued in their different ways with classical feeling; it certainly applies, however, to the humbler romances of Andrea da Barberino (*I Reali di Francia, Guerin Meschino*), whose fanciful treatment of an already declined world of chivalry achieved immense popularity from the early 15th century onward.

Seventeenth-century Italian novels all reveal French or Spanish influence, and although some were widely read and reprinted (G. V. Rossi's *Eudemia*, G. A. Marini's *Caloandro*, G. Biondi's *Eromena*) none had any real merit. With the late 18th century English influences became prevalent, and Alessandro Verri's *Notti Romane* (1792, 1804), a vision rather than a novel, is an example of this trend; Ugo Foscolo's *Ultime lettere di Jacopo Ortis* (1802) bear the mark of his genius in spite of the incoherences of Ortis' character and of the high-pitched style used throughout.

The coming of romanticism brought the historical novel to the fore. Alessandro Manzoni's *I Promessi sposi* (1825–27), by far the best Italian novel, is the only really great one of this kind, thanks to the successful blend of a historic background (Spanish-dominated Lombardy in the 17th century) with a fictional plot. Manzoni managed to infuse into his masterpiece his religious conscience and his outlook on life; his followers failed in varying degrees where their master succeeded. Massimo d'Azeglio's *Ettore Fieramosca* and *Niccolò de' Lapi*, Tommaso Grossi's *Marco Visconti* are enjoyable and their patriotic feeling is still effective; but F. D. Guerrazzi's rhetorical *La Battaglia di Benevento, L'Assedio di Firenze*, etc., Cesare Cantù's *Margherita Pusterla* and the many historical novels of such once highly rated authors as Bazzoni, Rosini, Tommaseo and Varese defy the patience and taste of the modern reader. In the second half of the 19th century the historical novel gave way gradually to the realistic novel; this movement toward *verismo*, already heralded by G. Rovani (*I Cento anni*), I. Nievo (*Confessioni d'un Italiano*) and G. Ruffini (*Lorenzo Benoni, Il Dottor Antonio*), found its highest expression in Giovanni Verga's masterpieces (*I Malavoglia*, 1881; *Mastro Don Gesualdo*, 1889) and affected much or little other novelists of this time (S. Farina, G. Rovetta, L. Capuana, F. de Roberto, M. Serao and G. Deledda), whose works were often inspired by life in their own districts and thus can be described as regional as well as realistic; while A. Fogazzaro's large output was influenced by his religious views and E. de Marchi (*Demetrio Pianelli*, etc.) owed much to Manzoni. The many novels of Gabriele d'Annunzio (1863–1938) cannot be given a definite label—they are, like the rest of his work, the expression of his self-asserting personality, frenzied sensuality and capacity for enjoying and describing all things beautiful.

It is difficult to pick out a prevalent trend in the narrative literature of the first 40 years of the 20th century. Luigi Pirandello's novels, which can be linked with Sicilian realism, develop the same themes as his plays; other distinguished novelists who left their mark in this period were A. Panzini, A. Palazzeschi, M. Bontempelli and G. Papini. Italo Svevo's *La Coscienza di Zeno*, a striking novel which stands out among the output of the 1920s, reveals many European influences; while in the '30s R. Bacchelli (*Il Mulino del Po*) and Ignazio Silone (Secondo Tranquilli), a political exile (*Fontamara, Pane e vino*), were more traditional in their approach. After World War II came the neorealist movement, full of vitality and freshness; it was mainly represented by C. Pavese, E. Vittorini and V. Pratolini, while A. Moravia pursued his quest in the realm of human psychology with ever-refined powers of observation. (U. L.)

Russia.—Nikolai Karamzin's *Poor Liza* (1792) was the first Russian novel proper and first suggests the beginnings of a reading public in Russia. The mediaeval chronicles and prose epic tales, the polemical writings of the 16th and 17th centuries and the beginnings of literary satire in the 18th century—all of which did something to make a way for the novel—will therefore be passed over. The short story, in which Russia has been especially happy (*see*, for example, the many brilliant and widely influential tales or *Rasskazy* of Anton Chekhov), must also be ignored, though it is hard to say whether Alexander Pushkin's *The Captain's Daughter*, which showed (1836) the influences of Byron and Scott in a pioneering masterpiece, is a long story or a short historical novel.

Karamzin's sentimental novel mentioned above shows the re-

sponse of Russia to the common European influences implied in the names of such writers as Sterne and Richardson; but the beginning of the really significant history of the Russian novel proper may perhaps best be placed at Mikhail Lermontov's *A Hero of Our Time* (1840). This gives the character of the Russian "superfluous man" with a blend of poetic sensitiveness and genius for character drawing that is especially Russian.

The greatness of the Russian novel, viewed from the European and world standpoint, covers the period from the publication of Nikolai Gogol's *Dead Souls* (1842) to the death of Maxim Gorky in 1936, though the revival of the historical novel among Soviet writers after that (*e.g.*, Mikhail Sholokhov and Sergei Borodin) produced some very talented and effective work. In this period the outstanding impressions are of profound psychology (including latterly that of the subconscious), deep moral sensitiveness, subjective character painting (especially the abnormal), a gift for what may be called serious comedy and an intense social consciousness. But perhaps the outstanding achievements are to be seen in the philosophical presentation of history on a vast canvas in Count Leo Tolstoy's *War and Peace* (1862–69) and in an almost universal genius for presenting vividly interesting, significant women. The idea of presenting the typical Russian "hero of our time," whether as failure (as in Ivan Goncharov's *Oblomov*, completed 1858) or idealized in the "socialist realism" of Soviet Russia after the Revolution, runs all through Russian fiction.

Gogol's *Dead Souls*, influenced by Dickens, shows the blending of deadly satire with vivid characterization. Ivan Turgenev's novels stand out as almost alone combining a French sense of form with Russian realism. His best work, *Fathers and Children* (completed 1862), also provides the first full-length portrait, in Bazarov, of a Nihilist. Theodore Dostoievski's four greatest novels—*Crime and Punishment* (1866), *The Idiot* (completed 1869), *The Possessed* (1871) and *The Brothers Karamazov* (1880)—have been a potent influence in Europe in their intensely subjective moving qualities and vividness of human pathology, which seems to anticipate existentialism. Tolstoy has been the greatest Russian world influence as a quasi-religious thinker; but his *Anna Karenina* (1875–77) has all the best qualities of a novel proper, and this along with his *War and Peace*, which is one of the world's masterpieces, shows a genius for presenting essentially Russian character including most notably the peasant. A markedly dramatic quality, which characterizes the Russian novel throughout, was continued in the social didactic fiction of Maxim Gorky (*e.g., The Artamonovs' Business*, completed 1926) and in Soviet historical fiction, such as Sholokhov's *And Quiet Flows the Don* (1933) and Borodin's *Dmitri Donskoi* (1942). (C. L. W.)

Scandinavia.—Though Ludvig Holberg already practised the art of the novel, it was not until the 19th century that this genre definitely conquered in Scandinavia. One of its principal forms was the "family" novel, often with a marked preoccupation with the position of woman. Camilla Collett (Norwegian) introduced it with *The Governor's Daughters* (1855); Fredrika Bremer (Swedish, 1801–65) wrote a series of novels about woman and the home in the upper middle class. The family novel reached its highest achievement in *The Family at Gilje* (1883) by Jonas Lie (Norwegian), who also wrote a psychological novel about marriage, *The Pilot and His Wife*, besides his descriptions of life at sea. Historical themes were adopted in some of the novels by B. S. Ingemann (Danish), Z. Topelius (Finnish), Carsten Hauch (Danish) and J. P. Jacobsen (Danish), who wrote the crowning work of the Danish historical novel, *Marie Grubbe* (1876). The pioneer of the novel dealing with folk life is S. S. Blicher (Danish), who already in the 1820s describes folk life in Jutland in a narrative that combines lyrical emotion with telling realism and suggestive power. The charming peasant novels of Björnstjerne Björnson (Norwegian) came in the late 1850s, nearly 20 years after the Swedish K. J. L. Almqvist's short stories, but they belong, like these, to the transition period leading to modern realism. Of the purely realistic novels of folk life should be noted *Hemsöborna* by A. Strindberg (Swedish, 1849–1912), a masterpiece illustrating life in the Swedish countryside, and *Hard Times* and *Woman's Rule* by the Finn K. A. Tavastjerna (1860–98). During the realistic period the folk-life genre, however, often was replaced by the propagandist novel of social themes, inspired by French naturalism. A great number of authors cultivated this form (Sophus Schandorph, Henrik Pontoppidan and Herman Bang in Denmark; Björnson, Alexander Kielland, Lie and Arne Garborg in Norway; Ernst Ahlgren [Victoria Benedictsson], Anne Charlotte Leffler and Gustaf af Geijerstam in Sweden). It attained a peak in Strindberg's *The Red Room* (1879). With some, naturalism developed into a philosophy. Outstanding among these was J. P. Jacobsen, who in *Niels Lyhne* (1880) describes the life and death of a confirmed atheist; here the ways of hope are all closed. Many novels, naturally, fall outside the groups here indicated; among these are Hans Christian Andersen's *The Improvisatore* (1835), an autobiographical travel novel from Italy inspired by Mme de Staël's *Corinne*, Selma Lagerlöf's *Gösta Berlings saga* (1891), permeated by a fervent, rhetorical hero worship, and Knut Hamsun's *Hunger* (1890).

In modern times a great number of novelists appeared on the literary scene. Most universally known are perhaps Pär Fabien Lagerkvist (Swedish) and Sigrid Undset (Norwegian). The novels of the former (*Guest of Reality*, 1925; *The Hangman*, 1933; *The Dwarf*, 1944; *Barabbas*, 1950) are, like his dramas and poems, the testimonies of a ceaseless moral struggle to found a heroic humanism in a world of darkness and confusion. The religious ideas sometimes professed by the author have a character of immanence. Sigrid Undset, who was converted in 1924, was, on the contrary, inspired by the transcendentalism of the Roman Catholic faith. Her masterpieces, the two great historical novels *Kristin Lavransdatter* (1920–22) and *The Master of Hestviken* (1925–27), create a Norwegian mediaeval world of monumental greatness, engaged in the eternal struggle between good and evil but also warm with human passions and with an everyday realism. (D. A. H.)

Spain.—Prose fiction in Spain had its origin in the collections of oriental apologues—*Disciplina clericalis, Calila e Dimna, Sendebar, Barlaam y Josafat*—which from the 12th and 13th centuries circulated in Latin or Spanish translation, mostly through the Arabic. The romance of chivalry, deriving from the Carolingian and Arthurian epic cycles, produced its most famous exemplar in *Amadís de Gaula*, of which the lost original (*c.* 1300) may have been Portuguese. In the Catalan *Tirant lo Blanc* of Joanot Martorell (1460) chivalresque fantasy came down, exceptionally, to earth. The *Amadís*, reworked by Garcí Rodríguez de Montalvo and printed in 1508, spawned a monstrous progeny of Esplandians, Palmerins and other progressively more incredible heroes which held Spain in thrall down the century. The picaresque novel (*q.v.*) was born with the anonymous *Lazarillo de Tormes* (1554), while the pastoral novel, Italian in origin, achieved with the *Diana* of Jorge de Montemayor (*c.* 1559) Spanish garb and a fame to which alike Miguel de Cervantes Saavedra (*Galatea*, 1585) and Lope de Vega (*Arcadia*, 1598) paid tribute. Cervantes' *Don Quixote* (1605–15), begun as a counterblast to the romances of chivalry, proved to be the transition to the modern novel in its blending of different planes of thought and action and its presentation of character in solution. In the same author's *Novelas ejemplares* (1613) there emerged, alongside Italianate tales of romantic adventure, the conception of the short story as a re-creation of atmosphere and character. Later 17th-century fiction was dominated by the picaresque. The 18th century, in which French pseudoclassicism threatened to eclipse the native literary tradition, produced but one novel of note, José Francisco de Isla's *Fray Gerundio de Campazas* (1758–68), a satiric deflation, again picaresque in technique, of the pulpit bombast then current. With romanticism, Scott's *Waverley* novels led poets and dramatists to essay, with scant success, the historical novel (José de Espronceda's *Sancho Saldaña*, 1834; Mariano de Larra's *El Doncel de don Enrique el Doliente*, 1834; Francisco Martínez de la Rosa's *Doña Isabel de Solís*, 1837–46); but not till mid-century, notably with Fernán Caballero's *La Gaviota* (1849), did the novel, aided by the *costumbrismo* of essayists such as Estébanez Calderón, Mesonero Romanos and Larra, rediscover its true Spanish bent to lie in the realistic depicting of the contemporary scene.

In the 50 years following the "regional" novel became the dominant literary kind, with Pedro Antonio de Alarcón, José María de Pereda, Emilia Pardo Bazán, Armando Palacio Valdés and others. The two latter, attracted for a moment by French naturalism, soon discarded it in favour of the more genial Spanish conception of realism, which prefers the optimistic approach. Juan Valera added to regionalism a note of classical detachment and a more analytical psychology. Benito Pérez Galdós (1843–1920), the greatest of modern Spanish novelists, stood outside the regionalist movement; come to Madrid from the Canary Islands, he saw Spain whole and, deeply concerned with social problems, sought their roots in the preceding half-century. His 46 *Episodios nacionales* and 34 novels on contemporary themes depicted on an epic scale, and with a profound sense of character, the life of 19th-century Spain. Miguel de Unamuno (1864–1936) and Pío Baroja (1872–) took to the novel the preoccupations of the "generation of 1898" concerning Spain's role and destiny after the loss of the last American colonies. Unamuno's concern was with the individual soul, hence the introspective probing and the total absence of externals, Baroja's with the indictment of society. Vicente Blasco Ibáñez (1867–1928) allied much crude vigour in portraying the Spanish scene to a strong reformist bias; Ricardo León (1877–1943), by contrast, exalted traditional values in a rich nostalgic prose. The preciosity of the "modernist" Ramón del Valle-Inclán (1869–1936) classed him primarily as a stylist. In Gabriel Miró (1879–1930) a like concern for style was allied to a delight in the minutiae of the external world, as it was in Ramón Pérez de Ayala (1881–) to the sensuous appreciation of human nature. The Civil War of 1936–39 and its aftermath weighed heavily: Camilo José Cela (*La Familia de Pascual Duarte*, 1942; English trans. 1946) and Carmen Laforet (*Nada*, 1944) were among the first to give promise that the novel would with time recover its prestige. (W. C. An.)

THE U.S. NOVEL

Early Period.—The demand for novels, frowned upon by the Puritan regime in early America, began to be gratified in the mid-18th century by English importations and, a little later, by crude native experiments. The first American novel, William Hill Brown's (1765–93) *The Power of Sympathy* (1789), was compounded of sensational materials—seduction, rape, suicide—which were glossed over by genteel language. Of the few novels published before the time of James Fenimore Cooper, only those of Charles Brockden Brown possess more than historical significance. Brown's *Wieland* (1798), a breathless story of religious mania leading to murder committed under the immediate stimulus of ventriloquism, exhibited genuine tragic power. Cooper, author of many historical romances, was unquestionably a writer of the first rank. After misfiring in an attempt to produce a good "social-life" novel (*Precaution*, 1820), he astonished and delighted the English-reading public with *The Spy* (1821), a story smelling of real American soil, pounding with excitement and invested with an aura of patriotism. Soon thereafter he began his *Leatherstocking Tales*, a series of stories centred in the exploits of the resourceful, courageous, magnanimous Natty Bumppo. The plots were generally a variation on one of the oldest themes known to fiction, namely, flight and pursuit. Not preconceived as a series by Cooper, these stories may be read in the order of Natty's experience: *The Deerslayer* (1841); *The Last of the Mohicans* (1826); *The Pathfinder* (1840); *The Pioneers* (1823); *The Prairie* (1827). A prolific writer, Cooper also produced novels of the sea (*The Pilot*, 1823) and novels critical of American democracy (*Home as Found*, 1838).

Nathaniel Hawthorne had no such spectacular popular success as Cooper. His novels are overlaid by allegory and symbol to such an extent that the outline of the action is shrouded in ambiguity. His major interest was in some form of damage to the soul, whether by concealed sin, as in *The Scarlet Letter* (1850); by the effect of Puritan fanaticism as in *The House of the Seven Gables* (1851); or by a "crime" to which an individual is apparently impelled by a species of determinism, as in *The Marble Faun* (1860). Such remedies and compensations as are available—confession, expiation, recognition of the principle of good out of evil—serve at best to induce a kind of sober satisfaction. A master of probing, psychological study and subtle stylistic modes, Hawthorne inspired many later writers, among them Henry James and T. S. Eliot. Herman Melville was finally also preoccupied with the problem of evil, but his fiction was more robust than Hawthorne's and he was capable of writing stirring adventure stories such as *Typee* (1846). His greatest work, *Moby-Dick* (1851), often regarded as the greatest novel written in English, also may be read as a tale of external adventure relating to a whaling voyage, but inwardly it is lined with metaphysical speculation regarding the "nature of ultimate reality." Melville's philosophical conclusions are not clear-cut, but it is apparent that he tended to be pessimistic about the cosmos and the heart of man. His *Pierre* (1852) and *The Confidence-Man* (1857) are documents revealing profound disillusionment. More faith in humanity and providence was shown by Harriet Beecher Stowe, whose *Uncle Tom's Cabin* (1852), an inferior work of art, became one of the best sellers of all time.

Shortly after the Civil War three novelists of original power and lasting influence made their first appearances: the comic satirist Mark Twain, the realist William Dean Howells and the impressionist Henry James. Mark Twain was essentially a democratic writer. In *Tom Sawyer* (1876) and *Huckleberry Finn* (1884) he showed ordinary American boys in revolt against "culture" and in quest of normal boyhood adventure on the Mississippi river. His *The Innocents Abroad* (1869) made fun of the pretensions of aesthetes. In *The Prince and the Pauper* (1882) and *A Connecticut Yankee in King Arthur's Court* (1889) his humour was put to the service of vitriolic satire whose targets were those institutions—political, religious, economic—which in his opinion oppressed mankind. His posthumous *The Mysterious Stranger* (1916) is a story embodying pessimistic conclusions about the nature of man and God. Stylistically Mark Twain bequeathed to his successors in the novel a superb model of the colloquial idiom.

Howells also wrote of authentic American types and ideals, but his manner was more conservative than Mark Twain's. In *The Rise of Silas Lapham* (1885) he recorded the career of an American businessman of humble origins who proved himself both a self-made man and a good loser. Many of his novels, such as *A Hazard of New Fortunes* (1890), deal with fluctuations of fortune created by social and economic inequalities. Others deal realistically, but not violently, with love; among these are *A Modern Instance* (1882), a story of divorce. Howells was for a time influenced by Tolstoy, but his novels owed their best qualities to his shrewd observation of superficially unexciting middle-class American life.

James largely avoided the U.S. scene but made much use of American character. His typical procedure was to deploy American characters opposite to European characters in a European setting (England, Italy, France) and to reveal, more by means of analysis and dialogue than by "action," their responses to the phases of an ethical or social problem turning on a point of honour. The American characters tend to be frank, unsophisticated, sometimes vulgar and noisy, often spiritually very sensitive. In *The American* (1877) the hero is a rich, uncultivated American whose fine moral perceptions make him "victorious" even though he fails

to win his bride. Isabel Archer in *The Portrait of a Lady* (1881) submits to much suffering because her finely attuned sense of honour forbids her leaving a cruel husband. Charged with reducing his external actions below the threshold of average reader interest, especially in the novels of his maturity such as *The Ambassadors* (1903), James responded that very little outward action is necessary for "impressions *are* experience."

By the end of the 19th century the number of competent American novelists had grown tremendously. Among the significant writers who appeared in the 1890s was Stephen Crane, whose *The Red Badge of Courage* (1895) blended impressionism and naturalism in its study of battle. Frank Norris' *The Octopus* (1901), an economic novel set in California, was one of many American novels to show the increasing influence of Zola. Upton Sinclair's *The Jungle* (1906) was in effect an angry cry for redress of the plight of immigrant workers employed in the Chicago stockyards. Theodore Dreiser's *Sister Carrie* (1900) sounded one of the first notes in the battle to liberate women from earlier standards of morality. Meanwhile there had been a large-scale, gaudy revival of the historical romance, symbolized by Charles Major's (1856–1913) *When Knighthood Was in Flower* (1898). (A. Ce.)

Twentieth Century.—The death of James in 1916 and of Howells in 1920 left Edith Wharton (1862–1937) the most distinguished U.S. novelist for those who thought of fiction, in traditional terms, as a picture and critical-moral evaluation of contemporary life. Mrs. Wharton's moral and aesthetic values were close to James's, but her instinct for the concrete prevented her from forsaking actualities to anything like the extent James did in his final phase. She came closest to his method in *The Reef* (1912). In early novels such as *The House of Mirth* (1905), she is very critical of the inflexibility and insensitiveness of the New York society world of her youth, but by the time she wrote *The Age of Innocence* (1920) her disgust over the collapse of standards and values in postwar United States had caused her to interfuse her satire with a beautifully restrained nostalgia. Later critics showed that *Ethan Frome* (1911), a bitter idyll of rural New England, is less remote from her main themes than was once supposed. They are still inclined to see in her later novels a falling off from her highest standards, but such books as *The Children* (1928) and her last, unfinished novel, *The Buccaneers* (1938), would need to be exempted from this somewhat hasty generalization.

Methods and outlooks not unlike Mrs. Wharton's were manifested by the Boston jurist Robert Grant (1852–1940) (*Unleavened Bread,* 1900; *The Chippendales,* 1909; etc.) and by Robert Herrick (1868–1938), who, in such books as *The Common Lot* (1904) and *The Memoirs of an American Citizen* (1905), applied New England standards in an unflattering study of the corrupting influences of commercialism and industrialism upon men and women, as observed in Chicago between the World's fair of 1893 and World War I. Herrick liked his "idealistic" novels best, but only one of these, *Clark's Field* (1914), ranks with his finest work. His most powerful novel is *Waste* (1924), a castigating survey of American life in its public and private aspects. Booth Tarkington (1869–1946) expresses similar social criticism in *Alice Adams* (1921) and in the trilogy *Growth—The Turmoil* (1915), *The Magnificent Ambersons* (1918) and *The Midlander* (1924)—but he was more popular in less austere manifestations, as in *Seventeen* (1916) and the *Penrod* books (1914 ff.)

Three significant later writers in the Wharton tradition were F. Scott Fitzgerald (1896–1940), Sinclair Lewis (1885–1951) and John P. Marquand (1893–). Fitzgerald (*This Side of Paradise,* 1920) lived and recorded the tragedy of the Jazz Age; he died before full development, but both *The Beautiful and Damned* (1921) and *The Great Gatsby* (1925) are serious in outlook, and his last, uncompleted novel about the cinema, *The Last Tycoon* (1941), tantalizes with suggestions of unfulfilled possibilities. Sinclair Lewis became the most talked-of novelist in the U.S. with his indictment of culture-starved small towns in *Main Street* (1920); he went on to attack the shortcomings of businessmen, scientists and preachers, respectively, in *Babbitt* (1922), *Arrowsmith* (1925) and *Elmer Gantry* (1927). The name of the Dickensian hero of the first of these has passed into the language; the second best expresses Lewis' values—his faith in science and the free life; the third reveals his prickly, village atheist side. Perhaps his last quite first-rate book was *Dodsworth* (1929), a more thorough picture of the American businessman abroad than either James or Howells achieved. Later Lewis novels are less powerful and more respectful of established standards; he reflects the pressures of the period in his attacks on fascism in *It Can't Happen Here* (1935) and race prejudice in *Kingsblood Royal* (1947). Marquand's special subject is the New England gentleman in an uncongenial and "hard-boiled" environment. *The Late George Apley* (1937) was a satirical apotheosis of the Beacon hill aristocrat; *Wickford Point* (1939), *H. M. Pulham, Esquire* (1941) and *Point of No Return* (1949) were perhaps the most notable among the novels that followed.

Long before Mrs. Wharton's death, her position was sharply challenged by two other women—Willa Cather (1873–1947) and Ellen Glasgow (1874–1945). Because she began writing about Nebraska pioneers, Bohemian and Scandinavian, in *O Pioneers!* (1913) and *My Ántonia* (1918), Willa Cather was often called a regionalist. Actually she was interested in pioneers as in great artists—*The Song of the Lark* (1915), etc.—because of a reality in them that fascinated her imagination. In her early phase she seemed more vital than Edith Wharton, closer to the roots of America and of life itself, but she had no sympathy with the dominant interests of her own time, and her studies of her contemporaries in *One of Ours* (1922) and *The Professor's House* (1925) reflect bitter disillusion. Now frankly regarding herself as one of the "backward," she retreated to the past and to traditional religious values in the lovely *Death Comes for the Archbishop* (1927) and *Shadows on the Rock* (1931). Ellen Glasgow had been writing the social history of Virginia in fiction since the beginning of the century, but not until after *Barren Ground* (1925) did she receive adequate recognition for either her fine art or her service in demolishing the old southern sentimental tradition. *The Romantic Comedians* (1926), *They Stooped to Folly* (1929), *The Sheltered Life* (1932) and *Vein of Iron* (1935)—ingenious blendings of old and new values—were all widely read.

Mary Austin (1868–1934), Zona Gale (1874–1938), Dorothy Canfield (1879–), Elsie Singmaster (1879–) and Elizabeth Madox Roberts (1886–1941) were other prominent women novelists of the period; of these, Miss Roberts received the widest critical acclaim. *The Time of Man* (1926), which made her reputation, combined the values and methods of Sherwood Anderson and Virginia Woolf; *My Heart and My Flesh* (1927) in some aspects anticipated Faulkner. Even in that luminous historical novel *The Great Meadow* (1930), most of the action lies within the mind. The symbolical *He Sent Forth a Raven* (1935) represents the fullest development of Miss Roberts' extremely subtle art.

Naturalism, meanwhile, was having its great American triumph in the post-World War I vogue of Theodore Dreiser (1871–1945), who had begun as early as 1900 with *Sister Carrie* but until now had won no adequate hearing. The trilogy comprising *The Financier* (1912), *The Titan* (1914), and *The Stoic* (1947) was based on the career of the "robber baron" Charles T. Yerkes. Dreiser's greatest success came with *An American Tragedy* (1925), but by this time the mechanistic philosophy to which he once adhered was beginning to seem inadequate to him. *The Stoic,* accordingly, imposes mystical overtones upon a character originally conceived in naturalistic terms, and the central figure of *The Bulwark* (1946) is a Quaker saint, sympathetically portrayed.

James T. Farrell (1904–)—the *Studs Lonigan* trilogy (1932 ff.), etc.—became Dreiser's most important disciple; like Dreiser, he developed his own brand of Marxism. John Dos Passos (1896–) was considered radical in his earlier years, but his disillusionment over the New Deal changed all that. In *Manhattan Transfer* (1925) and the trilogy *U.S.A.* (1937), Dos Passos attempted the "collectivist novel," describing the life of city and nation and introducing interesting technical innovations: "biographies," "news reels" and "the camera eye." There are naturalistic elements, too, in the Idaho novelist Vardis Fisher (1895–);

see the tetralogy beginning with *In Tragic Life* (1932).

A much more "professional" radical, Upton Sinclair (1878–), well-known from his exposé of the Chicago stockyards in *The Jungle* (1906), found a large public with a long series of novels dramatizing contemporary history, beginning with *World's End* (1940). The proletarian novel movement of the 1930s produced Albert Halper (1904–), who began with the regional *Union Square* (1933) and went on to depict occupational backgrounds in *The Foundry* (1934) and *The Chute* (1937).

The post-World War I years produced a franker fiction than the United States had known before, but this did not always make for naturalism. The preoccupation of Sherwood Anderson (1876–1941) with sex and with humble people was often interpreted as allying him with the naturalists, but his technique was more like that of the impressionists. The postwar years also liberated fantasy. This is seen most impressively in the work of James Branch Cabell (1879–), whose immense *Biography of the Life of Manuel* (1904–30), filling 18 volumes, is the most substantial piece of romanticism since *The Faerie Queene*. The scene ranges from modern Virginia to Cabell's own imagined mediaeval French province, Poictesme—the link between the two worlds is described in *The Cream of the Jest* (1917)—and the tone blends disillusion with mischievous sexuality and a wistful hungering for faith. Long a neglected writer, Cabell was notably served by the New York Society for the Suppression of Vice when it attacked *Jurgen* (1919), one of the most important novels in the *Biography*.

Varied aspects of romance and fantasy appear also in the work of John Erskine (1879–1951), who, after the success of his impudent *The Private Life of Helen of Troy* (1925), proceeded to apply the same formula to other famous historical and fictional characters; of the poet Elinor Wylie (1885–1928), who produced four distinguished and utterly dissimilar novels, of which the most popular was *The Orphan Angel* (1926); of Thornton Wilder (1897–), whose *The Bridge of San Luis Rey* (1927) was one of the unexpected successes of American literature; and of Robert Nathan (1894–), whose beautiful style and ironic sentiment embodied themselves in a number of novels and who came into new and deserved popularity after *One More Spring* (1933).

Ernest Hemingway (1898–), the voice of the "lost generation" and the most famous American writer since Mark Twain, though essentially a short story writer, still exercised an important influence upon the novel, both through his themes and his spare, athletic, deeply felt and disciplined style. *The Sun Also Rises* (1926) was followed by *A Farewell to Arms* (1929), the great love story of World War I. *For Whom the Bell Tolls* (1940) brought a new sense of social responsibility out of the Spanish Civil War. His *The Old Man and the Sea* (1952) concerned his favourite theme, man's naked strength and courage pitted against the worst that life can do to him.

After Hemingway, the American novelists who received the largest amount of critical attention in this period were Thomas Wolfe (1900–38), William Faulkner (1897–), Erskine Caldwell (1903–) and John Steinbeck (1902–).

Like Fitzgerald, Wolfe, the most autobiographical of all U.S. novelists, died in the making. The surging, tumultuous power of *Look Homeward, Angel* (1929), *Of Time and the River* (1935) and their successors make it hard to believe that Wolfe was influenced by so highly disciplined a writer as Joyce. Caldwell's early novels—*Tobacco Road* (1932) and *God's Little Acre* (1933)—were taken seriously at first, but most critics later dropped him as a writer of "shockers." Steinbeck, who scored his greatest success when *The Grapes of Wrath*, published at the height of New Deal economic experimentation in 1939, became the most widely read sociological novel of the time, is hard to classify, for he has never stopped experimenting. Both *Tortilla Flat* (1935) and *Cannery Row* (1945) glorified a natural, animallike existence, but *East of Eden* (1952) reaffirms man's freedom of choice and moral responsibility. Steinbeck's biological training inclined him to apply an optimistic naturalistic determinism to human affairs, but he also shows tendencies toward mystical transcendentalism, and he is much given to symbolism.

Many critics, however, would rate the Mississippi novelist William Faulkner as possessing the most powerful imagination of any American novelist of the period. He, too, has often seemed a sensationalist, notably in *Sanctuary* (1931), and many readers were astonished when, upon receiving the Nobel prize for 1949, he declined "to accept the end of man . . . because he alone among creatures has a soul, a spirit capable of compassion and sacrifice and endurance." It is man's failure to live on his highest spiritual level which produces the horrors that Faulkner so often depicts and deplores. All his most significant novels—*Sartoris* (1929), *The Sound and the Fury* (1929), *As I Lay Dying* (1930), *Light in August* (1932), *Absalom, Absalom!* (1936), *The Hamlet* (1940), etc.—are a part of the Yoknapatawpha saga, the history of an imaginary southern county, from the 1830s, treated on the level of legend and myth.

Another characteristic of the period was the revival of the historical novel, moribund since the revival at the turn of the century had spent itself. Mary Johnston (1870–1936) linked the two revivals; her later, deeply mystical books, beginning with *Foes* (1918), though neglected by the public, were far more significant than *To Have and To Hold* (1900) and its successors. Just after World War I, Joseph Hergesheimer (1880–1954) displayed his great knowledge of early Americana in *Java Head* (1919) and other books. But the real revival dated from the sensational success of the *Anthony Adverse* (1933) of Hervey Allen (1889–1949) and the *Gone With the Wind* (1936) of Margaret Mitchell (1900–49). Equally plethoric at a later date were Carl Sandburg's one novel, *Remembrance Rock* (1948), and the remarkable and many-levelled *Raintree County* (1948) of Ross Lockridge, Jr. (1914–48). During years of war and depression, novels about the American past furnished strength and courage, and clarification of values, to many Americans. Substantial reputations were won by, among others, Kenneth Roberts (1885–), Walter D. Edmonds (1903–), Esther Forbes (?–) and Conrad Richter (1890–), who rightly insisted that his purpose, in his trilogy comprising *The Trees* (1940), *The Fields* (1946) and *The Town* (1950) and elsewhere, was "not to write historical novels but to give an authentic sensation of life in early America."

The biblical and religious novels ministered even more directly to the same needs. Lloyd C. Douglas (1877–1951), whose career culminated in *The Robe* (1942) and *The Big Fisherman* (1948), was the most "successful" of religious novelists, but there were better artists among them, such as Gladys Schmitt (1909–) (*David the King*, 1946) and Florence Marvyne Bauer (?–) (*Behold Your King*, 1945). Since Sholem Asch (1880–) long lived in the U.S. though still writing in Yiddish, his New Testament trilogy, beginning with *The Nazarene* (1939), might also be classified here.

The traditional western novel found a fine artist in Eugene Manlove Rhodes (1869–1934) (*e.g.*, his *Best Novels and Stories*, 1949) and was despecialized and brought into line with the main tendencies of serious modern fiction by H. L. Davis (1896–) (*Honey in the Horn*, 1935; and *Winds of the Morning*, 1952), Walter Van Tilburg Clark (1909–) (*The Ox-Bow Incident*, 1940) and A. B. Guthrie, Jr. (1901–) (*The Big Sky*, 1947; and *The Way West*, 1950).

World War II produced many novels, generally much more throughly disillusioned than the books which came out of World War I. Values are honoured in such books as *Mister Roberts* (1946), by Thomas Heggen (1919–49); *Tales of the South Pacific* (1947), by James A. Michener (1907–); and certainly in *A Bell for Adano* (1944) and *The Wall* (1950), by John Hersey (1914–). But the same cannot always be said of the work of such writers as Norman Mailer (1923–) (*The Naked and the Dead*, 1948); John Horne Burns (1916–53); and others. Other products of the war generation, though not essentially writers of war books, include Truman Capote (1925–) (*Other Voices, Other Rooms*, 1948) and Gore Vidal (1925–), both technically adroit but spiritually hollow. There is more to be hoped for, however, from Frederick Buechner (1926–) (*A Long Day's Dying*, 1950; and *The Seasons' Difference*, 1952).

Other novelists whose work attracted attention and who cannot be classified as belonging to any school include the varied and prolific Louis Bromfield (1896–); Gerald Warner Brace (1901–), best known for *The Garretson Chronicle* (1947); Benedict Thielen (1902–), one of the most undeservedly neglected writers (*The Lost Men*, 1946; *Friday at Noon*, 1947; etc.); the accomplished James Gould Cozzens (1903–); Robert Penn Warren (1905–); J. D. Salinger (*The Catcher in the Rye*, 1951); Pearl S. Buck (1892–), who specialized in China; Katherine Anne Porter (1894–); the Florida novelist Marjorie Kinnan Rawlings (1896–1953) (*The Yearling*, 1938); Jean Stafford (1915–); and Carson McCullers (1917–).

Bibliography.—The fullest general treatment of the contemporary U.S. novel is in Edward Wagenknecht, *Cavalcade of the American Novel* (New York, 1952), where *see* extensive bibliography. Harry R. Warfel, *American Novelists of Today* (New York, 1951), comprises factual, not critical, data on nearly all living novelists. The earlier writers covered in this article are considered in Arthur Hobson Quinn, *American Fiction* (New York, 1936), and Carl Van Doren, *The American Novel, 1789–1939*, rev. ed. (New York, 1940). *See* also Frederick J. Hoffman, *The Modern Novel in America, 1900–1950* (Chicago, 1951), and Harold C. Gardiner (ed.), *Fifty Years of the American Novel: A Christian Appraisal* (New York, 1951). John W. Aldridge, *After the Lost Generation* (New York, 1951), is the pioneering book on novelists of the 1940s.

Works containing chapters on some of the novelists here considered include Malcolm Cowley (ed.), *After the Genteel Tradition* (New York, 1937); Vernon Loggins, *I Hear America . . .* (New York, 1937); Percy H. Boynton, *America in Contemporary Fiction* (Chicago, 1940); N. Elizabeth Monroe, *The Novel and Society* (Chapel Hill, 1941); Edwin B. Burgum, *The Novel and the World's Dilemma* (New York, Oxford, 1947); George Snell, *The Shapers of American Fiction, 1798–1947* (New York, 1947); W. M. Frohock, *The Novel of Violence in America, 1920–1950* (Dallas, 1950); and three books by Maxwell

Geismar: *Writers in Crisis* (Boston, 1942), *The Last of the Provincials* (Boston, 1947; London, 1948) and *Rebels and Ancestors* (Boston, 1953).

Important books on individual novelists include Blake Nevius, *Edith Wharton* (Berkeley, 1953); Arthur Mizener, *The Far Side of Paradise* (Fitzgerald) (Boston, 1951); E. K. Brown and Leon Edel, *Willa Cather* (New York, 1953); Robert H. Elias, *Theodore Dreiser, Apostle of Nature* (New York, 1949); Irving Howe, *Sherwood Anderson* (New York, 1951); Carl Van Doren, *James Branch Cabell,* rev. ed. (New York, 1932); Carlos Baker, *Hemingway: The Writer As Artist* (Princeton, 1952); Herbert J. Muller, *Thomas Wolfe* (New York, 1947); Irving Howe, *William Faulkner* (New York, 1952); Harry T. Moore, *The Novels of John Steinbeck* (Chicago, 1939). (E. Wt.)

NOVELDA, a town of east Spain, in Alicante province, on the right bank of the river Vinalopó and on the railway from Madrid to Alicante. Pop. (1940) 8,798 (mun. 10,349). The country is flat and fertile, producing much wine, dates, oranges, oil, saffron and aniseed. At Salinetas de Elda near by are warm sulphur and saline baths.

NOVELLO, the name of a family of English musicians. VINCENT NOVELLO (1781–1861) was born in London on Sept. 6, 1781. From 1796 to 1822 he was successively organist at the Sardinian, Spanish and Portuguese chapels, and from 1840 to 1843 at St. Mary's chapel, Moorfields. He was an original member of the London Philharmonic society, which he sometimes conducted. In 1849 he went to live at Nice, where he died on Aug. 9, 1861. He composed a great quantity of sacred music; but his finest work lay in the introduction to England of unknown compositions by the great masters. The masses of Haydn and Mozart were unknown in England until he edited them, as were also the works of Palestrina and the treasures of Italian music in the Fitzwilliam museum, Cambridge. The first work Novello published, *Novello's Sacred Music, as Performed at the Royal Portuguese Chapel,* appeared in 1811 and marks the founding of the publishing house of Novello.

JOSEPH ALFRED NOVELLO (1810–1896), eldest son of the above, was born in London on Aug. 12, 1810, and died at Genoa on July 16, 1896. He had a career as a bass singer and in 1829 became a regular music publisher. He really created the house of Novello. He first introduced cheap editions to England and departed from the method of publishing by subscription. His assistant Henry Littleton became a partner in 1861 and, when J. A. Novello retired in 1867, sole proprietor. The firm of Ewer and Co. was acquired in 1867 and with it all the copyrights of Mendelssohn's works then existing. On Littleton's death (1888) his two sons carried on the business. His grandsons also eventually became directors. Novello's grew, and became the sole British agent for many continental music publishers.

CLARA ANASTASIA NOVELLO (1818–1908), daughter of Vincent Novello, was one of the most famous sopranos of her time. She was born in London on June 10, 1818. She won continental as well as English renown after she sang at Mendelssohn's invitation at the Gewandhaus concerts in Leipzig in 1837. She died in Rome on March 12, 1908.

NOVEMBER, the ninth month of the old Roman year [Lat. *novem,* nine], which began with March. By the Julian arrangement, according to which the year began with Jan. 1, November became the 11th month and had 30 days assigned to it. Nov. 11 was held to mark the beginning of winter; it is now the day of solemn commemoration of the end of World War I. The senate desired to rename the month in honour of Tiberius—his birthday occurring on the 16th, but the emperor declined, saying, "What will you do, Conscript Fathers, if you have *thirteen* Caesars?" The Anglo-Saxon names for November were *Windmonath,* "wind month" and *Blodmonath* "bloodmonth."

NOVERRE, JEAN GEORGES (1727–1810), French dancer and ballet master, was born in Paris on March 29, 1727. He composed his first ballet in 1747 for the Opéra Comique. After a year spent in Berlin, he mounted the ballets of Christoph Willibald Gluck and Niccola Piccini in Paris in 1749. He was in London (1755–57) and in Lyons (1758–60). From the publication of *Lettres sur la danse et les ballets* may be dated the revolution in the art of the ballet for which Noverre was responsible. (*See* BALLET.) He was next engaged by the duke of Württemberg, and afterward by the empress Maria Theresa, until, in 1775, he was appointed, at the request of Queen Marie Antoinette, *maître des ballets* of the Paris Opera. This post he retained until the Revolution reduced him to poverty. He died at St. Germain on Nov. 19, 1810.

Noverre's friends included François Voltaire, Frederick the Great and David Garrick (who called him "the Shakespeare of the dance"). The ballets of which he was most proud were his *La Toilette de Vénus, Les Jalousies du sérail, L'Amour corsaire* and *Le Jaloux sans rival.* Besides the letters, Noverre wrote *Observations sur la construction d'une nouvelle salle de l'Opéra* (1781); *Lettres sur Garrick écrites à Voltaire* (1801); and *Lettre à un artiste sur les fêtes publiques* (1801).

NOVGOROD (formerly known as *Velikiy-Novgorod,* Great Novgorod), a town of the Russian S.F.S.R., in the Leningrad region, in 58° 33′ N., 31° 20′ E., on the navigable Volkhov, 2 mi. below the point where it issues from Lake Ilmen. Pop. (1933) 38,000. The town has sawmills and manufactures boots and shoes, candles, bricks and tiles and has a brewery and a distillery.

The date at which the Slavs first erected forts in the marshy region of the Volkhov near Lake Ilmen is unknown. That situated on a low terrace close by Lake Ilmen was soon abandoned, and Novgorod or "New-town" (in contradistinction to the Scandinavian Aldegjeborg or Ladoga) was founded by Scandinavian searovers as Holmgård on another terrace which extended a mile lower on both banks of the river. The older fort (Gorodishche) existed in the 13th century. Even in the 9th century the new city on the Volkhov exercised a kind of supremacy over the other towns of the lake region, when its inhabitants in 862 invited the Varangians, under the leadership of Rurik, to the defense of the Russian towns of the north. Down to the end of the 10th century Novgorod to a certain extent depended on Kiev; yet in 997 its inhabitants obtained from their prince Yaroslav a charter which granted them self-government. For five centuries this charter was the bulwark of the independence of Novgorod. From the end of the 10th century the princes of Novgorod, chosen either from the sons of the great princes of Kiev (until 1136) or from some other branch of the family of Rurik, were always elected by the *vyeche;* but they were only its military defenders, and their delegates were merely assessors in the courts which levied taxes for the military force raised by the prince. The *vyeche* invariably expelled the princes as soon as they provoked discontent. Their election was often a subject of dispute between the wealthy and the poorer classes; and Novgorod, which was dependent for its corn supply upon the land of Suzdal, was sometimes compelled to accept a prince from the Suzdal branch instead of from that of Kiev. After 1270 the city often refused to have princes at all, and the elected mayor was the representative of the executive. Novgorod in its transactions with other cities took the name of "Sovereign Great Novgorod" (*Gospodin Velikiy Novgorod*). The supreme power was vested in the *vyeche.* The city, with a population of more than 80,000, was divided into wards, each ward constituting a distinct commune. The wards were subdivided into streets, which corresponded to the occupations of their inhabitants, each being quite independent with regard to its own affairs.

Trade was carried on by corporations. By the Volkhov and the Neva, Novgorod—then known also as Naugart and Novwerden—had direct communication with the Hanseatic and Scandinavian cities, especially with Visby or Wisby on the island of Gotland. The Dnieper brought it into connection with the Bosporus, and it was an intermediary in the trade of Constantinople with northern Europe. The Novgorod traders penetrated to the White sea shores, hunted on Novaya Zemlya in the 11th century, colonized the basins of the northern Dvina, descended the Volga, and as early as the 14th century extended their trading expeditions beyond the Urals into Siberia. Two great colonies, Vyatka and Vologda, organized on the same republican principles as the metropolis, favoured the further colonization of northeast Russia.

It is said that the population of Novgorod in the 14th century reached 400,000, but the pestilences of 1467, 1508 and 1533 carried off no fewer than 134,000 persons. These figures seem to relate rather to the whole Ilmen region.

Invasions of Novgorod.—Novgorod's struggle against the Suzdal region (now the government of Vladimir) began in the

12th century. In the following century it had to contend with the Swedes and the Germans, who were animated not only by the desire of territorial acquisition, but also by the spirit of religious proselytism. Their advances were checked by battles at Ladoga and Pskov in 1240 and 1242 respectively. Protected by its marshes, Novgorod escaped the Mongol invasion of 1240–42, and repelled the attacks of the princes of Moscow by whom the Mongols were supported. It also resisted the attacks of Tver.

The first serious invasion, in 1332, was rolled back with the aid of the Lithuanians. But in 1456 the great prince of Moscow imposed a heavy tribute. Ivan III of Moscow took possession of the colonies in the northern Dvina and the Perm regions, and began two bloody wars, during which Novgorod fought for its liberty under the leadership of Martha Boretskaya, the mayor. In 1475–78 Ivan III entered Novgorod, abolished its charters, and carried away 1,000 of the wealthier families, substituting for them families from Moscow; the old free city then recognized his sovereignty. A century later Ivan IV (the Terrible) abolished the last vestiges of the independence of the city. Having learned that a party favourable to Lithuania had been organized in Novgorod, he took the field in 1570, and entered the city (much weakened by the recent pestilences) without opposition. His followers killed the heads of the monasteries, the wealthier of the merchants and clergy, and burned and pillaged the city and villages. No fewer than 15,000 were massacred at Novgorod alone (60,000 according to some authorities). A famine ensued, and the district of Novgorod fell into utter desolation. Thousands of families were transported to Moscow, Nijni-Novgorod, and other towns of the principality of Moscow.

In the beginning of the 17th century Novgorod was taken and held for seven years by the Swedes; and in the 18th century the founding of St. Petersburg (now Leningrad) finally destroyed its trade. Its position on the water highway from the Volga to St. Petersburg and on the trunk road from Moscow to the capital, still gave it some commercial importance; but even this was destroyed by the opening of the Vishera canal, connecting the Msta with the Volkhov below the city, and by the construction of the railway from St. Petersburg to Moscow, which did not reach Novgorod. Later a branch loop linked the town with the main line and its position improved.

Antiquities.—The town consists of a Kremlin (old fortress), and of the city, which stands on both banks of the river, connected by a handsome stone bridge. The Kremlin was much enlarged in 1044, and again in 1116. Its stone walls, originally palisades, were begun in 1302, and much extended in 1490. Its historical monuments include the cathedral of St. Sophia, built in 1045–52 by architects from Constantinople to take the place of the original wooden structure (989), destroyed by fire in that year. Apart from minor changes the building remained unaltered until its restoration in 1893–1900. It contains highly-prized relics, including 12th century bronze doors, one brought reputedly from Sigtuna, the ancient capital of Sweden. Another ancient building in the Kremlin is the Yaroslav tower. Other remarkable monuments are the church of St. Nicholas (1135), the Znamenski cathedral (14th century), and churches of the 14th and 15th centuries. Within the town itself there are four monasteries and convents, two of them dating from the 11th century and two from the 12th century; and the large number in the immediate neighbourhood shows the great extent which the city formerly had. A monument to commemorate the 1,000th anniversary of the foundation of Russia (the calling in of the Varangians by Novgorod in 862) was erected in 1862. Another monument commemorates the repulse of the Napoleonic invasion of 1812.

NOVI PAZAR (ancient *Rashka*), the capital of the department of Novi Pazar, South Serbia, Yugoslavia, lies at the head of the fertile valley of the Upper Rashka, on the site of the ancient Serbian city of Rashka. Pop. (1931) 10,364, comprising Serbs, Albanians and some Greeks. Agriculture is the only industry. There are Roman baths in the vicinity, and in the old church of St. Peter and St. Paul, the metropolitan church of the bishopric of Rashka, Stephen Nemanya, founder of the Serbian empire, passed from the Roman to the Greek church in 1143. The town was taken by the Serbs and Montenegrins in the Balkan Wars (1912–13), and assigned to Serbia by the Treaty of Bucharest (1913). It was occupied by German troops in 1941.

NOVI SAD (German *Neusatz*), a town of the Voivodina, Yugoslavia. Pop. (1931) 63,985. It is the seat of a Greek Orthodox bishop, and is a prosperous town with wide, well-paved streets, public gardens, a cathedral, a hospital, schools, theatres and barracks. There is a daily market for household commodities, and for the artistic pottery and cotton goods manufactured in the town. Before the union of the province with Yugoslavia at the close of World War I Novi Sad was the literary and religious centre of the Serbians in Hungary, especially after the foundation in 1864 of the *Matica Srbska*, or Serbian Literary society. The town was founded in the middle of the 18th century, and was almost totally destroyed during the revolution of 1848–49. In 1941 Hungarian troops occupied the town and it was reincorporated into Hungary.

NOVOCAINE, an artificial alkaloid, and the most satisfactory of the local anaesthetics introduced in recent years. The hydrochloride is employed in medicine ($C_{13}H_{21}O_2N_2Cl$) and it is a substitute for cocaine. It is very soluble in water and for subcutaneous injections is far superior to cocaine for several reasons: its solutions can be sterilized by boiling whereas cocaine would decompose; it has no irritant action and is of very low toxicity, whereas cocaine is both irritant and toxic. (*See* DRUG ADDICTION and COCAINE.)

NOVOCHERKASSK, a town of the Russian S.F.S.R., in the North Caucasian area, at the confluence of the Don and Aksai rivers, in 47° 28′ N., 40° 5′ E. Pop. (1939) 81,286. It manufactures cloth and machinery and is a collecting centre for corn, wine and timber exports.

Novocherkassk was founded in 1805, when the inhabitants of Old Cherkassk were compelled to leave the site because of the frequent inundations of the Don.

NOVOMOSKOVSK, a town of the Ukrainian S.S.R., 16 mi. N.E. of Dnepropetrovsk (Ekaterinoslav), in 48° 38′ N., 35° 16′ E. Pop. (1926 census) 10,564. It extends some distance along the right bank of the Samara river, a tributary of the Dnieper; its main industry is brickmaking. The Zaporogian Cossacks occupied the site in the 17th century, when it was known as Samarchik. In 1687 Prince Golitsuin founded the Ust-Samara fort there, destroyed after the Treaty of Pruth (1711), but rebuilt in 1736. Near it is the Samarsko-Nikolayevskiy monastery.

NOVOROSSIISK (nŏv-ō-rŏss′ĭsk), Russian S.F.S.R. port on N.E. coast of the Black sea in 44° 42′ N., 37° 45′ E., in the North Caucasian area. Pop. (1939) 95,280. It has connections with the net of Russian railways, with Baku, and with Rostov-on-Don. It has large cement works, and its exports are mainly cement, naphtha, potash, leaf tobacco and champagne, its imports being machinery, coke and coal. Its grain export trade, formerly about 70%, is insignificant, naphtha and cement having largely replaced it. The bay, nearly 3 mi. wide at its entrance and 5 mi. deep from east to west, is exposed to the violent northeast wind (bora), sweeping down from the Caucasus. There is accommodation for 36 steamers. The town became Russian in 1829.

NOVOSIBIRSK (formerly Novo-Nikolayevsk), the chief town in the Siberian Area of the Russian S.F.S.R., in lat. 55° 6′ N., long. 83° 6′ E., situated on the navigable Ob river, where the trans-Siberian railway crosses it on a 9 span bridge 30 ft. above high water level. The town was founded in 1896, but had in 1939 a population of 405,589. In 1915 a branch line was opened from Novosibirsk going through Barnaul, with a branch to Biisk, and on to Semipalatinsk, and a link with the railways of the central Asiatic Russian republics was completed in 1930. There is telegraphic communication with Mongolia. The town is a centre for distributing agricultural machinery. There are also grain elevators, one with a capacity of 16,070 tons, and several well set up flour mills. Butter trains, with ice trucks, start daily for the west, and frozen meat is also exported to Leningrad and Moscow. There are three electric sawmills in Novosibirsk dealing with the timber from this region. The town also exports the woodcock, hazelhen and quails. Other industries are brickmaking, iron-

smelting, oil pressing, distilling, brewing and leather preparation.

NOWATA, a city of northeastern Oklahoma, U.S., in the valley of the Verdigris river; the county seat of Nowata county. It is served by the Missouri Pacific railway. The population was 3,965 in 1950 and 3,904 in 1940 by the federal census. It is the trade centre of a farming, stock-raising and oil-producing region. The city was founded in 1889, when the Missouri Pacific came through, and was incorporated in 1892. In 1913 it adopted a commission-manager form of government.

NOWAWES, a town of Germany, in the province of Brandenburg, 2 mi. E. from Potsdam, on the Berlin-Potsdam railway. The town was founded by Frederick the Great in 1754, and in 1907 the village of Neuendorf was incorporated with it. The industries of Nowawes include the spinning and weaving of jute and silk and the manufacture of cloth, electrical apparatus, boots and locomotives.

NOWELL, ALEXANDER (1507?–1602), dean of St. Paul's, London, son of John Nowell or Read hall, Whalley, Lancashire, was educated at Brasenose college, Oxford, where he is said to have shared rooms with John Foxe. He was elected fellow of Brasenose in 1526. He became master of Westminster school (1543) and prebendary of Westminster (1551). In Mary's reign he was deprived of his prebend, probably as being a married man, before May 1554, and sought refuge at Strasbourg and Frankfort, where he developed puritan and almost presbyterian views. He submitted, however, to the Elizabethan settlement of religion and was rewarded with the archdeaconry of Middlesex, a canonry at Canterbury and in 1560 with the deanery of St. Paul's. His sermons occasionally created some stir and on one occasion Elizabeth interrupted his sermon, telling him to stick to his text and cease slighting the crucifix. He held the deanery of St. Paul's for 42 years, surviving until Feb. 13, 1602. Nowell is believed to have composed the Catechism inserted before the Order of Confirmation in the Prayer Book of 1549, which was supplemented in 1604 and is still in use. Early in Elizabeth's reign he wrote a larger catechism, to serve as a statement of Protestant principles; it was printed in 1570, and in the same year appeared his "middle" catechism, designed for the instruction of "simple curates."

NOWGONG, a town and district of India, in the Assam Valley division of Assam province. The town (pop. [1941] 12,972) is situated on the Kalang river. The district of Nowgong has an area of 3,898 sq.mi. and a pop. (1941) of 710,800. It consists of a wide plain overgrown with jungle and canebrakes, intersected by numerous tributaries of the Brahmaputra and dotted with shallow marshes. The Mikir hills cover an area of about 65 mi. by 35 mi. in the south of the district; the highest peak is about 3,500 ft. The slopes are very steep and are covered with dense forest; reserved forests cover 500 sq.mi. The Kamakhya hills near the bank of the Brahmaputra are about 1,500 ft. high. On the summit of the highest peak is a celebrated temple of Kamakhya, the local goddess of love, where three annual festivals are held. The staple crop is rice. Tea cultivation and manufacture are carried on but the soil and climate are not so favourable as in upper Assam.

The section of the Assam-Bengal railway from Gauhati to the hills passes through part of the district, and a branch runs through it from Chaparmukh to Silghat steamer station. Lumding is a railway centre of some importance.

NOWGONG, a town of India, headquarters of the Bundelkhand agency, in the state of Chhatarpur, on the border of the former British district of Jhansi. Pop. (1941) 5,999. Kitchener college, an Indian army institution for the training of noncommissioned officers, is situated there.

NOWY SACZ (NEU SANDEC), town, Poland, in the province of Kraków. Pop. (1931) 30,278; (1946) 23,049. It grew to importance through the oriental trade in the 14th century and owed much to the patronage of Casimir the Great. It is near the Carpathians in the valley of the Dunajec, in the country of the Gorale, or Polish Highlanders, It has a church founded by the Franciscans in the 14th century.

Germany took the town in 1939. It was returned to Poland in 1945.

NOYES, ALFRED (1880–), English poet, was born in Staffordshire on Sept. 16, 1880, and educated at Exeter college, Oxford. The *Loom of Years*, his first volume of poems, appeared in 1902, and his *Collected Poems* in 1910, 1920, 1927 and 1947. His *Forty Singing Seamen* (1907) and *Drake* (1908) struck the patriotic note of a poet of the sea. A volume of lectures given in America, *The Sea in English Poetry*, was published in 1913 and in 1914 he was elected to a professorship of modern English literature at Princeton university, Princeton, N.J., which he resigned in 1923. His other publications include: *The Wine Press* (1914); *The Watchers of the Sky* (1912); *Aspects of Modern Poetry*, essays (1924); *The Torch-bearers* (3 vol., 1922, 1925 and 1930; 1 vol., 1937); *Robin Hood*, poetic drama (1927); *Ballads and Poems* (1928); *The Return of the Scarecrow*, novel (1929); *The Opalescent Parrot*, essays (1929); *Voltaire* (1936); *Orchard's Bay* (1939); *The Edge of the Abyss* (1944); and *Shadows on the Down* (1945).

NOYON, a city of northern France, in the department of Oise, 67 mi. N.N.E. of Paris by the railway to Brussels. Pop. (1946) 6,035. Noyon is built at the foot and on the slopes of a hill.

Noyon, the ancient Noviomagus Veromanduorum, was Christianized by St. Quentin at the end of the 3rd century; and about 530 St. Medard, bishop of the district of Vermandois, transferred his see there from St. Quentin. St. Eligius was bishop in the 7th century. Charlemagne was crowned there in 768 and Hugh Capet elected in 987. Till the French Revolution the bishopric was one of the ecclesiastical peerages of the kingdom.

At the beginning of the 12th century Noyon obtained a communal charter through the favour of its bishops. Toward the middle of the 12th century the diocese of Tournai was split off. Noyon was ravaged by the English and the Burgundians during the Hundred Years' War. The city was captured by the Spaniards in 1552, and by the Leaguers who were expelled in 1594 by Henry IV. John Calvin was born there in 1509.

Noyon was occupied by the German army in 1914 and was abandoned, bombarded and reduced to ruins, 1917–18. Its beautiful transitional Romanesque Gothic cathedral was burned, and so was the old *hôtel-de-ville*. A good deal of the stone work of the cathedral survived the fire and was later restored. Again in June 1940 Noyon was occupied by the Germans. The town has good trade in livestock and grain and contains chemical and artificial manure works and iron foundries.

NUBA, THE. The Nuba may be regarded as the Negro or negroid aborigines of Kordofan, although at mid-20th century the northern half of the area was inhabited by Arabic-speaking tribes professing Islam, so that Dar Nuba, the country of the Nuba, occupies only the southern half of the administrative province, extending over 2½° to 10° N.

One of the most remarkable features of Dar Nuba is the multiplicity of languages spoken within its bounds. The inhabitants of hills only a few miles apart may speak languages mutually unintelligible, and even on the same *massif* there may be two or three communities speaking different languages and coming little in contact with one another, though their customs and beliefs are fundamentally the same.

The inhabitants of the hills of southern Kordofan situated but little north of the Bahr-el-Ghazal have a series of languages with grammatical structure and vocabularies differing substantially from the Berberine dialects. The resemblances noted between the latter and those of Kordofan apply only to those spoken by a limited number of northern communities which have been subjected to foreign (*i.e.*, Berberine) influence for a considerable period. Moreover, as Meinhof points out, such "Nubian" or "Hamitoid" languages extend scarcely a hundred miles south of El Obeid. Farther south in the territory recognized by the Arabs as the true home of the Nuba (Dar Nuba corresponding on the administrative side roughly to the Jebel subprovince) two groups of languages must be recognized. One includes a number of "Sudan" lan-

guages, the other a series of tongues, called by Meinhof "pre-Hamitic," which, in some respects, resemble Bantu and Fulani and which Struck now terms "Bantoid." These latter languages, first noted in 1910, differ from the Berberine dialects, in which grammatical changes in both nouns and verbs are produced by suffixes, in that in the Bantoid languages these are brought about by initial change.

Struck, who has also studied the Nuba physical material available from the standpoint of its distribution among the linguistic groups considers that each is to be distinguished physically, and although the small number of individuals measured belonging to the Nubian and Sudanic groups renders some of Struck's conclusions premature it is probably true to say that the Bantoid group, with an average stature of 68 in. and a cephalic index of 76.5, is rather longer headed and narrower nosed than the Sudanic who are themselves rounder-headed than the Nubian-speaking group from whom they do not substantially differ in breadth of nose or face.

Mode of Life.—The Nuba are for the most part agriculturists, the regulation of public life in each community being ultimately in the hands of the rainmaker. There is no clan organization among the southern Nuba and no restrictions upon marriage other than those imposed by blood relationship. No bride-price is paid, and either party can break the marriage at pleasure; property passes in the female line. This applies especially to the southern communities speaking Bantoid languages; further north, where a bride-price is paid, matters are less simple. Neither circumcision nor infibulation is practised, but the women of Jebel Talodi and the hills round it perforate the lower lip, in which they wear a quartz ornament. On many hills, especially where the lip ornament is worn, the lower incisors are removed in both sexes.

Darfur.—The non-Arab races of Darfur belong ethnically to, or originated from (many are now mixed) the hill stock, spoken of in Kordofan as Nuba (*supra*). In the north are the Bedayat, a nomad people related to Zaghawa; to the north of these are the Kura'an, who have been identified with the ancient Garamantes. The Zaghawa to the south are mentioned by Mas'udi, while Ibn Khaldun speaks of them as living further east, and at the present day there is a colony of them at Jebel Kagmar in Kordofan. These folk, although Mohammedans, have not yet given themselves Arab pedigrees; they retain their belief in rainmakers and are noted as potters. The people of Jebel Midob about 400 mi. west of Khartoum, described by MacMichael, differ but little from the Nuba of Kordofan; they are perhaps the least unknown of the pagan tribes of Darfur. The Tungur and Dargu are other ancient peoples of Darfur, the latter living by cultivation and breeding cattle in the fertile areas to the west of Dara. None of these peoples are as important as the Fur, from whom the country takes its name. Their stronghold is or was the considerable range known as Jebel Marra, whence they descended probably in the 17th century. Now nominally Mohammedans they still worship stones or trees to the extent that certain spots associated with rocks or trees are regarded as holy and are the scenes of sacrifice. (C. G. S.)

NUBAR PASHA (1825–1899), Egyptian statesman, was born at Smyrna in Jan. 1825, the son of an Armenian merchant named Moghreditch who had married a relative of Boghos Bey, an influential minister of Mohammed Ali. He was educated at Vevey and by the Jesuits at Toulouse. After about 18 months' training he was made second secretary to Mohammed Ali. In 1845 he became first secretary to Ibrahim Pasha, the heir apparent, and accompanied him on a special mission to Europe. Abbas Pasha, who succeeded Ibrahim in 1848, maintained Nubar in the same capacity and sent him in 1850 to London as his representative to resist the pretensions of the sultan, who was seeking to evade the conditions of the treaty under which Egypt was secured to the family of Mohammed Ali. There he was so completely successful that he was made a bey. In 1853 he was sent on a similar mission to Vienna, where he remained until the death of Abbas in July 1854. The new viceroy, Said, at once dismissed him from office, but two years afterward appointed him his chief secretary and later gave him charge of the important transport service through Egypt to India. Nubar was then mainly instrumental in the completion of railway communication between Cairo and Suez. After falling a second time a victim to Said's caprice and being dismissed, he was again sent to Vienna, but returned as principal secretary to Said, a position he held until Said's death in Jan. 1863.

On the accession of Ismail (*q.v.*), Nubar Bey was in the prime of life. He was already on friendly terms with Ismail; he even claimed to have saved his life—at all events, it was a coincidence that the two had together refused to travel by the train the accident to which caused the death (on May 14, 1858) of the prince Ahmed, who would otherwise have succeeded Said. Ismail charged him with a mission to Constantinople, to notify his accession and to smooth the way for various projects, notably the completion of the Suez canal, the change in title to that of khedive and the change in the order of succession. The sultan, believing as little as every one else that the canal was anything more than a dream, gave his consent at a price the moderation of which he must afterward have regretted. The gratified Ismail created Nubar a pasha, and the sultan himself, persuaded to visit Cairo, confirmed the title so rarely accorded to a Christian. Nubar was sent to Paris to complete the arrangements and to settle the differences between Egypt and the canal company.

On his return Nubar created the department of public works; but in 1866 he was made minister of foreign affairs and at once went on a special mission to Constantinople, where he obtained the sultan's consent to the adoption by Ismail of the title of khedive and the change in the law of succession. Nubar now had a harder task to undertake than ever before. The antiquated system of "capitulations" which had existed in the Ottoman empire from the 15th century had grown in Egypt until there were practically 17 *imperia in imperio* (*see* EGYPT: *History*). That in spite of the jealousies of all the powers, in spite of the opposition of the Porte, he should have succeeded in replacing the 17 consular courts by mixed international courts with a uniform code puts Nubar in the first rank of statesmen of his period.

The extravagant administration of Ismail, for which perhaps Nubar can hardly be held wholly responsible, had brought Egypt to the verge of bankruptcy, and Ismail's disregard of the judgments of the court at last compelled Great Britain and France to interfere. Under pressure, Ismail, who began to regret the establishment of the international courts, assented to a mixed ministry under Nubar, with Charles Rivers Wilson as minister of finance and De Blignières as minister of public works. Nubar, finding himself supported by both Great Britain and France, tried to reduce Ismail to the position of a constitutional monarch, but he lost the support of Great Britain and France and was dismissed. (*See* ISMAIL.) He remained out of office until 1884, when he was induced to become premier as the instrument of British policy, but he soon found himself in disagreement with Lord Cromer and was dismissed by the khedive Tewfik in 1888. Riaz Pasha, who succeeded him, was, with one interval of eight months, prime minister until April 1894, when Nubar returned to office. By that time Cromer had more completely grasped the reins of administration as well as of government, and Nubar had realized more clearly the role which an Egyptian minister was called on to play: Lord Cromer was the real ruler of Egypt, and the death of Tewfik in 1890 had necessitated a more open exercise of British authority. In 1895 Nubar completed his 50 years of service and retired. He died in Paris in Jan. 1899.

See P. Crabitès, *Ibrahim of Egypt* (London, 1935).

NUBIA, a region of northeastern Africa, between upper Egypt, the Red sea and the Libyan desert and extending south indefinitely to about Khartoum. It includes the Nile valley from Aswan near the First Cataract to the confluence of the White and Blue Niles, stretching for about 560 mi. between latitudes 16° and 24° N. Nubia, however, has no strictly defined limits and is little more than a geographical expression. Its name is derived from *nob* (slave) in the Mahas dialect of the language known as Nubian, of which four different dialects are spoken between Aswan and Dongola.

The first historical mention of the Nuba is in Strabo, *Geography*, book 17, ch. 1 and 2, where they are described as "a large tribe,

who beginning at Meroe, extend as far as the bends of the river and are not subject to the Ethiopians but are divided into several separate kingdoms."

The country consists mainly of sandy desert and rugged and arid steppes and plateaus through which flows the Nile. In this section of the river there occurs a continuous series of slight falls and rapids, and between Khartoum and Philae it makes a great S-shaped bend, the region west of the Nile within the lower bend being the Bayuda desert and that east of the Nile the Nubian desert, which districts roughly correspond to the conventional divisions of upper and lower Nubia respectively. Most of Nubia is within the almost rainless zone. An auriferous district lies between the Nile and the Red sea, in 22° N. Politically Nubia is now divided between Egypt and the Anglo-Egyptian Sudan and has no administrative existence.

The life and agriculture of Egypt and the Sudan depend upon the Nile (*q.v.*), which, for a great part of its course, flows through Nubia. The railway from Alexandria and Cairo terminates at El-Shellal and is joined by a steamer service with Wadi Halfa. The Sudan railway system connects Wadi Halfa, Atbara, Port Sudan, Kassala, Gedaref, Sennar, Kosti and El Obeid. Kosti is connected by river steamer and road with east Africa. (D. M. H. E.)

ARCHAEOLOGY

In Nubia the early Stone Age ran its usual course. Pre-Chellean tools occur at Wadi Halfa and at Nuri below the Fourth Cataract. Chellean tools are found at Wadi Halfa, between the Second and Third Cataracts at Sai Island and Wawa, in Wadi Hudi near the mouth of the Atbara river and near Omdurman. Acheulean tools occur near Wadi Halfa, at Lagiya in the Wadi el-Gaab and at Omdurman. Early Levallois occurs near Tangâsi between the Third and Fourth Cataracts; and Acheulean-Levallois hybrid cultures near Wadi Halfa, at Selima oasis, north of Abri and, in the Tumbian form, at Omdurman.

The Levalloisian technique lasted long. It is seen in the Sebilian culture from Kom Ombo and in surface finds all over Nubia; and it still affected cultures at the beginning of the historic period.

Fossils have been found associated with the Sebilian at Wadi Halfa. In the Upper Sebilian, microliths become dominant, suggesting the Capsian culture from North Africa with its backed-blade technique. Similar microliths are widely found on the surface; and at Khartoum a culture with Capsian connections and indistinguishable from the Wilton of South Africa occurs with bone spears with four or more barbs, barbed bone arrowheads and red-ware pottery bowls decorated with wavy-line impressions made by a catfish spine. The makers were Negroes who lived by hunting and fishing. They had no domestic cattle and did not cultivate. This culture has been found as far north as the Fourth Cataract and between Wadi Howar in the west and Kassala in the east.

It was followed between Jebel Aulia and the Second Cataract by one in which gouges, celts and amazon stone beads, all typical of the Fayum Neolithic, occur with pottery, most of which is burnished and the most typical of which is a hard red ware decorated with triangular impressions in a pattern imitating basketwork. This pattern developed out of the wavy-line pottery of Early Khartoum. Early forms of black and black-topped red ware occur; and shards burnished after combing or incision show how easily rippled ware could have developed. With this Khartoum Neolithic culture occur zeolite lip plugs, notched fishhooks of shell and bone harpoons, most of which have four or more barbs and a perforated butt and resemble examples from Taferjit and Tamaya Mellet in French West Africa. The next culture so far known is one with pottery sometimes decorated with ripples made by pebble burnishing over combing. One such pot found at Omdurman is identical in all but size with one from the A-group cemetery at Faras near Wadi Halfa, which has been dated to the reigns of Zer and Zet (about 3000 B.C.) by pottery and copper tools imported from Egypt. At Omdurman about 18 pots were buried in each grave. Gourd shapes were common and small deep bowls. Large deep bowls of coarse red ware decorated with squares alternately plain or hatched by impressions made by catfish spines show connections with both Early Khartoum and the Gerzean of Egypt.

Rock pictures are frequent along the Nile between the First and Third Cataracts, and while no doubt a few representing wild animals date from the prehistoric period, all historic periods are represented. Sites of the earlier Egyptian predynastic have not been found south of Dakka. There is on a rock near the Second Cataract an apparent reference to the conquest of lower Nubia by Zer, third king of the 1st dynasty, and Egyptian imports dating from his and the succeeding reign were found in the neighbouring A-group cemetery of Faras. Lack of sites in Nubia associated with the Old Kingdom may be because of the activities of those Pharaohs: the earliest historic reference to Nubia is to a raid by Seneferu (*c.* 2750 B.C.) who built ships and "hacked up" the land of the Nehesi (*cf.* modern Mahas) and brought back many prisoners and cattle; it is probable that such raids devastated a land in which civilization had flourished during the Neolithic and predynastic periods. Under the 5th and 6th dynasties (2500–2300 B.C.) Egypt's contact with the south became rather more peaceful. Although under Pepi I military expeditions had been led by Uni to the Nehesi lands of Irthet, Medju (*cf.* modern Beja), Yam, Wawat, Kau and the land of Temeh, nevertheless Herkhuf of Elephantine made four trading expeditions during the reigns of Merenre and Pepi II, as far as Yam (Darfur ?), returning with donkeys laden with incense, ebony, leopard skins and ivory.

After the fall of the Old Kingdom a cattle-owning people (the C-group) came into the area between the First and Second Cataracts and survived until the beginning of the 18th dynasty. They lived on the river bank in settlements of round huts of wood and grass and buried their dead beneath mounds of earth protected by circular walls of dry stone. They wore leather clothing; and bowls of black or brown ware, decorated with elaborate incised patterns often filled with white and later with coloured pigments, are characteristic of their pottery. Under the 11th dynasty Egypt turned its attention to the south again. An inscription near Aswan records the dispatch of ships to Wawat.

The first Pharaohs of the 12th dynasty, Amenemhet I and Senusret I, occupied Nubia as far as Semna, about 50 mi. S. of the Second Cataract. Communications with Egypt were protected by massive mud-brick forts. A trading post was built probably in the reign of Amenemhet II (1938–04 B.C.) at Kerma at the downstream end of the Dongola reach and 150 mi. S. of Semna. Kerma was probably the home of the chief of Cush. In graves excavated locally the principal occupant was laid in native fashion on a bed in a large low tumulus, while women and retainers, sometimes numbering hundreds, were buried alive with him. It is in any case most unlikely that G. A. Reisner was correct in thinking that it was the headquarters of successive Egyptian governors. The Egyptian statues found in these graves were presumably traded to the princes of Cush by Egyptian merchants during the Second Intermediate period (*c.* 1700 B.C.). At Kerma Egyptian craftsmen developed local industries. They made exquisitely fine burnished black-topped red pottery never again equalled, objects in faïence and quartz decorated with blue glaze and short copper swords with ivory hilts.

The southern group of Egyptian forts (Mirgissa, Shelfak, Uronarti and Semna) were probably built by Senusret III (*c.* 1887–50 B.C.) after a local rising. Until the 13th dynasty the level of the Nile flood was recorded at the forts at Semna. These levels show that the Nile was 26 ft. higher in flood then than it is today, and the rainfall must have been greater than now to provide grazing for the C-group cattle and to allow tribes to live on the west bank in what is now desert.

At some period subsequent to this, and probably connected with the expulsion of the Hyksos from Egypt, these forts were all destroyed by fire. Shards of C-group and Pan-grave pottery and stone axes copying bronze axes typical of the 17th dynasty have been found as far east as Agordat in Eritrea.

Ahmose I, the founder of the 18th dynasty, began the reoccupation of Nubia and built a temple at Buhen (Wadi Halfa); and his successor Tuthmosis I occupied the whole of Cush at least as far as 50 mi. S. of Abu Hamed, where he set up a boundary inscription. Cush was now incorporated in Egypt under a viceroy, whose first duty was to dispatch the tribute of Nubia to

Egypt. Informative representations of the arrival of this tribute in Egypt may be seen in tomb and temple at Luxor. Almost every Pharaoh founded a town or built one or more temples in Nubia from the local sandstone. The most splendid was that at Sulb dedicated to Amon and himself by Amenhotep III, who also built a smaller one at Seddenga for the worship of his queen Tiy. Other temples include those built by Hatshepsut at Buhen, Tuthmosis IV at Barkal, Amenhotep IV at Sesibi and Tutenkhamon at Faras and Kawa.

The construction of temples was continued under the 19th dynasty. Rameses II built two great rock-hewn temples to himself and his queen at Abu Simbel, and also temples or shrines at Gerf Hussein, Beit el-Wali, Wadi Sabu'a, Dirr, Ibrim, Faras and Aksha in lower Nubia; and his name occurs at Amara West, Sai, Kawa and Jebel Barkal in upper Nubia. In places, as at Kawa, he was not above erasing the name of the original builder and substituting his own. Seti I built the town wall at Amara West and probably built the original temple, to which various kings up to Rameses IX made additions. The known antiquities of Nubia under the New Kingdom are entirely Egyptian. They include at Aniba tombs built with pyramidal roofs like those at Deir el-Medina; and farther south inscriptions at Tangur, Dosha, Nauri, Tumbus and Kurgus.

From the period between 1100 and 750 B.C. nothing is known. Napata seems to have been still Egyptianized when in 750 B.C. Kashta set himself up there as king of Cush and conquered upper Egypt, founding the 25th dynasty. Reisner on slight evidence concluded that this dynasty was Libyan. Piankhi (*c.* 725 B.C.) included the rest of Egypt in his empire, and Shabaka his successor transferred the capital to Thebes and was known as king of Cush and Egypt. Piankhi built the great temple of Amon at Napata. The only monuments of Shabaka and Shebitku (Shabataka) in Nubia were their pyramids at Kurru. All the pyramids in this cemetery are now ruined, but the painted chambers of Tanutamon and his sister Kalhata are preserved. The burial chamber was excavated in rock below ground level, approached from the east by a stairway cut in the rock. The pyramid was built on ground level above the chamber and had a small mortuary chapel on its eastern face. (These chapels have all disappeared at Kurru and Nuri, but some of those at Meroe remain, and the designs with which they are decorated are of considerable interest and importance.) Taharka built more than one temple at Napata, carved four colossal figures out of the face of Jebel Barkal and built the largest pyramid of a new cemetery at Nuri. A disastrous clash with the Assyrians, who were armed with iron weapons and had recently included Palestine in their empire, led to the evacuation of Egypt by Taharka. His successor Tanutamon temporarily reoccupied upper Egypt, but was soon forced to abandon it (661 B.C.). The dynasty, however, continued to reign, first at Napata (with a palace at Meroe) and subsequently at Meroe, for about 1,000 years. The immediate successors of Tanutamon (Atlanersa, Senkamanseken, Anlaman, Aspalta, Amtalka and Malenakan, *c.* 653–538 B.C.) were able to construct pyramids and temples in the pure Egyptian style. A temple at Jebel Barkal was begun by Atlanersa and finished by Senkamanseken. The sun temple at Meroe (mentioned by Herodotus) was built by Aspalta; and the temple of Amon at Meroe was apparently built by Aspalta, Amtalka and Malenakan.

It is not unlikely that Meroe became the political capital soon after the loss of Egypt, although the kings were buried at the old religious capital of Napata up to Nastasen (*c.* 308 B.C.). The kingdom no doubt stretched as far as Sennar, where a scarab of Shabaka has been found, and Jebel Moya, where objects dating from Taharka to Aspalta and later were discovered; and it is reasonable to suppose that from Sennar it extended to the gold country of Beni Shangul, and from Jebel Moya to the Shilluk country on the upper White Nile.

In lower Nubia, there are the graffiti of Greek and Syrian mercenaries of Psammetichus II (594–589 B.C.) at Abu Simbel and Buhen in the reign of Aspalta. The Persians are said to have invaded Nubia under Cambyses in 522 B.C., but of this there is no evidence, although Nubians with carnelian-tipped arrows served in the army of Xerxes.

From his study of the royal cemeteries of Napata and Meroe, Reisner constructed a king list covering this period. Twenty kings and some of their queens were buried at Nuri, and all their names have been recovered. Forty-one rulers, who succeeded them, of whom 23 have been identified and 4 or 5 were queens, were buried from 300 B.C. in pyramids at Meroe. Reisner thought that during this later period there were two occasions when Napata was for a time independent of Meroe and its rulers buried in the earlier of the two groups of pyramids at Jebel Barkal. But there is some doubt about this, although the names of four kings did turn up at Kawa that were not found at Meroe. Ergamenes (225–200 B.C.) built the temple of Dakka and imported an Egyptian scribe to decorate his tomb chapel. He and his successors (who built six large pyramids) represent the most prosperous period of Meroe, when relations with Ptolemaic Egypt were friendly. But, cut off from Egypt, the Egyptian culture of the kingdom naturally degenerated. The Meroitic cursive script was invented before 200 B.C. When it was in general use, the knowledge of Egyptian and Egyptian scripts was quickly lost. Soon after 150 B.C. the Meroitic hieroglyphic script was invented for decorative inscriptions. The traditional offering scenes, which occur on the older pyramids, were now varied, giving them a distinctive Meroitic tinge. Degeneration was continuous until 45 B.C., when Queen Amanishakhete came to the throne. In 23 B.C. Gaius Petronius had invaded Napata with a Roman army as a result of frontier trouble in lower Nubia, when the statue of Augustus had been looted from Syene (modern Aswan). He destroyed Napata and, retiring, left a garrison at Ibrim. Queen Amanishakhete is buried in the second largest pyramid, in which Giuseppe Ferlini found a hoard of treasure. Her successors, King Natakamani and Queen Amanitere (15 B.C.–A.D. 15), repaired the temple of Amon at Meroe, built two temples at Naga, a temple at Wad Ban Naga and one at Amara East—the last two disappeared during the 19th century—and restored the great temple of Amon at Napata. The colossal royal statues on the temple site on Argo Island probably belong to this period. From this date degeneration was unchecked. The pyramids get gradually smaller, red brick eventually replacing stone in their construction. Red brick was much used for building in the latter centuries at Meroe, and in the last palace it was used in a crude imitation of a Roman bath.

Nubia entered the Iron Age during the Meroitic period. A few manufactured iron objects were imported in the 6th century B.C., but by 480 B.C. Nubia was still practically without iron. Pyramid foundation deposits first include iron about 360 B.C., when it probably began to be smelted at Meroe, although remaining a royal monopoly for several centuries. Meroitic pottery at Faras was predominantly wheel-made with some elaborate painted designs in the 2nd century A.D. To the same date belong fine ware, with repeated impressions of small stamps with designs such as the ankh, and imported barbotine cups. Handmade pottery including black ware with impressed designs filled with red or yellow pigment also occurred and was probably more frequent in the south. Artificial reservoirs in the island of Meroe, some of them associated with small temples (as at El-Musawwarat, Naga, Hardan, Awateib, Basa, Duanib and Umm Usuda) and in the Gezira were a feature of the Meroitic period and suggest decreasing rainfall.

The last record of the kings of Meroe is a demotic inscription from Philae recording an embassy of King Tekerideamani in A.D. 253. The knowledge of writing died out. There are no inscriptions on the walled group of temples at El-Musawwarat. The Blemmyes of the eastern desert (Beja) destroyed the Meroitic culture in lower Nubia; and Meroe itself was destroyed *c.* A.D. 350 by an expedition dispatched by Aeizanes, king of Axum, to crush a trade rival.

The Meroitic culture is followed in Nubia by one attributed by Reisner to the X-group. These may have been the Nobatae, a name possibly derived from confusion between Nuba and Napata (the "Red Nuba" of Aeizanes). They replace the northern kingdom of Napata, which had twice made itself independent of Meroe. The X-group tumulus is a direct descendant of the Meroitic pyra-

mid, and X-group pottery is in the Meroitic tradition. X-group cemeteries occur at Napata (Zuma and Tangāsi) and at Wawa, Sai Island, Firka, Atiri, Gemai, Adindan, Ballana, Kustul, Ibrim and Kalabsha. The royal cemeteries at Ballana and Kustul covered two centuries. The kings were buried with Meroitic insignia, and human beings and animals were sacrificed to accompany them. Grave goods included imported Byzantine objects; but no evidence of a written language was found. In the Meroe area graves contemporary with the X-group contain many large handmade mat-impressed pots and smaller bowls burnished and decorated with incisions near the rim. Large mound graves of this period are common as far south as Khartoum. The X-group have also been identified with the Blemmyes, who from the 3rd century had continually troubled Egypt and by the 5th century were established at Talmis, combining with the Nobatae to raid upper Egypt. They were compelled by Florus in A.D. 452 to keep the peace but were allowed to visit the temple of Philae and to borrow the statue of Isis.

About A.D. 540 the Nobatae were converted to Christianity, and shortly after that, at Kalabsha, their king Silko, now a Christian, records his defeat of the Blemmyes and of the upper Nobatae (of Napata?). After this the capital of the Nobatae seems to have been at Pachoras (Faras), until they were amalgamated with Makuria in the single Christian kingdom of Dongola. South of that was the kingdom of Alwa with its capital at Soba near Khartoum. Alwa had become Christian in A.D. 580.

In A.D 652 a Moslem army from Egypt captured Dongola and compelled the kingdom to pay tribute to Egypt. Arabic historians often mention relations between Egypt and Nubia; but the kingdom of Dongola remained Christian until the 14th century, when it was overrun by Mameluke armies from Egypt. The stone castles of Nubia (Sai, Khandag, Bakhit, etc.), which show crusader influence, date from the unsettled period before the final fall of Dongola. Soba survived for another two centuries, and then gave place to the Moslem Fung kingdom of Sennar.

The churches of Nubia were small, when not adaptations of heathen temples. Some were built of stone masonry, but brickwork was commoner. In the north there were two principal types, basilican and domed, and mud brick was usual; whereas in Dongola a typical church had red brick walls with a roof supported by four granite monolith columns with separate granite capitals. Mural paintings covered the walls. Little now remains of any of these churches except one or two small mud-brick buildings in out-of-the-way places (*e.g.*, the church of Abdelgadir near Wadi Halfa), and the ugly atypical fortified church at Old Dongola, which owes its preservation to its conversion to a mosque in the 14th century. In Dongola in the Christian period graves frequently had a rectangular stone superstructure with tombstones inscribed with Greek letters and either Greek or Coptic inscriptions; and circular stone cairn graves of the same period also occur as far south as Khartoum and west across northern Kordofan. Rare inscriptions of Old Nubian in Greek characters have also been found. Pottery in the Meroitic tradition continued in the Christian period, the best being a thin ware coated with a white slip and decorated with designs in sepia.

NUBIAN LANGUAGE AND WRITING. Nubian is the name given to the language of the Barabra or Nubians in the Nile valley, between Merawi, a few miles below the ancient Napata, and the First Cataract at Aswan. It has there two principal dialects, the Mahass-Fadija being spoken in the central portion, from a little south of the Third Cataract, and the Dongola-Kenzi at either end of the region; the speech of these Barabra is now pervaded with Arabic words.

Moreover, in the hills of Kordofan dialects of Nubian are spoken by many small communities among other languages only remotely akin, and are found westward as far as eastern Darfur. Nubian is without gender, agglutinative and mainly monosyllabic. Nubian roots are traceable in Ethiopian geographical names handed down by classical authors; but perhaps the chief interest of the language is its use in the writings of the Nubian Church.

Probably to fortify their independence against Moslem encroachment, the Nubians adapted the Greek alphabet, with necessary additions from the Coptic and perhaps the Meroitic alphabets, to the purpose of writing their own language. The rare examples of Nubian writing that have been discovered, besides graffiti and two legal documents, comprise portions of a lectionary, homilies and edifying narratives, obviously translated from Greek and not from Coptic. The earliest dates from the end of the 8th century, the latest from the beginning of the 14th.

NUBIANS: *see* BARABRA.

ÑUBLE, a province of central Chile, bounded north by Maule and Linares, east by Argentina, south by Concepción and Bío-Bío and west by Concepción and the Pacific ocean. Area, 5,487 sq.mi., according to the redefinition of the limits of the province in the 1930s; pop. (1952 census) 251,607. The province lies partly in the great central valley of Chile, noted for its fine climate and fertility, partly on the western slopes of the Andes and partly in the coast ranges. The Itata river, which forms a part of the southwestern boundary, and its principal tributary, the Ñuble, form the drainage system of the province. Agriculture, including viticulture, and grazing are the principal industries. The state railway from Santiago to the southern provinces passes through Ñuble, from north-northeast to south-southwest, and sends off a branch from Búlnes west to Tomé on the Bay of Concepción. The capital is Chillán, pop. (1952) 52,576; other important towns are San Carlos and Búlnes. The hot baths of Chillán (Termas de Chillán), in the eastern part of the province on the slope of the volcano of that name, are popular in Chile.

NUCERIA, an ancient city, Magna Graecia, on the west coast of Italy near the modern Nocera Tirinese. It was a small city in an important strategic position between two rivers, the valley of one of which afforded a route to the valley of the Crathis, but had no harbour.

NUCLEUS, the term used in biology to designate one of the two main structural components of the living cell, the other component being the cytoplasm. Usually the nucleus is a spherical or ovoid vesicle. It derives its importance fundamentally from the presence of the hereditary materials (chromosomes, genes, *q.v.*) which it encloses and keeps separated from the cytoplasm by its surrounding membrane, except at the time of cell division (*see* CYTOLOGY). It is present in the cells of practically all animals and plants except the bacteria and the blue-green algae. In the latter

the hereditary materials appear to be scattered in the cytoplasm. (C. W. M.)

NUCLEUS. The nucleus of the atom is a particle of very small radius and exceedingly great density located at the centre of the atom. All but a negligible fraction of the atomic mass is concentrated in the nucleus. At the same time the size of the nucleus is more than 10,000 times smaller than the size of the atom. The approximate size of the atom, in turn, is a few billionths of an inch (*i.e.*, one, two or three times 10^{-8} cm.). The nucleus carries a positive electric charge which is an integral multiple of the elementary charge (whose magnitude is 4.8×10^{-10} electrostatic units).

DESCRIPTION AND HISTORY

The first clear evidence about the internal structure of the atom was obtained by E. Rutherford in 1911. He was led by his experiments to assume that atoms consist of a nucleus, as described above, and a number of electrons. These electrons carry a negative elementary charge (of magnitude 4.8×10^{-10} electrostatic units) and they have a mass which is a small fraction of the atomic mass. (The fraction representing the total weight of the electrons in the atom to the atomic weight is $\frac{1}{1,840}$ in the case of hydrogen, the lightest element, or $\frac{1}{4,760}$ in the case of uranium, the heaviest element.) The number of electrons in the atom is equal to the number of positive charges the nucleus carries so that the atom as a whole is neutral. The atomic number and the designation Z are used for either of these quantities. All chemical and most physical properties of atoms are determined, apart from exceedingly small variations, by the atomic number, Z. Atoms having a given Z value form an atomic species. For example, if the nucleus has one unit of charge and one electron is present, we have a hydrogen atom. As further examples, nuclei with 2, 6, 26, 79 and 92 charges may be mentioned; the corresponding atoms have 2, 6, 26, 79 and 92 electrons and the atomic species are helium, carbon, iron, gold and uranium, respectively. The chemical transformations, the appearance and common behaviour of materials built from the atoms depend only on the configuration of the electrons. This is influenced, in turn, only by the nuclear charge and is practically independent of other properties of the nucleus. The atomic properties are discussed in detail in ATOM. In the following the interest is in the central particle; *i.e.*, the nucleus.

Formerly it was believed that atoms were immutable entities. This statement did not imply that the configuration of the electrons in the atoms could not change. It was, indeed, soon recognized that chemical changes are caused by the rearrangement of the electrons. As long as the charge of the nucleus has remained the same, however, the atom is considered unchanged. No matter what deformation occurs in the electron arrangement, it will always return to the normal configuration as soon as the disturbing force is removed.

In 1896 H. A. Becquerel noticed that uranium emits unusual radiations, designated as radioactivity. In the next few years the work of Marie and Pierre Curie, E. Rutherford, F. Soddy and others led to the recognition that the phenomenon had to be explained by a spontaneous, permanent and intrinsic change of the atomic species (*see* RADIOACTIVITY, NATURAL). In uranium this is brought about by the emission of a particle from the nucleus which carries away two units of positive charge and which is called an α-particle (alpha particle). Thus the uranium nucleus, originally containing 92 units of charge, disintegrates into a nucleus containing 90 units of charge. This nuclear charge characterizes a different atomic species, thorium. These phenomena will be discussed later in the section on α-decay. The emitted particle has a very high velocity, only 20 times smaller than the greatest possible velocity, that of light. Thus a much larger kinetic energy is concentrated on the α-particle than was ever before found on a body of comparable mass. Actually the α-particle is the nucleus of the helium atom.

In the hands of Rutherford these α-particles became powerful tools in exploring the interior of the atoms. In experiments published in 1911 Rutherford showed that the majority of particles pass through thin (of the order of $\frac{1}{10,000}$ in.) but solid foils without being deflected. A few α-particles were scattered through quite large angles. These observations could be explained by assuming that the α-particles had collided with heavy, charged particles, the atomic nuclei. The greater number of small deviations were the result of "distant" collisions; *i.e.*, of forces acting between two particles which did not approach closely. The large deflections were caused by the larger force of two charged particles more nearly in contact. In order to account for the large number of undeviated particles, the nucleus had to be given a radius small compared with that of the atom. Rutherford assumed that the charge of the nucleus is positive and that the remainder of the atom consists of the light negatively charged electrons.

Collisions between the α-particles and the electrons are much more frequent than the noticeable collisions between α-particles and nuclei, but because of the small mass of the electron these collisions do not result in an observable deflection of the α-particles. Rather they cause a gradual loss of energy of the α-particles. The distance through which the particle travels before it loses all of its available energy is called the range of the particle. The range depends, in general, on the initial energy of the particle, on its charge, its mass and on the density of the electrons with which it can collide. The hypotheses which Rutherford made to explain his experiments have been fully verified by the great body of experimental and theoretical studies of atomic and nuclear physics.

In 1919 Rutherford observed that nitrogen bombarded by α-particles emitted a new product. This turned out to be a nucleus of the hydrogen atom, which is called a proton, carries a single unit of positive charge and is the simplest of all atomic nuclei. The reaction was produced by a close collision of the α-particle and the nucleus of the nitrogen atom, which carries seven positive charge units. The α-particle attached itself to the nitrogen nucleus, producing a so-called compound nucleus ˙ high internal energy. From this structure the fast proton is subsequently emitted. The actual time for the emission is an exceedingly small fraction of a second.

The result of this nuclear reaction is that the nitrogen nucleus, having absorbed the α-particle with two positive charges and having emitted a proton carrying only one positive charge, has now turned into an oxygen nucleus. In this way Rutherford's experiments accomplished the transmutation of nitrogen atoms into oxygen atoms. At the same time the bombarding helium nuclei were transformed into hydrogen nuclei. In the process the kinetic energy of the system had also changed. The final particles contained less energy than the original helium nuclei.

Rutherford's experiments also explained why the transmutation of elements could not be accomplished by the previously used methods of chemistry and physics. Artificial change of nuclear charge requires a nuclear reaction induced by the close contact of two atomic nuclei. Because of the strong electrostatic repulsion of the positively charged nuclei, sufficiently close contacts can occur only if the nuclei approach each other with a high initial velocity. The required high velocities do not occur in chemical processes and thus the endeavour of the alchemists to transmute elements by chemical means was doomed to failure. As soon as methods and techniques specialized in the production and observation of high-velocity particles were developed, transmutation of atoms could be observed.

The study of atomic nuclei remained a field sharply separated from the investigation of atoms and from other branches of chemistry and physics. The reason for this is twofold. First, the details of nuclear structure influence the properties of the atom as a whole and the properties of matter in bulk to an exceedingly small extent.

Thus the study of the structure of matter could proceed without detailed knowledge of the atomic nucleus. Second, the internal behaviour of nuclei can be influenced only when energy is present in very high concentrations. The required high energies are carried by α-particles such as were used in Rutherford's experiments. In chemical and most physical processes, however, the concentration of energy is not high enough to influence the behaviour of

nuclei to a noticeable extent. Thus, nuclear processes occur, so to speak, in a world of their own and unusual special methods must be devised to penetrate into this world.

For several years following the publication of these first experiments on nuclear transmutations, radioactive materials occurring in nature remained the only source of high-energy particles. The study of nuclear processes was handicapped by the relatively small number of particles these sources made available to the experimenter. Observations had to be made over quite long periods of time and results had to be based on the observations of relatively few processes. Nuclear scientists therefore made every effort to produce similarly fast particles by artificial means. The first machine to do this was the "cascade transformer" of C. C. Lauritsen, H. Crane and others which was completed in 1928. This was followed by the machine of J. D. Cockcroft and E. T. S. Walton in 1929 and the "electrostatic generator" of R. J. Van de Graaff in 1931. These machines are called "linear accelerators," a term derived from their common fundamental principle. The charged particles, such as protons or α-particles, are introduced at one end of a cylinder containing a very strong and extended electric field. As the particles move through the field they are continuously accelerated. In order that no energy should be lost by collisions with atoms, the cylinder is evacuated. The fundamental principle of these machines is the method by which the necessary electric fields are obtained.

Another principle was used in the cyclotron (E. O. Lawrence, 1932, *see* CYCLOTRON). In this machine particles are confined by a magnetic field to a spiral-shaped orbit and accelerating electric fields are repeatedly applied while the particles are moving along this orbit.

The betatron (D. W. Kerst, 1940) is similar to the cyclotron in that the particles are confined by a variable magnetic field. The acceleration, however, is accomplished by the principle of induction. According to this principle, increase of current in one coil induces an opposite current in a coaxial coil. In the betatron a change of current in a coil causes an acceleration of electrons which do not move in a second coil but rather in free space. An important practical difference between the cyclotron and the betatron is that the former is used to accelerate atomic nuclei while the latter accelerates electrons.

After 1945 improvements in all these machines became possible through closer control of the electromagnetic fields which are used to confine and accelerate the particles. In some of these, electrons or nuclei are accelerated in straight lines (L. Alvarez, acceleration of protons, 1946; H. H. Hansen, acceleration of electrons, 1948). Acceleration is achieved by the continuous action of an accelerating field which moves along with the accelerated particle. A machine of the cyclotron type is the synchrotron (E. M. McMillan, 1945) for the acceleration of electrons. In this machine electrons are kept in a circular orbit by a changing magnetic field and the acceleration is accomplished by repeated application of an electric field near a certain point in the orbit of the electrons. By a close correlation between the changing magnetic field and the period in which repeated accelerations are applied (synchrocyclotron), it became possible to accelerate nuclei to very high energies; the highest energy reached in the early 1950s was in the cosmotron at Brookhaven National laboratory, Upton, N.Y. The energy obtained was approximately 500 times higher than the energy of the α-particles of uranium.

These high-voltage machines were capable of producing a considerable number of nuclear reactions which were, in principle, analogous to the reaction studied by Rutherford in 1919. In some of these reactions energy was released, in others energy was absorbed, but in all cases the energy changes were great compared with the energy changes involved in chemical reactions.

In 1932 Irène Curie and F. Joliot discovered that by nuclear reactions radioactive nuclei can be produced. In their experiments they used, like Rutherford, α-particles. With these they bombarded boron atoms, whose nuclei carry five elementary charges. The resultant nucleus contained two more charges and was therefore a sevenfold charged nucleus, or a nitrogen nucleus. This nitrogen nucleus differed from all nitrogen nuclei found in nature in that it emitted a particle called the positron. This particle is similar in all respects to the electron discussed above except that it carries a positive rather than a negative charge. In the following years a great number of radioactive nuclei were produced. Many of these emit positive electrons like the nitrogen nucleus just described, others emit the more common negative electrons. Radioactivities of this type are called β-activities, and the positive or negative particles emitted by the nuclei are called β-rays. (*See* RADIOACTIVITY, ARTIFICIAL.) Actually β-radioactivity was discovered practically simultaneously with α-activity, but up to 1932 only a few naturally occurring β-activities were known. All elements can be obtained in a radioactive form.

Considering the great energy release which was frequently encountered in nuclear reactions, the question arose whether it would be possible to utilize this energy. This was not possible for the following reason: in order to release nuclear energy one had to start with highly energetic particles. Most of these particles, if they impinge on a piece of matter, will not get close to nuclei and will not produce reactions but will instead squander their energy by making collisions with light electrons. In this way the originally concentrated energy of the particles will ultimately be transformed into heat. Only a small fraction, less than $\frac{1}{100}$ of 1%, of the originally fast particles get close enough to an atomic nucleus to produce a nuclear reaction. In these rare instances the nuclear energy may be greater, sometimes even 10 or 100 times greater, than the energy of the impinging particle but since these processes occur only rarely, the net gain in energy is small. The bombardment of a piece of material by a stream of energetic, charged particles will thus produce a heating of the bombarded sample which is only slightly increased by the reactions occurring in the sample. Considering the exceedingly high cost of the original source of energy, the actual slight energy production could not be considered as a practical source of power.

A great number of additional nuclear transformations became possible in 1932 when J. Chadwick discovered the neutron (*q.v.*). This particle has a mass which is very slightly in excess of the mass of the hydrogen nucleus, or proton. In contrast to the proton, however, it carries no charge and is the only known nuclear particle that is neutral. Consequently the neutron does not attract any electrons and does not have the property of other nuclei of surrounding itself with an extended electron configuration. Thus one of the striking properties of the neutron is that it may penetrate practically freely through several inches of solid materials, being influenced in its path only whenever it touches an atomic nucleus.

The fact that neutrons are not charged gives rise to a second important consequence. This is that neutrons can approach any nucleus without being repelled by the charge on the nucleus. Therefore a neutron need not have a high velocity, or a high energy, in order to cause a nuclear reaction. Unlike the charged particles the neutrons can approach with equal ease nuclei of small charge like nitrogen nuclei or nuclei of big charge like gold or uranium. This fact was utilized by many investigators following 1932 to explore a great number of nuclear reactions. E. Fermi and his collaborators in Rome, It., were by far the most active and successful workers in the field.

The fact that a neutron need not possess energy in order to approach a nucleus reopens the question whether nuclear reactions can be used to produce useful power. Unfortunately neutrons could be produced only in reactions in which fast particles were involved. A typical example is the reaction described above in which a fast α-particle impinges on a boron nucleus and forms a radioactive nitrogen nucleus. In this reaction a neutron is also ejected. In the final analysis this neutron represents as costly an investment of energy as the fast particle itself and practical power production seems to remain unattainable.

Actual utilization of nuclear energy on a big scale became a concrete possibility at the end of 1938 when O. Hahn and F. Strassmann in Berlin, Ger., discovered uranium fission. These investigators made a careful study of the artificial radioactive substances which were obtained when neutrons impinged on the uranium nucleus. Fermi and his collaborators had noticed several

years previously that when a uranium nucleus is hit by a neutron, a variety of radioactive substances are produced. At that time the reaction was not understood. Hahn and Strassmann specifically identified barium in the bombarded uranium target they were studying. To explain the presence of this much lighter element a very violent reaction must have occurred in the uranium nucleus. It was concluded that the nucleus of uranium, because of its large size and the repulsion of its many positive charges, is on the verge of disintegration. The additional energy brought into the nucleus by the neutron is sufficient to make the nucleus break apart. The process is called the fission of the nucleus. The electrostatic repulsion of the product nuclei at the instant of fission makes them fly apart with great velocity and an amount of energy, unusually large even in the scale of nuclear energies. This splitting of the uranium nucleus can occur in a number of ways, giving a variety of pairs of disintegration products. These nuclei, which are unstable and disintegrate by β-particle emission, add to the energy liberated by the reaction. The above conclusion was reached and verified experimentally by several scientists. The first of these were O. Frisch and L. Meitner in Copenhagen, Den.

It was further guessed that neutrons are liberated in fission making possible a chain reaction. If, for instance, 2 neutrons were emitted, these could react with uranium nuclei producing 4 neutrons. These would multiply to 8, then to 16 and so on. In a few steps the number of neutrons will become extremely large, the reaction is accelerated and energy is liberated at an ultimately explosive rate. Later in 1939 L. Szilard, F. Joliot and others experimentally verified the liberation of a sufficient number of neutrons. This was the necessary proof of the feasibility of a chain reaction and work was begun on producing such a reaction. To control the chain reaction means, first, to allow neutrons to multiply and, subsequently, to strike a balance of neutron production and neutron absorption so that the number of neutrons just maintains itself and does not grow to explosive proportions. This was first achieved under the guidance of E. Fermi on Dec. 2, 1942, at The University of Chicago. Subsequently, many additional nuclear reactors were built, all based on the principle explained above. Some of these reactors liberate considerable amounts of energy and progress has been made toward transforming this energy into useful power.

In 1942 the development of the explosive aspects of the nuclear chain reaction was undertaken by a group headed by J. R. Oppenheimer. On July 16, 1945, the first so-called "atomic" bomb was exploded in the desert near Alamogordo, N.M. Afterward, two atomic bombs were exploded over Japan. In the following years numerous tests of atomic bombs were carried out by U.S. scientists in the Pacific and Nevada; by Russian workers; and by a British group in Australia. Later, atomic explosions based on the building up of light nuclei came to be frequently discussed and were reported to have been achieved by the U.S. and the U.S.S.R. The nuclear reaction involved here is that of the fusion of small nuclei into bigger units rather than a fission of the heaviest nuclei into two parts. The fusion reaction is most easy if hydrogen nuclei are involved which carry only a single unit of charge and if the temperature in the reaction is extremely high so that charged particles can approach each other. The designations "hydrogen bomb" and "thermonuclear bomb" refer to the facts just mentioned.

DETECTION OF NUCLEAR PROCESSES

When a nuclear reactor produces energy, and particularly when an atomic bomb explodes, the effects of nuclear processes are very noticeable, even without elaborate detecting devices. The energy released appears in the form of heat or, in the case of the atomic bomb, partly in the form of motion of air masses, light and other radiations. Some of these radiations are capable of ionizing and rearranging individual molecules. If that happens extensively in living tissue, radioactive burns result and the tissue may suffer serious damage.

In the development of nuclear science, both past and future, observations of an individual process are more important than the observation of the impressive phenomena that accompany the large-scale release of nuclear energy. Individual nuclear processes are observable, in fact, for two reasons. One is that particles participating in nuclear reactions as a rule have exceptionally high energy and are, for that reason alone, noticeable among the myriads of atoms of comparable size but much lower energy through which these nuclear fragments move. Another reason is that the effects of these fast particles can be amplified. Thus, while the effects are usually too small for direct observation, they can easily be detected by the use of suitable apparatus.

Any of the charged particles or electromagnetic radiations connected with nuclear reactions can produce an effect in a photographic plate similar to that of light. This effect essentially consists of producing disturbed grains in the photographic plate. These disturbed grains then are developed in subsequent chemical processes so that a deposition of metal big enough to be visible to the naked eye or under the microscope is formed at the position of the disturbed grain. The process of developing plays in this special instance the role of amplifying the original effect of the nuclear radiation. The characteristic property of nuclear fragments is their high energy by which they can activate a number of grains lying along a straight line. Use of photographic plates of various sensitivities and detailed study of the density of the excited grain and of the length of the track make it possible to recognize the kind and energy of the particles that cause the track. It is interesting to note that the blackening of a photographic plate by the faintly radioactive pitchblende started H. A. Becquerel in 1896 on the first investigation of a nuclear process. Half a century later the finer methods of observation described above made photographic plates most valuable tools of research in nuclear physics.

The Wilson cloud chamber, devised by C. T. R. Wilson in 1912, is a piece of apparatus especially designed for the detection of charged nuclear fragments. (*See* WILSON CLOUD CHAMBER.) In its general principle of action it is similar to the photographic plate. In the latter nuclear radiations give rise to disturbed centres in the photographic emulsion. In the cloud chamber, α-rays or other fast charged particles form ions, *i.e.*, charged atoms or molecules, along their paths. The process of developing is replaced in the cloud chamber by a process of condensation. The cloud chamber contains a vapour, usually water vapour, which is maintained at a temperature just above the condensation temperature. Following the passage of nuclear particles, the cloud chamber is expanded and by this process the vapour contained in it is cooled so that condensation sets in. The water molecules are attracted to the ions which mark the trail of the fast particle. Thus a set of droplets is formed making the path of the particle visible. The process of amplification in this case is the growth of the droplets around the ions.

There is one method of observing nuclear particles without the use of an amplifying mechanism. This is the method of observing fluorescence or scintillations. Along the path of the fast particles atoms and molecules are not only ionized but also disturbed to various degrees. These atoms and molecules return to their normal states and in doing so emit light. The light effects produced in a suitable fluorescing material by a single α-particle are actually visible to the naked eye. These individual processes are called "scintillations." It is remarkable that in a scintillation the effects of a single nuclear process can be seen directly without the use of intervening equipment. This is possible because of the great amount of energy of the α-particle and the extremely great sensitivity of the human eye. As a practical means of studying nuclear reactions the observations of scintillations were of great importance around 1920. The scintillation method, combined with sensitive apparatus for the detection and amplification of light, again proved of great usefulness.

Purely electric apparatus may be used to detect nuclear particles. In these detecting devices the ions produced by the nuclear particles are set in motion by electric fields. This can be done in a variety of ways. The field may be chosen relatively small and its effect may be merely to collect the ions on an electrode. In this case the resulting current is always so small that in order to observe it one has to amplify the current. This is done by

equipment similar to the common radio receiving sets. If stronger fields are used to move the original ions, these ions may acquire enough energy to knock electrons out of other atoms or molecules, thereby producing more ions. In this way some amplification takes place immediately. This initial amplification might become so considerable as to develop into an actual discharge, as happens in the Geiger-Müller counter.

Electric detecting devices are particularly useful because of their great flexibility. They can be set in a way to become selectively sensitive to a specific particle. When arranged and coupled in an appropriate manner these electric devices can count particles of a specified energy. They can be used to study the coincidence in time of two processes. Therefore they are capable of furnishing the important information whether two nuclear particles have been released in the same process. Finally, by purely automatic methods one can keep records of the number of various kinds of particles that have passed through a counter.

While electric fields are most frequently used in collecting the ionized atoms along the path of a nuclear fragment, magnetic fields are frequently used to determine the exact speed and energy of the fragments. Simultaneous use of electric and magnetic fields gives a further piece of important information, namely the mass of the particle with which we are dealing. This latter piece of equipment, the mass spectrograph, is not, properly speaking, an instrument of detection, but a precision instrument, designed to measure one of the basic properties of nuclei.

Among the nuclear fragments there is one which cannot be observed directly by any of the methods described above. This particle is the neutron. The detection of neutrons proceeds as a rule in an indirect way. The collisions of the neutron with atomic nuclei of various kinds produce fast, charged particles or electromagnetic radiation and either of these may be detected by one of the many methods which have been described.

CONSTITUENTS OF THE NUCLEUS

According to ideas in the 1950s the nuclei are built from two simpler particles, the neutrons and the protons. These two particles, which are considered the building blocks of nuclei, are also called nucleons. As has been mentioned above the protons carry the elementary charge (4.8×10^{-10} electrostatic units), whereas the neutrons do not carry a charge. The masses of the proton and neutron are 1.6730×10^{-24} and 1.6752×10^{-24} g., respectively. In nuclear physics it is customary to introduce a special unit of mass, 1.6604×10^{-24} g. This mass is actually $\frac{1}{16}$ of the mass of the most abundant stable variety of the oxygen nucleus.

In general a nucleus contains Z protons and N neutrons, where Z and N are integer numbers. The charge of the nucleus is Z times the elementary charge. It was pointed out in the first section that the atomic species is determined by Z alone. Nuclei of the same atomic species may, however, contain various numbers of neutrons. It is found, for instance, that hydrogen with Z equal to one may have N equal to zero, one or two. Such members of the same atomic species with different N values are called isotopes. It is customary to differentiate isotopes by a superscript equal to $Z+N$ following the chemical symbol of an atomic species. Thus the isotopes of hydrogen are H^1, H^2 and H^3. Frequently the Z value is indicated by a leading subscript, *i.e.*, ${}_1H^2$, but this subscript may be omitted since the chemical symbol also indicates the Z value. As further examples, the isotopes of oxygen may be mentioned, where Z equals 8 and N may be 6, 7, 8, 9, 10 or 11, and isotopes of uranium, in which Z is equal to 92 and N may have any value from 135 to 148. Further isotopes are being discovered.

Because isotopes have the same Z value and hence the same chemical behaviour, it is extremely difficult to separate them. Methods depending on the difference in mass, or N value, have been developed (*see* ISOTOPES) but these are much more expensive and less efficient than chemical processes.

The total number, $Z+N$, of particles in the nucleus is called the mass number and is designated by A. The actual mass of a nucleus differs by a small amount from the sum of the masses of its protons and neutrons. It should be noticed that while the charge of the nucleus is exactly Z times the elementary charge, the mass of the nucleus is not obtainable in a similarly simple manner. A more detailed discussion of this remarkable fact will be given in the next section.

Among nuclei which contain few particles it is often found that the values of Z and N are nearly the same. Some of the most abundant isotopes found in nature such as ${}_2He^4$, ${}_6C^{12}$, ${}_7N^{14}$ and ${}_8O^{16}$ exhibit this phenomenon. As one goes to heavier nuclei the number of neutrons increases faster than the number of protons in the nucleus. In uranium, for instance, the most abundant isotope has 54 more neutrons than protons.

There is no consistent theory as to the forces which hold neutrons and protons together in the nucleus. In order to assure stability it must be assumed that these forces are in the main attractive. In the following there will be occasion to discuss some properties of these forces. Here it is sufficient to mention that these forces have extremely short range. The forces between neutrons and protons become negligible if the distance exceeds the order of magnitude of the nuclear diameter.

In addition to nucleons, that is, protons or neutrons, other particles are known to be emitted in nuclear transformations. Among these the α-particles and β-particles should be mentioned. These occur in the great majority of spontaneous nuclear disintegrations (spontaneous radioactivity) and historically they were the first to be observed. Nevertheless they are not considered to be primary constituents. In fact the α-particle may be considered to consist in turn of two protons and two neutrons, having a charge of two and a mass of approximately four units. The fact that α-particles so often occur as the product of nuclear disintegrations is caused by the extraordinary stability of this particular arrangement of protons and neutrons.

The reason β-particles, which are either negative or positive electrons, are not considered regular constituents of the nucleus is more involved. According to the basic theory of atomic physics one cannot confine a particle of small mass, such as the electron, in a region as small as the nuclear radius without giving it an energy greater than the nuclear energy. In other words, the paradox occurs that the electron, if thus confined, must have an energy great enough to permit the particle to escape.

Nuclear theory describes the emission of negative or positive electrons as a process in which the negative or positive electron is created at the moment of emission. This concept becomes plausible when it is added that both the creation and annihilation of pairs of positive and negative electrons have been observed outside of nuclei. Thus these electrons cannot be considered immutable. Any attempt to assume the presence of these electron pairs in the nucleus leads to a complicated picture where any number of positive and negative pairs may be assumed to be present. In the accepted theory and for the following discussion, the presence of positive and negative electrons is ignored. Attention is confined to a model composed of neutrons and protons.

NUCLEAR ENERGY

Observations of natural and artificial nuclear transmutations prove that the energies involved in nuclear reactions are of great magnitude. In fact, these energies are larger by a factor of 1,000,000 than the energies involved in chemical reactions. The neutrons and protons are bound together in nuclei about 1,000,000 times more strongly than atoms are bound together in chemical compounds or in the most stable crystals known. This great energy is closely associated with a general law of atomic physics according to which the binding or localization of a particle in a smaller region necessarily requires a greater binding energy.

The most direct way to obtain nuclear binding energies is the study of nuclear reactions. Thus if one nucleus of the lithium isotope Li^6 is bombarded by a deuteron, the nucleus of heavy hydrogen, H^2, two nuclei of helium are obtained. The reaction may be written similarly to an equation in chemistry:

$$Li^6+H^2\rightarrow 2He^4.$$

In order to produce the reaction the bombarding deuterons must contain enough kinetic energy to approach the lithium nucleus in spite of the electrostatic or coulomb repulsion of the two

particles. The required energy is a few hundred thousand electron volts. (The electron volt, abbreviated ev, is the usual unit of energy in atomic and nuclear physics. It is the energy an elementary charge gains when it falls through a potential of one volt. One electron volt equals 1.6×10^{-12} ergs or approximately 1.5×10^{-18} of the work done in lifting a pound weight to a height of one inch.) The energy contained in the two resulting α-particles is equal to the energy of the deuteron plus an additional 22.17 million electron volts (Mev). This difference in energy arises from the stronger binding of the neutrons and protons when combined in two helium nuclei, rather than in a lithium nucleus and a deuteron. The total binding energy of the helium nucleus compared with four free particles is 28 Mev or 7 Mev per particle. This is close to the largest binding energy per particle in any nucleus. The binding energy is a negative energy in the sense that one has to add energy to decompose a helium nucleus into neutrons and protons.

A determination of nuclear binding energies is often complicated because of the fact that the reaction products have an excess internal energy, or excitation. The energy of excitation is retained by the nucleus for a very short time and then is emitted as γ-rays. These γ-rays are electromagnetic waves and are similar to light. There are, however, significant differences: γ-rays are emitted by nuclei, light is emitted by atoms; γ-rays carry away in a single process about 1,000,000 times more energy than light does; considered as a wave process, γ-rays have approximately 1,000,000 times shorter wave length than light. The most striking difference is that γ-rays are invisible though they cause physiological changes which are not specifically localized in the eye.

These γ-rays can enter actively into nuclear reactions. The absorption of γ-rays may excite a nucleus and furnish enough energy to cause the nucleus to disintegrate. The most common result of such a disintegration is the splitting off of a neutron. If a nucleus of deuterium is bombarded by γ-rays containing an energy of 2.2 Mev or more, the nucleus may disintegrate into a neutron and a proton, $H^2+\gamma\rightarrow n^1+H^1$. Since the energy of the γ-rays can be measured independently, this type of reaction furnishes an additional method of obtaining binding energies. The reaction just described indicates a binding energy of 2.2 Mev for the deuteron.

The great amount of energy liberated in nuclear reactions makes it possible to use a method of energy measurement for nuclei which in other cases is impractical. The method of energy determination is based on a law obtained from theoretical arguments by Albert Einstein in 1905: whenever the energy of a system is changed, the mass is changed by a corresponding amount.

Energy changes in familiar objects are accompanied by exceedingly small changes in mass and, thus, the mass change postulated by Einstein was beyond the powers of observation. As an example consider a large spring weighing, say, 5 lb. and suppose a force of 3,000 lb. compresses the spring 6 in. The change of mass is $10^{-12}\%$ of the mass of the spring. In chemical reactions the change in mass is a few orders of magnitude larger, but still too small for observation. Let us suppose a gram molecular weight of pyrite (FeS) (87.9 g.) is formed from iron and sulphur. The change in mass, calculated from the heat energy released in the reaction, is 10.7×10^{-10} g. This corresponds to one billionth of 1% change in mass.

If now a neutron and a proton are considered as combining to form a deuteron, the energy liberated is 2.18 Mev per deuteron. This represents a difference in mass between the two particles when free and when combined in a deuteron of about a tenth of 1%. This difference is large enough to be measured accurately. Therefore, by reversing this procedure and measuring the difference in mass of separated and combined particles, the binding energy of the particles can be calculated. Thus the statement of the previous section, that the mass of a nucleus is not equal to the mass of the constituent particles, is explained by the mass change accompanying the energy change.

The relationship between mass and energy changes stated by Einstein may be written:

$$\Delta E=\Delta m\, c^2$$

where ΔE is the energy change expressed in ergs, Δm is the accompanying change of mass given in grams and c is light velocity, equal to 3×10^{10} cm. per second. If the energy is measured in million electron volts (Mev) and the mass is measured in the usual nuclear mass units ($\frac{1}{16}$ of the mass of the oxygen atom) then the above relation gives a change of 1/931 nuclear mass units for every Mev change in energy.

As an example, we consider the mass of deuterium or heavy hydrogen, H^2, which is composed of a proton, H^1, and a neutron, n. The masses in nuclear mass units are:

$$\text{Mass of } H^2 = 2.01412,$$
$$\text{Mass of } H^1 = 1.00754,$$
$$\text{Mass of } n = 1.00894.$$

$\Delta m=$mass of H^1+mass of $n-$mass of $H^2=0.00236$. To convert this mass difference into a binding energy, we multiply by 931 and obtain 2.2 Mev.

The choice of the unit of mass as $\frac{1}{16}$ of O^{16} can now be clarified. On this basis, the masses of other atoms are nearly integer numbers because in O^{16} the binding energy of the nucleons is similar to the binding energy in most other nuclei. Thus the mass of the nucleons in O^{16} is similar to the mass of the nucleons in other nuclei and if the total mass of O^{16} is set equal to the total number of nucleons contained in that nucleus, that is to 16, masses of other nuclei will be close to integer numbers.

FURTHER PROPERTIES OF NUCLEI

The particles that compose the nuclei, *i.e.*, the protons and neutrons, have a property which in a subtle way influences nuclear structure. These particles behave as though they were rotating around their own axes. There is no reason to believe that the statement just made can be taken in a literal sense. A picture as detailed as a definite axis localized in the particle is misleading. Nevertheless, neutrons and protons behave in many respects like rotating tops. The protons and neutrons carry an angular momentum which is half the unit of angular momentum in atomic physics. (The magnitude of unit angular momentum is 1.0546×10^{-27} erg-seconds and is usually called $\hbar$. This quantity is $\frac{1}{2\pi}$ times h, the quantum of action. *See* QUANTUM MECHANICS.) The angular momentum or spin of neutrons and protons behaves according to a certain set of rules. If the spinning motion around a given direction in space is investigated, it will always be found that the magnitude of the proton and neutron spin is one half of a spin unit, but that the sign of the spinning motion may have one of two opposite values. In other words the rotation may be clockwise or counterclockwise. The spin of nuclei may be considered as composed of the spins of the neutrons and protons in the nucleus. In the deuteron, which consists of a neutron and a proton, the spins of the neutron and proton seem simply to add, giving a total spin of one unit of angular momentum. The spin of the α-particle, which contains two protons and two neutrons, is equal to zero. In this case the spins of the constituent particles may be considered as partly clockwise and partly counterclockwise, so that the effects of the individual spins cancel. Indeed the spin was found equal to zero in all nuclei containing an even number of neutrons and an even number of protons.

To the angular momentum caused by the spins of neutrons and protons there must be added the effect of the motion of these particles along their orbits within the nucleus. Consider the nucleus of the lead isotope containing 208 particles. The spin of this lead isotope has been found equal to zero. Now if a proton, which carries one half unit of spin, is added to the nucleus, the result is a nucleus of bismuth (Bi^{209}) and it might be expected that this nucleus had a spin of one half (zero, caused by Pb^{208} plus one half, caused by the proton). Actually the nuclear spin of Bi^{209} is nine halves. Therefore an additional spin or angular momentum is present which is caused by the motion of the proton in its orbit.

Spin values of nuclei show a few simple regularities. If the system contains an even number of particles of spin one half, the total spin is zero or an integral multiple of the atomic unit of angular

momentum. If the system contains an odd number of particles of spin one half, then the system has a spin which is $n+\frac{1}{2}$ atomic units, where n is any positive integer or zero. This rule follows from the basic facts of atomic physics and from this rule was derived a strong argument against the presence of electrons in nuclei. According to earlier ideas the deuteron was considered as composed of two protons and an electron. Now the electron, like the proton, possesses a spin which is one half unit of angular momentum. This would give the deuteron an odd number of particles, each with one half unit of spin and according to the statement made above, the deuteron would be expected to have $n+\frac{1}{2}$ spin units. Actually it has a spin of one unit. If, on the other hand, the deuteron is assumed to consist of a proton and a neutron, the observed spin value agrees with the rule given above.

The spin of neutrons and protons suggests the idea of an internal rotation. Whenever a charged particle like the proton rotates, one expects to find that the particle behaves like a magnet. Furthermore, from the charge and the spin may be predicted the strength of the magnet associated with the proton. The proton, indeed, behaves like a magnet, but the strength of the magnet is 2.79 times the predicted value. This has been considered as an indication that the proton is not quite a simple particle but can undergo some internal change.

According to the simplest ideas the neutron, not carrying a charge, should have no magnetic effects. This again turns out to be incorrect. The neutron carries a magnetic moment whose strength is 1.935 times the predicted strength for the proton and whose sign is opposite to that of the proton. This means that the magnetic properties of the neutron are those of a rotating negative charge. The discrepancies just mentioned do not contradict any rigorous predictions of atomic theory but only those conclusions based on the idea that neutrons and protons are particles of a very simple kind.

The magnetic moment of the deuteron is almost but not quite the sum of the magnetic moments of the proton and neutron. The fact that there is a slight deviation does not constitute a real difficulty if one considers the effect of the orbits of these two particles within the deuteron. In general all nuclei which have a spin have a magnetic moment. Detailed predictions are not possible because knowledge of the internal structure of nuclei is meagre.

Neutrons and protons have a further peculiarity in that two particles of the same kind are never found to occupy the same state. This rule bears the name of the "Pauli exclusion principle." Within a nucleus orbits may be assigned to the nucleons (neutrons or protons). This assignment has to be made in such a manner that no more than two neutrons (or protons) shall be found in one orbit. Further, if there are two neutrons (or protons) in one orbit then these two particles must differ in spin; *i.e.,* one spin must be clockwise and one must be counterclockwise. It is possible for these two particles to be in the same orbit only because they differ in another one of their properties. The rule that two particles cannot be in the same state is thus satisfied. We see that the spin is significant for the details of nuclear structure. The possibility of two spin orientations allows the presence of two neutrons (or protons) in the same orbit of the nucleus.

The configuration of two neutrons or two protons in the same orbit seems to be stable so that, in general, a somewhat greater binding energy is found if the number of neutrons and the number of protons in the nucleus are both even; less if one or the other number is odd. The smallest binding energies are found for odd numbers of both neutrons and protons. In fact, only four stable isotopes are known with odd Z values and odd N values: H^2, Li^6, B^{10} and N^{14}. All others in this category are radioactive, indicating that the nucleus possesses sufficient energy to cause a transformation. Atomic species with even mass numbers are more abundant in the earth's crust and atmosphere than atomic species with odd mass numbers. The most abundant elements, Fe^{56}, Si^{28} and O^{16}, for instance, have even charges as well as even mass numbers. This is further evidence for the stability of the nuclei in question.

The simplest example of a very stable nucleus is helium, He^4. As many particles as possible are put into the lowest orbit which can hold two protons and two neutrons. As mentioned before, the packing fraction of helium is large. Any additional particles, either protons or neutrons, must go into new orbits in which the binding energy per particle is less.

Atomic nuclei behave differently according to whether A is even or odd. If the mass number is odd, then two identical nuclei cannot occupy the same state. If the mass number is even, two identical nuclei can be placed in the same state. In the former case we say that the nuclei obey Fermi-Dirac statistics; in the latter case we say that Einstein-Bose statistics apply. The two kinds of behaviour may be more exactly described by a statement concerning a function, the wave function (*see* QUANTUM MECHANICS), which describes the behaviour of particles, in particular the behaviour of pairs of identical particles. In the case of Einstein-Bose statistics this wave function remains unchanged if the positions of the identical particles are interchanged. In the case of Fermi-Dirac statistics a similar change leads to a change in sign of the function. Which of the two rules applies can be found experimentally by studying the rotation of a diatomic molecule containing the two identical nuclei. In this case the rotation actually brings about the interchange of the nuclei.

The application of these rules gives further proof that neutrons and protons, rather than protons and electrons, are the proper constituents of nuclei. For example, take a nucleus of nitrogen, ${}_7N^{14}$, which experimentally has been shown to obey Bose statistics. Assuming electrons and protons in the nucleus there would be present a total of 14 protons and 7 electrons. According to knowledge concerning protons and electrons, the interchange of two electrons or of two protons changes the sign of the function characteristic of the system. Thus the interchange of 14 protons and 7 electrons will invert the sign 21 times which amounts to a simple reversal of sign. This contradicts Einstein-Bose statistics which imply that interchange does not change the wave function. If on the other hand, ${}_7N^{14}$ is considered an assembly of 7 protons and 7 neutrons the interchange of the nuclei inverts the sign 14 times, which is equivalent to saying that the interchange leaves the sign unchanged.

It is seen, therefore, that a detailed consideration of finer nuclear properties like spins and wave functions gives the same final results as were obtained by more crude arguments: nuclei are built from neutrons and protons. To assume electrons in the interior of the nuclei would lead to a whole series of difficulties.

β-DECAY

A great number of nuclei are known to emit β-particles; *i.e.,* electrons or positrons. The emission of such a particle is accompanied by the transmutation of the nucleus. The resultant nucleus has the same mass number as the original one. If an electron has been emitted the nucleus in the final state will have one more positive charge than the original nucleus. If a positron is emitted the nuclear charge decreases by one unit. C^{11} is an example of a positron emitter, transforming into B^{11}, a boron isotope. C^{14}, another isotope of carbon, emits an electron and decays into nitrogen, N^{14}. An isotope of potassium, K^{40}, is capable of emitting either an electron or a positron and of transforming into calcium or argon, respectively.

The radioactive decay may be considered as a single act which takes an exceedingly short time, about 10^{-22} seconds. This is not, however, the time in which radioactive substances disappear. These elements have "lifetimes" which have been observed to vary from less than one-tenth of a second to more than 1,000,000,000 years. If there is an assembly of radioactive nuclei of a certain kind, then one half of these nuclei will have undergone radioactive decay in this "lifetime," which is more specifically called the half life.

Each radioactive nucleus has a probability of undergoing the radioactive process per unit time and this probability is independent of the previous history. In particular, this probability does not depend on the length of time the radioactive nucleus has existed. Thus is obtained the law for a radioactive population according to which the radioactive population is halved in each lifetime.

One may assume that each β-decay is caused by one of two basic processes. These are the transformation of a neutron into a proton accompanied by the emission of an electron and the transformation of a proton into a neutron with the simultaneous emission of a positron. These processes are intrinsically slow but the reasons causing the transition or determining its rate are not yet known.

The transition of a free proton into a neutron cannot be observed. This transformation could be written:

$$H^1 \rightarrow n + e^+$$

where n stands for a neutron and e^+ is the symbol of a positron. The neutron is known to be heavier than the proton by 0.00136 mass units and the total reaction products are heavier than the proton by 0.0019 mass units. The mass difference corresponds to an increase of energy during the reaction amounting to 1.77 Mev. If the neutron and positron gained kinetic energy during the reaction, the energy needed would be greater still. Thus at least 1.77 Mev must be supplied if the proton is to disintegrate into a neutron and a positron. Thus the reaction does not occur and the free proton is stable.

On the other hand a neutron can decay giving rise to a proton and an electron,

$$n \rightarrow H^1 + e^-.$$

The proton and electron together are 0.00081 mass units lighter than the neutron. According to the equivalence of mass change and energy change 0.754 Mev of energy are set free. The reaction described here is the simplest of all possible β-decays. It has been actually observed and its lifetime is approximately a quarter of an hour. Neutrons usually disappear much more quickly by reacting with other nuclei.

A β-decay process in a complex nucleus is described by one of the neutrons in the nucleus turning into a proton or one of the protons changing into a neutron, emitting an electron or positron, respectively. This picture correctly describes the fact that the mass number of the nucleus remains unchanged while the charge of the nucleus changes by plus or minus one in the two cases mentioned. In complex nuclei it often does pay to convert a proton into a neutron plus a positron. One may consider, for instance, the decay

$$C^{11} \rightarrow B^{11} + e^+.$$

While the sum of the masses of the neutron and positron is greater than the mass of the proton, the sum of the masses of B^{11} and e^+ is actually less than C^{11}. In the

$$C^{11} \rightarrow B^{11} + e^+$$

process a proton is turned into a neutron and a positron. The necessary energy is supplied by the greater binding energy of the resultant neutron. Thus the question whether or not a nucleus can emit an electron or a positron depends on whether or not the transformation of a proton into a neutron or the transformation of a neutron into a proton can lower the energy of the system. In the energy balance must be included: the mass difference between the neutron and proton, the binding energy of these particles in the nucleus and the mass of the positron or electron which is to be ejected.

It may occur that there is not enough energy available to transform a proton within a nucleus into a neutron and to eject a positron at the same time. A nuclear transformation may nevertheless proceed. Instead of the emission of a positron the nucleus may absorb one of the electrons which are always to be found in the vicinity of the nucleus. In this way instead of having to supply an energy equal to the mass of the positron, one gains the energy corresponding to the similar mass of the electron. For instance, the isotope of manganese containing 54 mass units in its nucleus decays by capturing an electron and one obtains an isotope of chromium.

Consider two nuclei: one shall contain N neutrons and Z protons, the other $N-1$ neutrons and $Z+1$ protons. Add to the latter an electron. Of the two systems now considered, one or the other will have a higher energy and whichever one this is will not be stable but will transform into the other system. Nuclei of the same mass number are called isobars. Two isobars, differing by one charge unit, are called neighbouring isobars. The argument shows that of neighbouring pairs of isobars, one must be unstable.

There are a few known cases of neighbouring isobars where both nuclei seem to be stable. The reason for this apparent stability is the small energy difference between the isobars. It will be seen later that β-transformations in which little energy is released may have long lifetimes. In these cases β-processes may be so rare as to escape observation.

Now consider two isobars which differ by two charge units. There are many examples of such isobars. If all other isobars have higher energies than these two, then both of these isobars may be stable. In fact, a single transition will lead to a system of higher energy. A lowering of the energy could occur only if two β-transitions, *i.e.*, the ejection of two electrons or two positrons, occurred simultaneously. It has been mentioned above that the lifetime of radioactive nuclei is very long compared with the time an electron needs to cross the nucleus. This fact can be expressed by saying that the β-process is an improbable one. A process in which two electrons or two positrons undergo this improbable transition simultaneously is so unlikely that one should never expect to observe it.

In the previous section it was stated that nuclei containing an even number of neutrons or an even number of protons have lower energies and are more stable than nuclei containing an odd number of neutrons or an odd number of protons. If a nucleus contains an odd number of neutrons and an odd number of protons then one may suspect that it can assume a more stable configuration in two ways: by emitting an electron and transforming a neutron into a proton or else by emitting a positron and transforming a proton into a neutron. In either case an even number of protons and neutrons will be obtained. It is frequently observed that a nucleus of even mass number and odd Z value emits both electrons and positrons. One example is K^{40} mentioned above.

In a stable nucleus a certain balance exists between the number of neutrons and the number of protons. For a given number of protons the neutron number may vary between narrow limits. If an excess of neutrons is present an electron will be emitted and one of the neutrons turns into a proton. The product will be a stable nucleus or at least one which has a smaller neutron excess. In a like manner, if the nucleus has a proton excess, the nucleus will emit a positron, transforming a proton into a neutron.

These facts can best be summarized in two curves, as shown in figs. 1 and 2. For isobaric nuclei with odd mass number it does not make much difference whether Z is even or odd. In the first case we have an even number of protons but an odd number of neutrons. In the latter case the number of neutrons is even, that of the protons is odd. The result is a smooth dependence of the energy on Z as shown in fig. 1. The arrows indicate possible transitions. For isobaric nuclei with even mass number nuclei with even Z values have a lower energy than nuclei with odd Z values. The former contain an even number of protons and an even number of neutrons, the latter an odd number of protons and an odd number of neutrons. The resulting energies are shown by the curves in fig. 2. The transitions are again indicated by arrows. The figures illustrate that for even mass number one may expect more than one stable isobar, while for odd mass number only one isobar is likely to be stable.

FIG. 1.—SCHEMATIC REPRESENTATION OF THE ENERGY OF ISOBARS AS A FUNCTION OF ATOMIC NUMBER: ODD MASS NUMBER

It would be expected that when a β-ray is emitted from a nucleus it should carry away with itself in the form of kinetic energy the difference in energy between the original and the resulting nuclei. This is not so. The β-particles emitted from one definite nuclear species have various energies: some carry very little energy, most of them about one-half or one-third of the ex-

pected energy and a few nearly all of that energy. None are found to carry an energy in excess of the expected amount. In fig. 3 it is shown how in two definite examples the frequency of occurrence of β-rays depends on the energy of the β-rays. The frequency of occurrence for β-rays carrying various amounts of energy is plotted on the abscissa. The maximum energy indicated (in the figure the energy corresponding to six electron masses or 6 mc^2 is used; this corresponds to about 3 Mev) is the expected amount. It is seen that the frequency of occurrence goes to zero as the maximum energy is approached. The curves might be expected to go to zero for zero energy also. The coulomb force of the charged nucleus, however, influences the distribution curves for the low-energy electrons and positrons. The nucleus attracts electrons, decreasing their energy and increasing the occurrence of zero-energy electrons. Conversely, the repulsion of the positrons by the nucleus increases their energy. None is emitted with zero energy and few with very low energies.

FIG. 2.—SCHEMATIC REPRESENTATION OF THE ENERGY OF ISOBARS AS A FUNCTION OF ATOMIC NUMBER: EVEN MASS NUMBER

The fact that β-rays of a definite decay process have varying energies is surprising. It has not been possible to explain the varying energies of β-rays by the assumption that β-rays come from nuclei differing to a certain extent in their properties. Neither did it prove possible to assume that β-rays of varying energy leave the nucleus with correspondingly varying residual energy. On the other hand, the law of conservation of energy requires that the energy difference between the expected and the actual amount should appear in some other form.

The simplest explanation of the facts described above is the following: in the decay process not one but two particles are emitted from the nucleus. One of them, the β-ray, is an electron carrying a positive or negative charge. The other one is called the neutrino. It carries no charge and has no intrinsic mass, but it carries away the missing amount of energy from the nucleus in the form of kinetic energy.

The assumption that a neutrino is emitted together with the β-ray has helped to explain a number of peculiarities of the β-process. First, the neutrino hypothesis does not merely explain that β-rays from the same decay process have various energies, but it is also capable of accounting for the frequencies with which various β-energies occur. Fig. 3 gives the energy distribution for the simplest kind. This type of distribution has been predicted by theory and has been verified experimentally in a few cases. Other types of frequency distributions have been observed.

On the basis of the neutrino theory it was also possible to predict that the probability of β-decay increases with the fifth power of the energy released in the decay. In other words, the lifetime of the radioactive nucleus is inversely proportional to the fifth power of the maximum energy of the β-particle. This law is an approximate one and holds only for the simplest type of β-decay, for sufficiently high energies and for similar nuclei. The more complex β-disintegrations seem to have a decay probability which differs from the probability predicted by the simple theory. These anomalous β-decay processes have smaller decay probabilities and considerably longer half lives than the normal processes.

FIG. 3.—THEORETICAL β-RAY SPECTRUM FOR Z=82. UPPER CURVE IS FOR ELECTRON EMISSION; LOWER CURVE, FOR POSITRON EMISSION

There is a further group of phenomena which can be explained with the help of the neutrino hypothesis. These are the changes of nuclear spin and nuclear statistics during a β-decay. It has been stated previously that a nucleus or, more generally, an association of particles will have a spin which is an even or odd multiple of one-half the elementary unit of spin according to whether the system contains an even or odd number of particles, each carrying one-half unit of spin. Now a β-ray carries one-half of a spin unit and so do the neutrons and protons of which the nucleus is built. If it is assumed that in a β-process the β-ray is emitted by itself, then the number of particles carrying one-half unit of spin would have increased by one during the process. It would be necessary to assume that the total spin of the system changes. It is, however, a very general rule that the spin of a system left to itself, like a nucleus undergoing a β-decay, must not change. The rule of conservation of spin is indeed almost as strongly supported by experience as the rule of conservation of energy. The emission of a single electron would violate spin conservation as well as energy conservation. If it is assumed that together with the electron a second particle, the neutrino, is emitted and, if it is also assumed that the neutrino carries a half unit of spin, the difficulty disappears.

An analogous argument can be put forward for nuclear statistics. It has been mentioned that a nucleus or system of particles has Einstein-Bose statistics or Fermi-Dirac statistics, respectively, if it contains an even or odd number of particles which themselves obey Fermi-Dirac statistics. Protons, neutrons and electrons do behave according to Fermi-Dirac statistics. If the β-process consisted of the emission of an electron only, the total number of particles would change by one and during the process the system would change from Einstein-Bose statistics to Fermi-Dirac statistics or vice versa.

Such a change in statistics is completely alien to our notions about the composition of matter. For instance, two systems obeying Fermi-Dirac statistics cannot be in the same state, but two systems obeying Einstein-Bose statistics prefer to be in the same state. The transformation of a system from one statistics to another would imply a changed behaviour of similar systems. This change would be so peculiar that we find ourselves unable to incorporate it in the mathematical laws which describe physics in the atom. If it is assumed, however, that together with an electron a neutrino is emitted and that the neutrino obeys Fermi-Dirac statistics, the difficulty is resolved. Two particles obeying Fermi-Dirac statistics are emitted in the process and therefore a change in statistics is not expected.

In addition to carrying energy a neutrino also carries away a momentum which can be calculated from the energy which it possesses. If a nucleus which was originally at rest suffers a β-decay, the momenta carried by the decay products must add up to zero. Since the neutrino is invisible, the momenta of the observable particles do not cancel. By measuring these momenta, one can obtain the momentum which the neutrino must have carried. This difficult experiment has been performed and indicates that the neutrino carries the expected momentum.

Finally, since neutrinos are emitted in β-decays, one can show that they in turn stimulate β-disintegration when they impinge on otherwise stable nuclei. Since the β-disintegration is an exceedingly improbable process, this stimulating effect of the neutrinos is very weak. By using the large neutrino fluxes which are emitted by big nuclear reactors, it has been possible to obtain some indication of this stimulating influence of the neutrino. The evidence for the existence of neutrinos is thus partly indirect and partly based on extraordinarily difficult experiments. Nevertheless, the existence of neutrinos can hardly be questioned.

α-DECAY AND SPONTANEOUS FISSION

In the β-decay a nucleus emits particles which, according to our model, the nucleus does not actually contain. The electron and neutrino emitted in the process may be considered as born at the moment of emission. In other radioactive processes, which are discussed now, particles are ejected from the nucleus which were present in a different configuration before the decay took place.

In another respect all radioactivities are similar: the half life of a radioactive nucleus is always exceedingly long as compared with times in which nuclear rearrangements could be expected to take place. The ratio of these times is in most cases larger than 10^{20} and sometimes even much greater than that. The reason for such long lifetimes is unknown in the case of β-processes. The reason must, it is thought, lie in the nature of the birth process of electron-neutrino pairs. In the case of other radioactive processes, such as α-decays and spontaneous fission, G. Gamow, E. U. Condon and R. Gurney have satisfactorily explained the long lifetimes.

In an α-disintegration a nucleus emits an α-particle, which is itself a very stable nucleus containing two neutrons and two protons. α-active nuclei are encountered among the nuclei which carry the highest charges. In these nuclei the repulsion between the α-particle and the rest of the nucleus results in an energy release which is not only sufficient to overcome the short-range attraction between the α-particle and the rest of the nucleus, but also gives the α-particle a kinetic energy of a few million electron volts.

The spontaneous fission process is also observed in the most heavily charged nuclei. In this process a nucleus divides into two approximately equal fragments which under their mutual coulomb repulsion, fly apart with a kinetic energy close to 200 Mev.

Both in the α-decay process and in the spontaneous fission process there is an important obstacle to the disintegration. The initial part of the disintegration, instead of releasing energy, actually would require some added energy which is not available in the cases considered. Thus an α-particle at a large distance from the nucleus has a lower potential energy than when it is inside the nucleus. However, an α-particle outside the nucleus but close to it, *i.e.*, when it is in an intermediate state of the disintegration process, has a higher potential energy than when either in the initial state inside the nucleus or in the final state when it is far away. This is, indeed, not surprising. In order to bring the α-particle from the initial state to the intermediate state it is necessary to do work against the short-range forces holding the α-particle in the nucleus. Again, if it is desired to bring the nucleus from the final state into the intermediate state it is necessary to do work against the coulomb repulsion. It is seen that the α-particle has to overcome a potential barrier in order to get from the initial state to the final state. Since there is not enough energy available to do this the process should be impossible from the point of view of classical mechanics. In the mechanics which is valid for particles of atomic and subatomic size it is not possible to localize sharply any particle without giving it a high amount of energy at the same time. Applying this kind of mechanics to the motion of the α-particle it is found that the α-particle, instead of staying in the nucleus, will leak through the potential barrier. While this statement is in conflict with our intuition concerning the behaviour of particles, it must be accepted on the basis of extensive experience of atomic and subatomic physics. The penetration of the potential barrier by these particles is closely related to the fact that these small particles, as long as they have a well-defined energy, cannot be sharply located on one side of the barrier.

The necessity of penetrating a potential barrier in the process of disintegration explains the long life and small disintegration probability of the α-active substances. This surprising penetration of a potential barrier becomes extremely improbable as the height or the breadth of the barrier or else the mass of the particle in question becomes bigger. The result is that an α-particle may approach the surface of the nucleus 10^{20} times or more often before it actually succeeds in leaving the nucleus. A further consequence is that relatively small differences between α-active substances cause great changes in the decay probability. The most important factor influencing the decay probability is the energy released in the α-process. If the decay energy is high, that energy will approach more closely the top of the barrier. The result is a greatly increased penetration probability and a greatly increased rate of decay. In fig. 4 the half lives of the α-active nuclei are plotted against the energy released in the α-decay. While the range of energies for which observations exist extends only from 3.5 to 9 Mev, the corresponding lifetimes are of quite different orders of magnitude. They range from 10^{-7} seconds to 10^{10} years, a time longer than the age of the earth. In order to plot all of these different times in a single graph a logarithmic scale is used. This means that each unit on the vertical scale stands for a factor ten in the lifetime. Next to the ordinate the half-life values are entered in units of seconds and also in units of years. The dots in the figure represent observations for various α-active nuclei. The curve was obtained by applying the theory of barrier penetration to the α-decay process. While this theory disregards all finer details of nuclear structure it is still in excellent agreement with the general trend of the observed points.

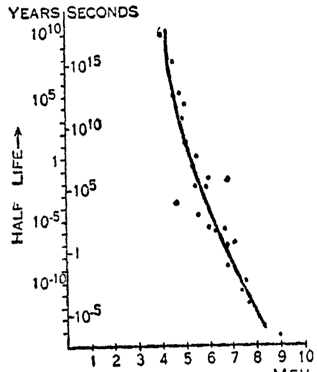

FIG. 4.—HALF LIFE FOR α-DECAY AS A FUNCTION OF α-RAY ENERGY. (SOLID CURVE IS THEORETICAL)

An entirely similar situation is encountered in the theory of spontaneous fission. Here the nuclear division must be considered as the end result of a process in which an originally spherical nucleus first takes on the form of an ellipsoid, then that of a dumbbell, then that of two smaller and nearly spherical pieces close to each other which finally fly apart to form the fission fragments. The initial distortion in this process requires an energy which, as in the case of α-decay, is actually not available. A potential barrier must be overcome if the fission is to proceed. This potential barrier is probably less high than the one encountered in α-decay. The particles to be moved through this barrier, however, are the fission fragments, containing about 100 neutrons and protons instead of the 4 nuclear units contained in an α-particle. The fact that a much bigger mass must be moved through a potential barrier decreases the disintegration probability. The uranium isotope U^{238} is among the α-active nuclei of longest life with a half life of 4.5×10^9 years. Yet this nucleus will have more than 1,000,000 times greater probability to decay by an α-process than to undergo spontaneous fission.

METASTABLE NUCLEI

If a nucleus is not in its lowest state of energy, it is said to be in an excited state. Lifetimes of such excited states, as a rule, are short and the nucleus falls into the lowest energy state, emitting the excess energy as radiation. The time required for this process in many cases is of the order of 10^{-14} seconds. The energy emitted leaves the nucleus in the form of γ-radiation.

If the excitation energy is relatively small, *i.e.*, of the order of 100,000 v., the lifetime of the excited state is relatively longer, in some cases exceptionally long. These transitions are similar to the anomalous β-decay processes which, as has been pointed out, have longer half lives than the normal β-decay processes. The exceptional nuclei are called metastable. Their lifetimes are often of the order of a few seconds, some much longer. An isotope of krypton, Kr^{83}, for instance, has a lifetime of 113 minutes. Two γ-ray energies have been observed: 0.029 Mev and 0.046 Mev. A long lifetime, 13.8 hours, is also shown for Zn^{69}. The γ-ray energy for this metastable state is 0.45 Mev.

Often such nuclei apparently emit electrons rather than γ-rays. The reason for this behaviour is that the electromagnetic radiation transmits its energy to an electron before the radiation leaves the immediate vicinity of the nucleus. While this electron originally has been a part of the same atom to which the nucleus belongs, it should be emphasized that the electron never was a part of the nucleus. That is, the electron is not actually emitted by the nucleus.

The electromagnetic energy has been converted to kinetic energy of an electron which was formerly bound to the atom. These electrons are called conversion electrons. These conversion electrons

can easily be distinguished from β-rays because their energy is well defined, while the electrons emitted from nuclei always have a continuous range of energies. Conversion electrons very frequently accompany γ-rays, but they are found with particularly high probability in the γ-processes of long lifetime which were described above.

NUCLEAR REACTIONS

Up to now, this discussion has considered in some detail processes in which a nucleus undergoes a spontaneous transition. There exists a much more varied class of nuclear transformations, namely the transformations which occur when a nucleus collides with another nucleus or some other particle. Every nucleus is, of course, in practically continuous contact with the electrons which together with the nucleus make up an atom. Stable nuclei are not capable of reacting with these electrons. β-active nuclei may absorb an external electron, as described above. This process is closely related to ordinary β-activity and it has been treated under the heading *β-Decay*. This section will consider the collisions of a nucleus with a fast electron, with a γ-ray, with another nuclear particle, such as a neutron, proton, deuteron, a heavier nucleus or with one of the unstable particles called mesons, which themselves are generated in nuclear collisions.

Bombardment of nuclei by fast electrons throws the nuclei into excited states whose characteristic γ-radiations have been studied. The collision of a nucleus with a γ-ray may also result in the excitation of that nucleus. If the energy of the γ-ray is sufficiently high, absorption of the γ-ray will be followed by a nuclear disintegration, most frequently the emission of one or more neutrons. It has been observed that γ-rays of a characteristic resonance energy are particularly readily absorbed by nuclei. This resonance energy is in the neighbourhood of 20 Mev. It is somewhat higher for light nuclei and somewhat lower for heavy nuclei.

If a reaction between two charged nuclei is to be studied at least one of these particles must have considerable kinetic energy. Otherwise the electric repulsion prevents the nuclei from approaching to a sufficient extent. According to classical mechanics one would expect that the approaching particles must possess a minimum kinetic energy if they are to get in contact with each other and if they are to react. Actually this simple argument is incorrect. The approach of two charged particles is more involved and is similar to the process of α-decay in which two charged particles are moving apart. Even if sufficient energy is not available for the two particles to come into contact according to the classical picture there remains a small probability for the collision partners to penetrate through the barrier separating them. This probability rapidly becomes smaller as the energy of approaching particles decreases. At small energies the resulting nuclear reactions occur so rarely that they become practically unobservable.

It follows that reactions between nuclei are more easily observed when the nuclei contain relatively low charge. The reactions which can be studied at lowest energies are those between two singly charged deuterium nuclei: $H^2+H^2\rightarrow H^1+H^3$ and $H^2+H^2\rightarrow He^3+n$. These reactions have actually been followed down to 10,000 ev bombarding energy; *i.e.,* to the energy of a "soft" X-ray tube.

Reactions between light nuclei and protons are of particular interest because according to present ideas such reactions are responsible for energy production in the sun. In some of these reactions the proton attaches itself to a nucleus and an α-particle is emitted. An example of such a reaction is $Li^7+H^1\rightarrow He^4+He^4$. A second example is $N^{15}+H^1\rightarrow C^{12}+He^4$. When more heavily charged nuclei are bombarded by protons, the emission of α-particles becomes less likely. The reason for this is similar to the reason for the long life of α-emitters. The α-particle to be emitted must surmount a high barrier. This process, therefore, becomes improbable and the nuclear reaction is likely to take another course.

One of these other possibilities is that the proton attaches itself to the nucleus and a neutron is emitted instead. This has been observed in collisions between lithium and protons. The reaction proceeds according to the relation: $Li^7+H^1\rightarrow Be^7+n$. One notices that the colliding partners are the same as those which lead to two α-particles according to: $Li^7+H^1\rightarrow He^4+He^4$. It actually is frequently true that a collision between two nuclei gives rise to several competing processes. Depending on the energy of the colliding particles one or the other of these reactions will occur either preferentially or exclusively. For instance, if the energy of the bombarding proton is less than 1.6 Mev, neutron emission does not occur because the sum of energies of Be^7 and a neutron is higher than the energy of the Li^7 and H^1 by just 1.6 Mev. On the other hand, the formation of two α-particles releases energy and can, therefore, proceed at any energy of the bombarding protons providing the proton gets close enough to the lithium to react with it. Since the neutrons are unaffected by electrostatic repulsion the ejection of a neutron by a proton may proceed without difficulty in more heavily charged nuclei. An example is:

$$Sb^{121}+H^1\rightarrow Te^{121}+n.$$

A proton may also simply attach itself to the nucleus with which it collides. This happens in the reaction

$$C^{12}+H^1\rightarrow N^{13}+\gamma.$$

In reactions of this type the binding energy of the proton in the nucleus is released in the form of γ-rays. This energy release is a relatively slow process. It takes, as a rule, only 10^{-14} seconds, but the time in which a neutron or an α-particle could be released by the reacting partners is very much shorter still, namely 10^{-20} seconds or less. Thus, the reaction between N^{15} and protons could, in principle, lead to the formation of O^{16} according to the scheme $N^{15}+H^1\rightarrow O^{16}+\gamma$. The reaction mentioned above $N^{15}+H^1\rightarrow C^{12}+He^4$ seems, however, to occur almost exclusively because this type of rearrangement between the reaction partners happens to take a much shorter time. On the other hand, $C^{12}+H^1\rightarrow N^{13}+\gamma$ can occur more readily because in this case no competing process exists as long as the proton does not have too high an energy. Actually both the ejection of an α-particle or a neutron from the carbon nucleus would require a very high proton energy.

When a nucleus is bombarded by a deuteron, reactions similar to those discussed above occur. In particular, neutrons and α-particles are found among the reaction products. The reaction to which deuteron bombardment most often leads is the ejection of a proton. This reaction occurs with relative ease even if the bombarded nucleus has a high charge. The deuteron does not need actually to penetrate to the surface of its target. When the coulomb repulsion becomes too strong the deuteron decomposes into a neutron and a proton. The neutron suffers no repulsion and reaches the surface of the nucleus while the energy of the reaction is carried away by the proton.

Among reactions with heavier nuclei mention shall be made only of the reactions with α-particles. Because of the availability of natural α-rays these were the first to be observed; they were of further historical importance in that they led to the discovery of the neutron. One of the easiest and earliest methods of producing neutrons is by the reaction $Be^9+\alpha\rightarrow C^{12}+n$. In reactions with more heavily charged nuclei α-particles can participate only if they carry a rather high kinetic energy. Even more kinetic energy would be required if the bombarding nucleus had more than two charge units.

When a nucleus is bombarded with neutrons whose energy is in excess of 1 Mev, the result is not very different from the reactions that occur when fast deuterons or protons are the bombarding particles. Of course the neutrons, not being repelled by the nuclear charge, can penetrate into heavy and light nuclei with equal ease. The result again may be the attachment of a neutron to the nucleus accompanied by the emission of a γ-ray. An example is $Au^{197}+n\rightarrow Au^{198}$. The resulting isotope of gold is unstable and decays to mercury. The fact that the resulting gold isotope is radioactive makes it easy to establish that the reaction has actually occurred in a bombarded gold sample.

A second type of reaction with neutrons is the re-emission of the original neutron plus the emission of another neutron. The first neutron serves to knock the second neutron out of the bombarded nucleus. Since the second neutron is strongly bound only bombarding neutrons carrying high energy produce this reaction.

The result of this reaction is an isotope of the original bombarded nucleus having a mass number diminished by one. The reaction

$$O^{16}+n \rightarrow O^{15}+n+n$$

may serve as an example.

In another type of reaction the neutron attaches itself to the nucleus and a proton is emitted instead. This is illustrated in the reaction

$$Zn^{66}+n \rightarrow Cu^{66}+p.$$

While in this reaction the neutron is free to penetrate into the nucleus, the proton encounters a potential barrier on its way out. This barrier again results from coulomb repulsion and is higher for more heavily charged nuclei. Thus this reaction will occur with considerable probability only in light nuclei or else in those cases where the outgoing proton receives a rather high energy, sufficient to overcome the potential barrier just mentioned.

The same situation is encountered if an α-particle is emitted after the neutron has attached itself to the bombarded nucleus. As an example we may mention the reaction:

$$N^{14}+n \rightarrow C^{11}+\alpha.$$

The reaction products have, in this case, a greater total mass than the original neutron and nitrogen. The mass difference corresponds to 2.25 Mev and therefore only neutrons having an energy greater than 2.25 Mev will be able to produce this reaction. It might be noted that in this case neutron bombardment also gives rise to the reaction:

$$N^{14}+n \rightarrow C^{14}+p.$$

This reaction releases energy, and therefore proceeds at low as well as high neutron energies. The two reactions just discussed are competing processes. This situation is quite typical. If the bombarding particle does not have much energy few types of reactions can take place. At higher bombarding energies more reactions become possible.

Among the nuclear reactions induced by neutron bombardment the fission of uranium and thorium are of greatest practical importance. As stated above, uranium may disintegrate into two roughly equal fragments even of its own accord. The rearrangement of nuclear matter, however, which leads to this fission process requires an initial investment of energy. Thus the spontaneous fission can take place only if the resultant particles penetrate a potential barrier, which is an exceedingly improbable process. If a uranium or thorium nucleus is hit by a neutron, the neutron attaches itself to the nucleus and delivers to the nucleus the binding energy of the neutron, amounting to several Mev. This energy sets the particles of which the nucleus is composed into motion. This motion may lead to the rearrangement necessary to initiate the fission process. It is interesting to note that the common isotopes of thorium and uranium, Th^{232} and U^{238}, require neutrons of relatively high initial energy if fission is to be produced. The reason is that fission is a quite improbable process unless the neutron furnishes enough energy to deform the nuclear matter to a point from where the further process is a "downhill" motion; *i.e.,* a motion which is connected with a diminution of potential energy. If a neutron fails to deliver sufficient energy to lift the nucleus to the top of the potential barrier, the fission process becomes quite improbable. In this case it is more likely that the excited nucleus will get rid of its energy either by reemission of the original neutron or by the emission of a γ-ray. In the former case the neutron returns to the original bombarded nucleus; in the second case, the reaction product is an isotope of the bombarded nucleus which contains an additional neutron. There is no reason why nuclear fission could not be produced by proton and deuteron bombardment as well as neutron bombardment. The protons and deuterons are, however, strongly repelled by the electrostatic field of the heavily charged uranium nucleus. Thus only highly energetic protons and deuterons are capable of producing fission.

Neutrons with an energy of 20 Mev or more are capable of producing fission in bismuth, lead and even lighter nuclei. In these cases fission probably results after a few preliminary processes have occurred. First the neutron communicates to the nucleus a high excitation energy. Thereafter the nucleus emits several particles, mostly neutrons. This process is called spallation. Neutrons escape preferentially because they need not overcome any potential barrier. Thus the nucleus is left with an unusually great excess of protons. The charge of these protons facilitates fission and a certain fraction of the bombarded nuclei actually divide into two similar particles.

The neutron reactions discussed thus far are usually referred to as "fast" neutron reactions. In contrast to these, "slow" neutron reactions signify events in which nuclei are hit by neutrons carrying a fraction of an electron volt. The neutrons in a typical slow neutron reaction possess about 100,000,000 times less energy than the neutrons in a fast neutron reaction. These slow neutron reactions are in many respects quite different from reactions in which only fast particles participate. These will be discussed in some detail since they play an important part in the release of atomic energy for useful purposes.

All the neutrons observed are products of nuclear reactions. Originally these neutrons are fast. Slow neutrons are obtained by allowing the fast ones to make a considerable number of collisions with other nuclei. There are many nuclei with which neutrons can collide repeatedly without causing nuclear reactions and without being captured by these nuclei. Frequently the only possible process is an elastic collision in which the neutron gives some of its energy to the collision partner. If, for instance, a neutron collides with a proton it loses roughly one-half of its energy in each collision. In collisions with carbon nuclei the neutron is apt to lose one-sixth of its energy. As a result 20 collisions with protons will suffice to deprive a neutron of all but one-millionth of its original energy and roughly 100 collisions with carbon nuclei produce the same result.

The energy loss, however, will not proceed indefinitely. All nuclei of the atoms in and around us participate in a disorderly motion which is caused by the heat energy shared by all bodies. The average energy of the particles at room temperature is about $\frac{1}{40}$ ev. When the neutrons are slowed down to this energy they will cease, on the average, to lose energy in collisions. They will rather participate from then on in the general thermal agitation of all particles. Neutrons of about $\frac{1}{40}$-ev energy are therefore often called thermal neutrons. The term "slow" neutrons is not restricted to the thermal neutrons but includes those of somewhat higher and lower energies. Thermal neutrons, however, are typical representatives of the class of slow neutrons. It is of interest to note that thermal neutrons move with an average velocity of 1.3 mi. per second. It seems peculiar to call such neutrons slow but they are slow compared with neutrons of 1 Mev energy whose velocity is little less than 10,000 mi. per second.

Reactions of slow neutrons differ from other nuclear reactions in several important respects. Slow neutrons may be absorbed very effectively by certain appropriate materials. Thus $\frac{1}{100}$ in. of cadmium is sufficient to absorb most of a beam of slow neutrons. A beam of fast neutrons, on the other hand, penetrates approximately two inches of any condensed material before the beam is strongly absorbed or otherwise altered in its properties. Slow neutrons are not absorbed so strongly by all kinds of nuclei. In collisions with nuclei such as carbon or lead, for instance, slow neutrons are hardly ever absorbed. Furthermore a reaction between a slow neutron and a nucleus depends on the energy of the neutron in a very sensitive manner. The reaction of neutrons with indium nuclei are very characteristic in this respect. A thermal neutron beam is effectively absorbed by an indium foil, while neutrons of one volt energy are considerably less affected. Neutrons of a sharply defined energy of 1.44 ev are more strongly absorbed in indium foils than neutrons of any other energy.

The peculiar behaviour of neutrons described above is the result of two facts. One is that slow neutrons spend a longer time in the neighbourhood of each nucleus and are more likely to be captured in a single collision. The second fact is the existence of compound nuclei which are formed by the initial fusion of the reaction partners and which possess well-defined energy levels. As an example let us continue to consider the reaction of indium with slow neutrons. If a neutron is bound to an indium nucleus an energy of approximately 8 Mev is released. At the time that

a slow neutron enters the binding energy appears as agitation of the compound nucleus. The designation of compound nucleus refers to this original agitated nucleus which is formed as a first step in the nuclear reaction.

The energy of agitation is not arbitrary but can be one of a certain number of rather sharply defined values. If the small kinetic energy of the incident neutron added to its big binding energy is just sufficient to form a compound nucleus in one of these sharply defined energy states then the neutron will enter the nucleus with a high probability. The energy at which the neutron enters with the greatest probability is called the resonance energy. The more the energy of the neutron differs from this resonance energy, the smaller will be its chance to enter the nucleus. A change in neutron energy of only one-tenth of an electron volt is sufficient to alter considerably the chance of the neutron to participate in the reaction.

These sharply defined levels of compound nuclei do not occur in the case of light atomic nuclei. This fact has been explained by a typical law of atomic physics according to which sharply defined energy levels occur only if these energy states have comparatively long lifetimes. If a state has a lifetime of 10^{-21} seconds (which is a typical period for nuclear rearrangements) then the energy levels cannot be defined better than to 1,000,000 v. The sharply defined energy of the compound nuclei indicates a lifetime more than 1,000,000 times longer than the time for a simple rearrangement. Why such long lives should occur when a slow neutron enters a nucleus of high weight, such as indium, may be understood in the following manner. When a neutron of small energy enters a nucleus its considerable binding energy is promptly shared as energy of agitation by the many particles of the nucleus. If the original neutron is to leave the nucleus again all of this energy must once more be concentrated on a single neutron. This process is unlikely and, on the average, takes a long time. If the nucleus consists of few particles then it will be more easily possible to concentrate the energy on a single one of these particles. On the other hand, if we have started with a fast neutron, then it will not be necessary to return to this neutron all of its energy to enable the original neutron to escape again.

Once a slow neutron has entered a nucleus and has found a compound state several reactions are still possible. The most probable of these is the emission of the binding energy of the added neutron in the form of γ-radiation. In this way an isotope of the original bombarded nucleus is formed. Thus we have the reactions:

$$H^1+n\rightarrow H^2+\gamma.$$
$$O^{16}+n\rightarrow O^{17}+\gamma$$
$$U^{238}+n\rightarrow U^{239}+\gamma.$$

The last reaction will be referred to again in the utilization of nuclear energy.

Among the lightest and the heaviest nuclei there are a few more important reactions following neutron capture.

Protons are emitted in the reaction of slow neutrons and nitrogen:

$$N^{14}+n\rightarrow C^{14}+p.$$

The resulting β-active isotope of carbon is most useful in the study of reactions in organic chemistry and biochemistry. This isotope of carbon is formed in small amounts by cosmic rays and occurs, therefore, as a "natural" activity. Its half life is 5,568 years. By measuring the carbon activity in an archaeological sample one may determine the age of that sample.

In reactions with Li^6 and B^{10} the absorption of a slow neutron results in the emission of an α-particle, according to

$$Li^6+n\rightarrow H^3+He^4$$

and

$$B^{10}+n\rightarrow Li^7+He^4.$$

These reactions are important because these nuclei, especially B^{10}, are very strong neutron absorbers. In contrast to indium, which preferentially absorbs neutrons of 1.44 ev energy, all neutrons are absorbed by Li^6 and B^{10}, but slow neutrons, which spend more time in the neighbourhood, are absorbed with greater probability.

The fact that slow neutrons are strongly absorbed by particular materials permits the regulation of the number of slow neutrons and allows or denies them access to certain parts of materials. The control of the energy release in chain reacting materials is based on this property of slow neutrons.

The energy released by slow neutron capture is insufficient to cause fission in any isotope which occurs with great abundance in a natural substance. In some materials, particularly in U^{235} and Pu^{239}, slow neutrons do give rise to fission. The consequence of this fact will be discussed later.

New high-energy accelerators have produced protons carrying several hundred Mev. Bombardment of nuclei by such protons often gives rise to disintegration into several fragments. It is remarkable, however, that more gentle interactions are not unusual. Thus a proton may collide with a nucleus without changing its energy or momentum to a great extent. In the collision, however, the proton turns into a neutron, leaving its charge behind in the nucleus with which it collided. It also happens quite often that the impinging proton picks up a neutron during its contact with a nucleus. The bombarding particle changes, therefore, into a deuteron but continues on its path without any great deflection or loss of energy.

The most important result of experiments in the several-hundred-Mev range has been the production of mesons. These are unstable particles, some of which are neutral while some carry a unit of positive or negative charge. A considerable variety of these particles has been discovered. They differ not only in their charge but also in their masses, spins, lifetimes and modes of decay. At least one class of these mesons, the π-mesons (pi mesons) is closely connected with the forces that bind the nucleons into stable nuclei. This connection will be discussed below.

It has become customary to designate mesons as well as nucleons, electrons and neutrinos as "elementary particles." With the increase in the number of these particles it becomes likely that at least some of them are no more elementary than atoms are indivisible. It is expected that some simple and general laws of physics will eventually explain the properties of all these particles.

SUMMARY OF NUCLEAR PROPERTIES

The nuclear reactions described in the last section led to the discovery of a very great number of previously unknown radioactive nuclei. These, together with the nuclei which occur in nature, are collected in the accompanying chart. In this chart each nucleus is represented by a square. For instance, in the second column from the left the isotopes of hydrogen appear. The charge number, one, and the atomic symbol, H (for hydrogen) appear at the foot of the column. The lowest square corresponds to a proton. In the square is found the mass number for the proton, which is one, and below it the abundance of protons in ordinary hydrogen is indicated. The figure 99.985 means 99.985% of ordinary hydrogen consists of light hydrogen or protons. The square above the proton corresponds to heavy hydrogen or deuterium with a mass number two. Its abundance in ordinary hydrogen is 0.015%, which is also entered. The third square in the column corresponds to tritium, the radioactive isotope of hydrogen. This isotope does not occur in nature and so the second line in the square contains a zero. Instead the half life, 12.4 years, has been entered in the third line. The arrow attached to this isotope shows that the nucleus decays to He^3, the light isotope of helium, occurring in the next column. On the left-hand side is the number of neutrons in the nuclei. Therefore, next to the proton is found zero, indicating that this lightest isotope contains no neutrons. Next to deuterium and tritium, the figures 1 and 2 indicate that these isotopes contain one and two neutrons, respectively. The next column represents the helium nuclei, of which again two stable and one radioactive nuclei are known. It is significant that the square corresponding to He^5 is empty. The reason for this will be discussed in the next section. The following columns correspond to lithium, beryllium, boron and heavier nuclei. The table is presented in six sections. Throughout the table the three numbers occurring in the squares correspond to the atomic number, the abundance and the lifetime. In the second line zero appears for all nuclei which are not found in the elements as they

occur in nature. In all but a few of the heaviest elements natural terrestrial sources always have the same isotopic abundances. This abundance is indicated by the figure in the second line. It should not be taken for granted that the isotopic abundance outside the earth is the same as on the earth. This, however, seems to be the general rule. The figures on abundance are omitted in some of the heavy nuclei in which all isotopes are radioactive and in which the isotopic abundances are dependent upon the method by which the element is obtained.

The radioactive nuclei are distinguished in the chart, not only by the fact that in their squares a lifetime appears, but also by the arrows which indicate their process of decay. β-active nuclei are distinguished by arrows which point toward the lower right if negative electrons are emitted or by arrows in the opposite direction if positive electrons are emitted. Nuclei which do not have enough energy to emit an electron but capture an atomic electron are indicated in the same way as an ordinary positive electron emitter. Some nuclei may decay both by positive and negative electron emission. This is indicated by two arrows attached to the squares. Alpha-activity of the nuclei is shown by an arrow in the lower left-hand direction and extending to the second diagonal neighbour. Thus in every case the arrow ends on the product of the radioactive decay.

The chart was devised by E. Segrè (1947) and includes added data from the table of isotopes by G. Seaborg *et al.* (1953).

The chart shows several interesting facts. Among the light nuclei only those with approximately equal numbers of neutrons and protons are stable. Those nuclei which have a great neutron excess are β-active and emit negative electrons, thus transforming a supernumerary neutron into a proton. Nuclei having too many protons emit a positive electron and transform a proton into a neutron. The fact that among light nuclei an equal number of neutrons and protons seems to give greatest stability to the nucleus is the result of the exclusion principle. The first neutrons and protons that build up a nucleus will occupy the lowest energy states. Each additional neutron and proton will be forced into an orbit of higher energy. If the number of neutrons greatly exceeds the number of protons, the last neutron will find itself in a state of rather high energy, while states of lower energy are still available for protons. Thus energy may be released by the transformation of a neutron into a proton. A similar argument holds for an excess of protons.

As the number of protons and neutrons becomes greater the stable nuclei tend to have a greater number of neutrons than protons. The reason for this is the electrostatic repulsion between protons. Because of this replusion the presence of many protons in the nucleus causes an increase of the energy of the nucleus and transforming a proton into a neutron will correspondingly lower the energy. Too great a neutron excess will be prevented for the reasons discussed in the preceding paragraph.

It has been mentioned that the electrostatic repulsion in heavily charged nuclei gives rise to α-activity. The frequent occurrence of α-activity in the last elements of the table can be readily observed. Instability of nuclei caused by the excess charge is probably the reason why fewer isotopes of heavy nuclei are known and why nuclei having more than 92 charge units do not occur in nature.

While two neutrons and two protons can never occupy exactly the same state within a nucleus, a pair of such particles may be found in the same orbit. These two particles must differ in the orientation of their spins. It seems that two particles in the same orbit possess similar energies. The result is that two successive particles can be bound in a low-energy state, while the addition of a third particle will release considerably less binding energy. This circumstance is illustrated by two facts in the table of nuclei. First, few stable nuclei exist in which both the number of neutrons and the number of protons is odd. Such nuclei are usually radioactive, emitting a positive electron, a negative electron or both. The decay product is a nucleus in which both neutron and proton numbers are even and all orbits may be considered as doubly occupied. The result of this rule is that nuclei with odd charge number, Z, possess many fewer isotopes than nuclei of even charge number. The other fact appearing from the table is that in nuclei of even charge number the even isotopes, in which the number of neutrons is even, have a greater abundance than the odd isotopes, in which the number of neutrons is odd. It seems that the latter nuclei, containing particles in less stable orbits, originally have been formed in smaller numbers than the isotopes having an even number of neutrons and greater binding energies.

Among the β-active nuclei two general rules may also be observed. First, that β-active nuclei which are located close to stable nuclei usually decay with a long lifetime. Nuclei which are located farther from stability have shorter decay periods. The other regularity is that radioactive nuclei containing even numbers of protons and neutrons have longer lives than nuclei containing an even number of neutrons and an odd number of protons or an even number of protons and an odd number of neutrons. These nuclei in turn live longer than nuclei in which both the proton and neutron numbers are odd. These regularities may be understood in terms of the energies of nuclei. In terms of β-decay it has been mentioned that the lifetime will be short if a great amount of energy is liberated in the β-decay. The lifetime will be long if the transformation energy is small. The transformation energy is apt to be less if the decaying nucleus has relatively low energy. This will be the case if the nucleus is near the region of stability and if the nucleus contains an even number of neutrons and protons. Closer inspection of the table will show that the rules just mentioned are not universally valid and that there are quite a few exceptions. These exceptions occur whenever a β-decay of the anomalous type is encountered, in which case, as has been mentioned, β-active substances have a relatively long lifetime.

The abundances of isotopes show a further marked regularity. Among the light elements the heaviest isotopes are frequently present in small abundance. Among the heavier elements the situation is reversed. It seems impossible to explain this fact on the basis of the stability of nuclei alone and it is likely that a hint is encountered here which may throw some light on the origin of the elements.

In this connection it is also of great interest to compare the abundance of various elements. The determination of the abundance of elements is much more difficult than the measurement of the ratio of isotopic abundances. The reason for this is that while isotopic composition is remarkably constant, at least in terrestrial materials, the mixtures of various elements depend quite strongly on whence one obtains the mixture. Other elements will be found to predominate in the crust of the earth than in meteorites, which are believed to have a composition similar to the interior of the earth. A still different composition is found in the study of the sun. Even if we restrict ourselves to the earth's crust, a different result is obtained if igneous rocks are studied, sedimentary materials, the sea or the atmosphere. Fig. 5 gives the best available guess as to the abundance of various nuclear species through-

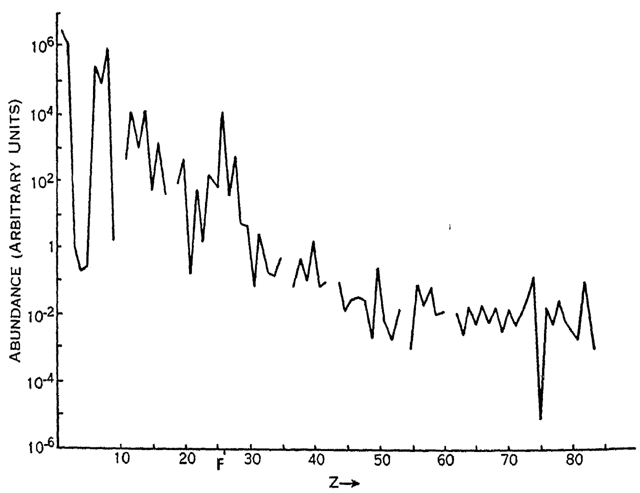

FIG. 5 —GRAPH OF ABUNDANCE OF ELEMENTS IN COSMOS AS A FUNCTION OF Z

out the cosmos. Fig. 5 is based on data taken from calculations of V. M. Goldschmidt. The units of the abundance are arbitrary. The abundance of Si has been set equal to 10,000 and all other abundances have been scaled in proportion.

The very great abundances of hydrogen and helium are immediately apparent. It will also be noticed that the lighter elements up to and including iron are much more abundant than the heavier elements. This has led to the suspicion that the lighter and heavier groups of elements have been formed by two basically different processes.

NUCLEAR STRUCTURE AND NUCLEAR FORCES

We are ignorant about the origin and nature of the nuclear forces. There is not even certainty that it is permissible to talk about forces within a nucleus in the customary sense of the word. Something is known, however, about the magnitude that forces between nuclear particles should have if these forces are to give rise to the effects that are observed.

A detailed theory of the interaction of slow neutrons with nuclei leads to the idea that there is very little interaction between the neutron and the nucleus until the neutron approaches to the distance of approximately one nuclear radius. At that distance the neutron is attracted to the nucleus with a strong force. The last statement is based on the fact that the union of a neutron with almost any nucleus releases a binding energy of several Mev. The facts so far described are summarized in the statement that the interaction between the neutron and other nuclear particles is a strong, short-range attraction.

If a proton approaches a nucleus the interaction at long distances is an electrostatic repulsion. By nuclear forces, of course, is meant the forces acting in addition to these electrostatic forces. As long as the proton is not in contact with the nucleus the effects of nuclear forces are considerably smaller than this electrostatic interaction. Attaching a proton to a nucleus releases a similar energy as when a neutron is attached. Thus, the interaction of the protons with other nuclear particles is again a strong, short-range attraction to which, of course, must be added the electrostatic repulsion, which acts over a greater distance.

Comparison of the binding energies of certain pairs of light nuclei leads to an important conclusion concerning nuclear forces. The first of these pairs is H^3 and He^3. The former consists of two neutrons and a proton, the latter of one neutron and two protons. The second known pair in the series is Li^7 and Be^7. The first is composed of three protons and four neutrons, the second contains four protons and three neutrons. The next pair is B^{11} and C^{11}, in which the numbers of protons and neutrons are five-six and six-five, respectively. In each of these pairs one member is obtained from the other if all neutrons are replaced by protons and all protons by neutrons. A large number of additional pairs of this type are known. For quite a few of these accurate determinations of the energy content of the nuclei are available. These energy contents differ because of the greater electrostatic repulsion prevailing in the nucleus which is more heavily charged than its partner. The remarkable fact is that the electrostatic repulsion is sufficient to explain the observed energy difference of the two nuclei in any of these pairs. We conclude that nuclear forces remain unchanged upon replacing all neutrons by protons and all protons by neutrons.

More detailed investigation of the behaviour of nuclei and also scattering experiments of protons on protons and neutrons on neutrons at various energies have led to a simple general rule. This is that neutrons and protons interact with each other in the same way as they interact with their own kind and that neutrons and protons are bound by the same forces within nuclei.

A detailed study of the proton-proton and neutron-neutron scattering at various energies has led to the conclusion that during such a scattering process the two interacting particles may exchange their charges. This exchange process gives rise to forces between the particles. It is likely, however, that these exchange forces account for only a portion of the total forces acting within nuclei. In spite of the similarity of the behaviour of neutrons and protons, the charge does therefore influence nuclear binding, but it does so in a similar way as the spin. Particles with different charge or different spin may occupy the same orbit, whereas particles with the same charge and spin may not. Furthermore, the exchange of charge and spin exerts an influence upon the nuclear forces.

It is instructive to consider what happens if the lightest nuclei are built up by adding one neutron or one proton at a time. The first combination, that of a neutron and a proton, has a relatively low binding energy of 2.2 Mev. A somewhat greater binding energy is released if a neutron or proton is added (the values are 6.2 Mev and 5.4 Mev, respectively). If a fourth particle is attached in such a way as to build a helium nucleus a very great amount of binding energy is released. The total binding energy of the two neutrons and two protons in the helium nucleus is 28 Mev. The great stability arising from this large binding energy accounts for the appearance of α-particles in radioactive decay. If we now try to attach an additional neutron or proton to the α-particle we find that the fifth particle will not be bound at all. This will seem all the more remarkable if one considers that the α-particle is the only nucleus which fails to combine with a proton or a neutron. A glance at the chart of the previous section will show that atomic number 5 is the only one absent among the nuclei up to atomic number 246.

This situation is undoubtedly connected with the fact that according to the exclusion principle four and only four particles can be placed in the same orbit. Two particles in the same orbit must differ either in spin or charge or both. Now a nuclear particle can take two spin directions and two charge values (O for neutrons and $+1$ for a proton). Thus the maximum number of particles in the same orbit is four and we must consider the He^4 nucleus to consist of two neutrons with opposite spins and two protons with opposite spins. Since a fifth particle cannot differ by charge or spin from the four previous particles, the application of the exclusion principle indicates that the fifth particle must be accommodated in a new orbit. As a consequence, this particle will be more loosely bound and might, in fact, have a binding energy equal to zero. Properties of matter inside nuclei heavier than the helium nucleus have certain simple common characteristics. In particular, nuclear densities for these nuclei seem to be fairly constant so that the cube of the radius is proportional to the mass number, A, that is to the number within the nucleus. The total binding energy of the nucleus is also proportional to this number so that the binding energy per nucleon is constant. This latter statement does not apply very well to the heaviest nuclei for which the binding energy per nucleon shows a marked decrease. This, however, is caused by the coulomb repulsions between the protons within the nucleus rather than by any intrinsic change in the characteristic behaviour of nuclear matter itself. The fact that the volume and binding energy per nucleon is roughly a constant for all nuclei beyond helium has been ascribed to a "saturation" of nuclear forces. Apparently in the helium nucleus the nucleons have achieved a nearly optimal density and binding energy.

Many of the detailed properties of the nuclei were explained by the nuclear shell model (M. G. Mayer, H. Jensen *et al.*, 1949). According to this model, individual nucleons are found in well-defined orbits within each nucleus. Each of these orbits is characterized by an orbital angular momentum, *i.e.*, a momentum around the centre of the nucleus; by a radial momentum, *i.e.*, a momentum away from and toward the centre of the nucleus; and a total angular momentum which is composed of the orbital angular momentum and the one-half unit spin momentum of the nucleon. Increasing angular momenta and radial momenta correspond to increasing energies. According to the Pauli exclusion principle, each orbit characterized by the appropriate momenta and by the spin may contain not more than one neutron and one proton. The orbits are filled in successively, those with lowest energy being filled first. The energies of these orbits can be calculated and one can therefore predict in which order the orbits of various characteristics will be filled up. One finds that a surprisingly low energy is encountered whenever an orbit has practically no radial momentum, that is, whenever the path of the nucleon can be con-

sidered as circular, provided that the angular momentum of the orbit and the angular momentum corresponding to the spin are lined up parallel to each other. There are several orbits of the kind just described which differ from each other by their orientation in the spherical field of the nucleus. When all these relatively low-lying orbits are filled up, one obtains a closed shell configuration and one arrives at a particularly stable nucleus.

The procedure mentioned above agrees with experiments particularly well for heavier nuclei. Application of these ideas shows that nuclei with unusual stability will result if the neutron number or the proton number happens to be either 50, 82 or 126. Stability of such nuclei was noticed before the explanation was given. The peculiar properties of the corresponding nuclei led to the designation of "magic numbers" for the numbers 50, 82 and 126. It is of interest particularly to mention the nucleus Pb^{208}, which is "doubly magic" since it contains 82 protons and 126 neutrons.

The nuclear shell model has been most useful in predicting angular momentum values for a great number of nuclear isotopes both in their lower state and in their excited state. The possibilities of β-decay and also the possibilities of emission of γ-rays are closely connected with these angular momenta. Therefore the shell model made it possible to obtain a consistent connection between β-decays, γ-ray emissions and detailed nuclear structure.

The explanation of nuclear structure by the shell model is similar to the explanation of the periodic system with the help of the shell model of the electrons within atoms. A quantitative difference exists, however, in that in atomic physics the difference between incomplete shells and closed shells is more marked than it is in nuclear physics.

The nuclear shell model suggests that nucleons can move across nuclei in a relatively undisturbed manner. Indeed, if that were not so, it would be hard to understand why well-defined orbits may be ascribed to individual nucleons. This conclusion is somewhat surprising since all nucleons experience strong forces when entering or leaving a nucleus. We are therefore led to the following model of nuclear forces. When a nucleon approaches a nucleus, it is attracted into the interior of the nucleus and is therefore strongly accelerated. Inside the nucleus, the nucleon does not encounter any strong systematic change of the potential and is not exposed to any appreciable average force. It moves in this region almost as though the inside of the nucleus were free space. When leaving the nucleus, the nucleon will experience a strong retarding force, and will lose the kinetic energy which it acquired upon entering. The above discussion ignores the possibility of an energy loss of the nucleon which it may suffer while traversing the nucleus but it gives a qualitative idea of the forces found inside a nucleus.

The nature of nuclear forces cannot be understood unless one considers both the field in a quiescent nucleus and that in a nuclear structure whose components experience violent motion and acceleration. The situation may be clarified by a comparison with the electric forces which confine the electrons to their orbits within the atoms. These forces have actually two manifestations. On the one hand, they influence the orbits of the electrons. On the other hand, they give rise to electromagnetic radiation. The latter phenomenon occurs when the electric configuration within an atom suffers a sudden change and part of the electric field in the neighbourhood of the atom is shaken loose.

The situation is similar in the case of nuclear forces. On the one hand, they confine nucleons to their orbits. On the other hand, one has to expect that if a nucleus is subject to sudden and violent change, a peculiar nuclear radiation will be emitted. This nuclear radiation has been identified with at least some of the mesons which have been described above.

The nuclear radiations, that is, the mesons, differ in two basic respects from electromagnetic radiation. The first difference is that electromagnetic radiation may carry an arbitrarily small amount of energy. A meson, on the other hand, cannot carry an energy less than a certain given minimum amount. To this minimum energy a mass corresponds, according to Einstein's relation of equivalence of mass and energy. For the π-mesons, which have been most closely identified with nuclear radiation, this mass is approximately 270 times greater than the mass of the electron and is roughly one-seventh of the mass of a nucleon. The fact that the nuclear radiation has a minimum energy is connected with the short range of nuclear forces. As a result of this short range the time of vibration of nuclear radiation will necessarily be shorter than a certain minimum time. According to the mechanics of atomic systems, short times are necessarily connected with high energies. The existence of the mesons as a form of nuclear radiation was first postulated by H. Yukawa. These mesons were then found in cosmic radiation and later in nuclear reactions and they possessed the qualitative features which had been predicted.

The second important difference between electromagnetic radiation and nuclear radiation as represented by mesons is connected with the electric charge carried by the radiation. Electric radiation does not carry a charge. Many mesons do. The π-mesons which are known to be connected with nuclear forces appear in three forms: the neutral π-mesons, the positive π-mesons which carry one positive unit of electricity and the negative π-mesons which carry a negative unit. In their interaction with nuclear matter these three kinds of π-mesons behave quite similarly. This fact is connected with the rule mentioned above that nuclear forces act similarly on protons and neutrons. The spin of the π-mesons is known to be zero, that is, they do not carry an intrinsic angular momentum. Their mathematical description, however, exhibits a peculiar behaviour with respect to mirror reflections. It is a consequence of this peculiar property that emission of a π-meson does not in itself cause a change in the angular momentum of the emitting nucleon but it is likely to cause an exchange of angular momentum between the spin and the orbit of the nucleon.

Many other kinds of mesons have been observed and some of these may well be connected with nuclear forces in a manner similar to the connection existing in the case of the π-mesons. It will be, however, clear even to the most superficial observer that present hypotheses concerning nuclear forces have been introduced piecemeal, seem to consist of several independent statements and do not proceed by a cogent reasoning from a number of simple hypotheses. These are the marks of an unfinished theory. The final and complete explanation will probably contain unexpected elements and will probably form a more closed and simple pattern than the present disconnected set of assumptions.

ENERGY PRODUCTION IN STARS

The energy source responsible for the radiation of the sun and stars was the subject of speculation for many years. It was recognized long ago that no known chemical reaction could keep the sun supplied with energy for more than approximately 100,000 years. Yet there is geological evidence that the sun must have been radiating at its present rate for 500,000,000 years; *i.e.*, during the period in which living beings are certain to have inhabited the earth. More recent detailed theories of the interior of the stars did not lead to any suggestions as to some novel kind of chemical reaction (some kind of rearrangement of atoms or extranuclear electrons) which could account for the extremely great amounts of energy that the sun has emitted during its long history.

Somewhat more energy could be obtained from a slow gravitational contraction of the sun. It is not easy to construct a model of the sun (or stars), however, which would permit the sun to radiate at its present rate for more than a few million years without considerable change if gravitational energy were the main source of the energy radiated. Actually, a great concentration of mass near the centre of the sun could give rise to sufficiently high gravitational energies and a slow growth of this very dense core could account for the energy emission of the sun. In order to obtain the necessary energies one would have to assume near the centre of the sun densities of matter which are approximately 10^{12} times greater than the densities of water. Such high densities had been encountered only in the interior of nuclei.

It seems, therefore, most likely that the energy of the sun and stars results from nuclear transformations. The theory of the structure of the sun and stars has led to the conclusions that the

central regions of these bodies are at temperatures approximately 40,000,000° to 50,000,000° F. At these exceedingly high temperatures atomic nuclei move with sufficiently high velocities so that occasionally they come in close contact and give rise to a nuclear reaction. Actually the average energy of atomic nuclei inside the sun is only 2,000 or 3,000 ev. This energy is rather low compared with the energies usually encountered in nuclear reactions. If the kinetic energy in the sun were as high as the kinetic energy of protons or α-particles which are used in the laboratory to produce reactions, then nuclear reactions on the sun would probably go to completion in a very short time and the sun would explode, rather than produce energy at a steady rate. The small kinetic energy of nuclei in the sun has the consequence that nuclear reactions take billions of years to go to completion.

It is, of course, of interest to find out which specific nuclear reactions supply the energy of the sun. While there are numerous reactions which might, in principle, be considered, practically all of them were eliminated as the actual source. Some reactions would proceed too rapidly and result in burning up the nuclear fuel too quickly. Other reactions, in which heavily charged nuclei participate, proceed so slowly that they could not produce sufficient energy. In 1937 H. Bethe and others discussed this question and arrived at the conclusion that there are two series of reactions which jointly or separately may explain the behaviour of the sun and the stars. One of these series is the following: a proton collides with a C^{12} nucleus and is captured; the capture process is accompanied by the emission of γ-rays; the resulting N^{13} nucleus is β-active and transforms into C^{13}; a second proton collides with the C^{13} nucleus and is captured, again emitting γ-rays; by this process a stable N^{14} nucleus is formed; the latter captures a proton, emitting the capture energy as γ-rays; an O^{15} nucleus results; this nucleus is β-active and transforms to N^{15}; finally a collision of a proton and N^{15} gives rise to C^{12} and an α-particle. This series of reactions can be summarized in the following formulas:

$$C^{12}+H^1\rightarrow N^{13}+\gamma$$
$$N^{13}\rightarrow C^{13}+e^+$$
$$C^{13}+H^1\rightarrow N^{14}+\gamma$$
$$N^{14}+H^1\rightarrow O^{15}+\gamma$$
$$O^{15}\rightarrow N^{15}+e^+$$
$$N^{15}+H^1\rightarrow C^{12}+\alpha.$$

It will be noted that as a result of the series four hydrogen nuclei have disappeared and one helium nucleus has been formed. The original C^{12} nucleus has been reproduced at the end of the reactions. Apart from the energy released in γ-rays and kinetic energy, the net reaction can be written:

$$4H^1\rightarrow He^4+2e^+.$$

Indeed, hydrogen and helium seem to be the most abundant constituents of the sun. We have seen in earlier discussions that the building up of the helium nucleus releases more energy per unit mass than any other type of nuclear reaction. Thus the proposed mechanism employs the most abundant materials in the sun in the most effective manner.

The other series of reactions is the following:

$$H^1+H^1\rightarrow H^2+e^+$$
$$H^2+H^1\rightarrow He^3+\gamma$$
$$He^3+He^3\rightarrow He^4+H^1+H^1.$$

The net result is the same as in the previous series, namely the transformation of four protons and two electrons into a helium nucleus

The idea has often been expressed that the same reaction which provides the sun with its source of energy could be utilized by man. The materials involved in the reactions described above are among the most common on earth. Nevertheless it remains apparently impossible to use these reactions in our industries as useful sources of energy. The required steady release of energy would be possible only if materials as hot as encountered near the centre of a star were available. The difficulties that would be encountered in handling such materials are appalling.

UTILIZATION OF THE ENERGY OF THE NUCLEUS

Release of nuclear energy for practical purposes has become possible in recent years. The processes involved are different, however, from the processes occurring spontaneously in the sun. In the latter reactions nuclei of low atomic numbers participate. On the other hand, the reactions utilized by ourselves involve nuclei of the highest charge.

If a uranium or thorium nucleus is hit by a neutron of appropriate energy nuclear fission results with considerable probability (*see* section on nuclear reactions). The two approximately equal fragments into which the nucleus separates carry a total energy of almost 200 Mev in the form of kinetic energy. Some of the energy released is present as internal energy of the fragments and a part of this internal energy splits neutrons off these fragments. As a result of each fission process a few neutrons are obtained in addition to the fission fragments. These neutrons can enter further heavy nuclei, they cause fission and give rise to more neutrons. In each one of the steps the neutrons are multiplied. This results in a rapid increase in the total number of fissions and leads, within a short time, to a number of neutrons and a number of fissions comparable with the number of nuclei in the available material. The multiplication of neutrons and the corresponding multiplication of fission processes is called a chain reaction. This repeatedly branching chain of reactions makes it possible that starting with a few neutrons one may end with so great a number that a substantial fraction of the myriads of nuclei is eventually involved in the process.

The simple type of chain reaction described here explains the functioning of the atomic bomb. When this reaction is initiated in an appropriate piece of material, energy is released so rapidly that a violent explosion results. In explosions carried out so far the energy released is equivalent to that produced by many thousands of tons of T.N.T. Fortunately none of the materials occurring in nature is capable of supporting a simple chain reaction that would give rise to an "atom bomb" type of explosion. In both thorium and ordinary uranium an additional reaction exists which competes with the fission process and renders the process harmless. This competing process is the absorption of a neutron in thorium or U^{238} according to the reactions:

$$Th^{232}+n\rightarrow Th^{233}+\gamma$$
$$U^{238}+n\rightarrow U^{239}+\gamma.$$

In order to produce atomic bombs materials are needed in which competing processes do not occur. Such a material is U^{235}, an isotope which occurs in the natural mixture of uranium with an abundance of 0.7%. Separation of this isotope from naturally occurring uranium was carried out on a large scale in the United States during World War II.

Another material which can support a simple chain reaction and which can be used in atomic bombs is Pu^{239}. Plutonium is an element which carries two more charges than uranium and is the first element that has been artificially made and handled in considerable quantity. Plutonium is obtained from the abundant isotope of uranium, U^{238}. As mentioned above, neutron bombardment transforms this element to U^{239}. This material by two successive β-decay processes becomes Pu^{239}. The latter material was also produced in the United States during World War II.

Energy of the fissionable materials may also be released in a steady manner without any explosion. In order to accomplish this, the energy released in the fission processes must be removed by heat conduction. The energy which has been conducted can then be utilized as a source of power. The excess neutrons created in the fission process must also be absorbed so that instead of a multiplying chain reaction there is a chain reaction in a steady, self-sustaining state. In the process of neutron absorption frequently artificial radioactive products are generated which can be used in research and for medical purposes.

Up to the mid-1950s, the use of nuclear reactors in producing activities for research had been perhaps of greatest importance. This usefulness is due to the fact that a radioactive atom has precisely the same chemical behaviour as its known radioactive counterparts or isotopes. Thus a radioactive carbon or sulphur atom will behave precisely in the same way as a normal carbon or sulphur atom. Because of its activity, however, it can be easily discovered in the most minute quantities. Thus, one can trace the path of substances introduced into a living system or into a piece of machinery through-

out its passage and incorporation in the system.

There is no difficulty in constructing a reactor in which the neutron population remains steady. In order to accomplish this, the neutrons produced in fission must be disposed of either by absorbing them in other nuclei or by allowing them to escape through the surface of the system. In every case one will construct the chain reacting system in such a way that the ratio between neutron loss and neutron gain can be regulated. The regulation can be achieved by lowering into the reactor a neutron-absorbing substance such as a rod containing boron. Neutrons are then consumed in the reaction

$$B^{10}+n\rightarrow Li^{7}+He^{4}.$$

When the system starts to operate there are only a few neutrons around, produced by the cosmic rays or other causes. The neutron-absorbing substance is then withdrawn so that the neutron loss becomes less than the gain of neutrons caused by fissions. The neutrons start to multiply and soon the neutron density and the rate of fission reaches the level at which the system is to be operated. At this time the neutron-absorbing rod is reinserted to an extent that neutron absorption and neutron production are just equal. When the operation of the system is to be shut off, the neutron-absorbing substance is pushed in farther so that the neutron loss exceeds neutron production. The number of neutrons then decreases to the small value that it had originally.

The rate at which such a system releases energy is proportional to the neutron density. The density, in turn, may be regulated at will by choosing the instant at which the neutron-absorbing material is reinserted into the pile and the increase in neutron density is stopped. From a practical point of view the rate of energy release is limited, however, because it is possible to carry out of the system a limited amount of energy in the form of heat. If more energy is produced than can be carried away, this results in an increased temperature of the entire system. As a consequence the system may shut itself off or, failing to do this, may blow up. The main problem to be solved is, therefore, not the production of energy but its control and utilization.

The regulation of the level at which the neutron density is to be kept is greatly facilitated by the fact that some of the neutrons are produced in the fission process with some delay. The delay results from the fact that some fragments of fission undergo a β-decay before they emit a neutron. The lifetime of such a β-decay process ranges from a second to a minute and neutrons are emitted with delays of corresponding duration. These delayed neutrons are utilized in operating the chain reacting system. The system is operated under such conditions that the neutrons produced instantaneously in the process are slightly fewer than the neutrons absorbed or otherwise lost in the system. Under the circumstances the reacting system always has to wait for these delayed neutrons in order that effective neutron multiplication can take place. The multiplication of neutrons is thus slowed down and there is plenty of time to adjust the neutron-absorbing material when the neutron density and energy production approach the desired values, or when there is an excessive increase in power production.

It is possible in principle to construct chain reacting systems of rather small extension and small weight. Nevertheless it is impossible to employ such devices as light and concentrated energy sources such as would be highly desired in aircraft. The reason is that the fission process and also later nuclear processes accompanying it emit considerable amounts of radiation in the form of neutrons, β-rays and γ-rays. If these radiations were allowed to escape everyone who approached the chain reacting machine would be killed. The system must be surrounded with an absorbing shield which is thick enough to reduce these dangerous radiations to an exceedingly small fraction of their original intensity. In order to achieve this purpose the shield must be heavy. This sets a severe limitation on the use of nuclear energy in machines that are small and easily moved. It is nevertheless expected that nuclear energy will prove extremely useful. While the apparatus which produces energy is of necessity both heavy and bulky, once it is set up it can function for a long time without being supplied with additional nuclear fuel. In the long run added fuel will be needed but the weight of the raw material is completely negligible compared with the weight of the coal needed for the same energy production. Thus nuclear power plants are independent of heavy raw materials. At the same time they will be more easily constructed than hydroelectric plants.

The materials which can be most easily used in constructing nuclear power plants are the same as those needed for the atomic bomb. They are the materials in which nuclear fission occurs with greatest ease without too many competing processes which absorb neutrons. It is also possible to build up a nuclear power plant using only common uranium, a substance which cannot be used in atomic bombs. The reason for this is the following. Ordinary metallic uranium cannot sustain a nuclear chain reaction because more neutrons are absorbed in the isotope, U^{238}, than are produced by fissions in both isotopes. Neutron multiplication can be obtained if some appropriate material, such as carbon, is added to the system. The neutrons produced in fission are slowed down by repeated collisions with carbon nuclei. Finally the neutrons are transformed into thermal neutrons and the slowing down process ends. The U^{235} reacts preferentially with these slowed-down neutrons. In spite of the fact that U^{235} is present in the normal isotopic mixture to an extent of 0.7%, successful collisions between slow neutrons and U^{235} become frequent enough to give rise to a sufficient number of fissions and an excess of neutron production. The processes described need only common materials like uranium and carbon, but the neutron excess obtained in this way is small and losses must be carefully avoided. Such neutron losses always occur at the surface of the chain reacting system. These surface losses can be reduced by making the machine bulky.

If a chain reacting system is built up from ordinary uranium many of the neutrons produced are absorbed in the abundant U^{238}. The resulting U^{239} decays into Pu^{239}, a material which is usable in more convenient plants and also in atomic bombs. It should be noticed that every process of useful atomic energy production is closely connected with the destructive use which can be made of this great energy source. The machines described above either use the atomic explosive as fuel or else produce the atomic explosive during their operation. The constructive and destructive uses of nuclear energy are therefore very closely related. (E. TE.; M. L. A.)

NUER: *see* NILOTES.

NUEVA SAN SALVADOR (SANTA TECLA), the capital of the department of La Libertad, El Salvador; on a branch railway from San Salvador (10 mi. N.). Pop. (1950) 18,313. The town was founded in 1854 and intended to replace the capital, San Salvador, which was ruined by an earthquake in that year but soon afterward rebuilt.

NUEVO LEÓN, a northern state of Mexico. Pop. (1944) 625,780, with no native Indians; (1950) 743,297. Area, 25,130 sq.mi., with its capital at Monterrey (*q.v.*). Crossed by paved trunk highways and railways between Laredo, Texas, the gulf port of Tampico, and Mexico City, the state is a major industrial section and an important agricultural region lying just north of the Tropic of Cancer. With an average altitude of about 5,500 ft., the Sierra Madre Oriental runs southeasterly through the state, which lies on the easterly and northern slopes of the Mexican plateau. The climate is arid and semi-arid in the north, where sandy wastes are covered with cactus and scrub. The eastern slopes are endowed with vegetation, and the mountainous sections are covered with forests; subtropical valleys in the east permit sugar-cane cultivation.

With scanty rainfall, Nuevo León has a dry, generally healthful climate which is temperate on the elevated parts. Though there are a number of rivers and streams, none is navigable; the largest is the Rio Salado. Water for irrigation is in part drawn from the international Falcón dam, jointly constructed by Mexico and the United States for hydroelectric power, flood control and agricultural purposes.

Nuevo León produces few minerals, but quantities of sugar, cereals (especially maize and wheat) and vegetables. Its fibres have importance, notably *ixtle* from agaves (cactus), which also

furnish distilled liquor, *mescal.* The main importance of Nuevo León lies in its industries.

Its iron and steel works and smelting plants were the first heavy industry in Latin America, and in addition it supports numerous textile enterprises and other light industrial activities. It has a well-developed rail net. (HD. C.)

NUISANCE, that which gives offence or causes annoyance, trouble or injury. In English law nuisance is either public or private. A public or common nuisance is defined by Sir J. F. Stephen as "an act not warranted by law, or an omission to discharge a legal duty, which act or omission obstructs or causes inconvenience or damage to the public in the exercise of rights common to all His Majesty's subjects" (*Digest of the Criminal Law*). A private nuisance is an act or omission which causes inconvenience or damage to a private person. There must be some sensible diminution of these rights affecting the value or convenience of the property. "The real question in all the cases is the question of fact, whether the annoyance is such as materially to interfere with the ordinary comfort of human existence" (Lord Romilly in *Crump* v. *Lambert,* 1867, L.R. 3 Eq. 409). A private nuisance, differing in this respect from a public nuisance, may be legalized by uninterrupted use for 20 years. (*See* ANNOY.) The remedy for a public nuisance is by information, indictment, summary procedure or abatement. An information lies in cases of great public importance, such as the obstruction of a navigable river by piers. In some matters the law allows the party to take the remedy into his own hands and to "abate" the nuisance. Thus, if a gate be placed across a highway, any person lawfully using the highway may remove the obstruction, provided that no breach of the peace is caused thereby. The remedy for a private nuisance is by injunction, action for damages or abatement. An action lies in every case for a private nuisance; it also lies where the nuisance is public, provided that the plaintiff can prove that he has sustained some special injury. In such a case the civil is in addition to the criminal remedy. In Scotland there is no practical distinction between public and private nuisances, the remedy against either being interdict or damages. The law as to what constitutes a nuisance is substantially the same as in England.

There is a list of statutory nuisances in the Public Health (Scotland) Act 1867, and amending acts. The American law on the subject is practically the same as the English law.

NUKHA, a town of Russia in the Azerbaijan S.S.R. in 41° 11′ N., 47° 8′ E., on a winding road linking Baku with Tiflis, and on the Nakhichevan river. Pop. (1933) 26,300. It is occupied in the breeding of silkworms and has five silk spinning factories. Hajji Chelyabi, the founder of the khanate of Sheki, chose the town as his residence in the 18th century and it remained the capital of the khanate until 1819, when it finally became Russian.

NULLIFICATION, the process of making null or of no effect (Lat. *nullus,* none). In United States history the term is applied to the process by which a state either (*a*) in fact suspended, or (*b*) claimed a constitutional right of suspending, the operation of a federal law within its own territory. The doctrine of nullification as a constitutional theory was probably never held by a majority of the states or of the American people at any one time, though before 1860 most of the states asserted or practised it. The belief in nullification was based on the theory that the union of the states was a voluntary one, each member retaining its sovereignty, though for purposes of convenience delegating certain powers of government to an agent—the federal government. The powers of this agent were strictly limited by the Constitution, and should it transcend these powers the states must interpose to protect their rights. This view held that the Supreme Court created by the Constitution was not a proper tribunal to decide causes arising beyond the Constitution or relating to the nature of the Union, but that its jurisdiction was limited to cases arising under the Constitution. If the Federal Government usurped a right belonging to the state, the latter, being a sovereignty, must judge for itself.

As later perfected by John C. Calhoun (*q.v.*), the theory of nullification required a practice as follows. A state aggrieved by a law of the Federal congress might, in constituent convention, suspend the operation of the objectionable law, and report its action to the other states. If three-fourths of them decided that the law in question was not unconstitutional, then in effect it became ratified (*see* United States Constitution, art. v). The dissatisfied state must then submit or draw out of the Union by secession (*see* SECESSION and CONFEDERATE STATES OF AMERICA).

The earliest assertions of the doctrine of nullification are found in the Kentucky and Virginia resolutions of 1798–99, written respectively by Thomas Jefferson and James Madison in protest against the Alien and Sedition Acts of Congress. Nullification was first practised in 1809 by Pennsylvania, the governor ordering out the state troops to resist the execution of a decree of a Federal court. In the New England states, 1809–15, the United States laws relating to embargo, non-intercourse and army enlistments were nullified by state action. From 1825–29 the state of Georgia forcibly prevented the execution of Federal laws and court decrees relating to the Indians within her borders and in Alabama, 1832–35, there was a similar nullification. The only example of nullification in which theory and practice coincided was the nullification in 1832 by South Carolina of the Federal tariff laws. In this the state acted upon the theory outlined above which was perfected by Calhoun. In the last decade before the Civil War 14 of the Northern states in the so-called "Personal Liberty laws" nullified the Federal statutes relating to slaves and slavery by making it a crime for their citizens to obey these laws. Since the Reconstruction the Southern states have in practice effected a nullification of the Fourteenth and Fifteenth amendments to the Constitution providing for negro suffrage.

See John C. Calhoun, *Works,* vols. i. and vi. (1853–55); D. F. Houston, *Critical Study of Nullification in South Carolina* (1897); C. W. Loring, *Nullification and Secession* (1893); E. P. Powell, *Nullification and Secession in the United States* (1897); and U. B. Phillips, *Georgia and States Rights* (Washington, 1902); D. W. Howe, *Political History of Secession to the Beginning of the American Civil War* (1914); C. S. Boucher, *The Nullification Controversy in South Carolina* (Chicago, 1916); P. M. Hamer, *The Secession Movement in South Carolina, 1847–52* (Allentown, Pa., 1918); L. T. Lowery, "Northern Opinion of Approaching Secession," *Smith College Studies in History,* vol. 3 (Northampton, Mass., 1918); and E. S. Corwin, *John Marshall and the Constitution* (New Haven, Conn., 1919).

(W. L. F.)

NULLITY OF MARRIAGE, a judicial declaration that a marriage was null and void *ab initio* (from the beginning). In the 12th century the Roman law doctrine of nullity of marriage was developed in order to deal with hard cases under the principle of the indissolubility of marriage laid down by the Church of Rome, whose canons at that date governed the matrimonial law for the whole of Christendom. Nullity could be sued for on the grounds of affinity, into which the law of adoption entered very largely, or a previous unconsummated marriage, which latter was a ground for nullity in England as late as 1750. There were, and continue to be in Roman Catholic countries, various other grounds for nullity, but the grounds of nullity in England are at present limited to the following: (1) Where the parties are not by reason of age (14 for a male and 12 for a female), mental capacity, or otherwise capable of contracting marriage; (2) where the parties are within the prohibited degrees of affinity or relationship; (3) where one of the parties is already married; (4) where one of the parties does not freely consent to marry the other or does not understand the nature of the contract or ceremony; (5) where certain forms have not been observed; (6) where the form of marriage is essentially polygamous. Forms of marriage which offend against these rules are void *ab initio.* If at the time of the marriage one of the parties is and continues to be incapable of consummating the marriage by reason of some incurable physical defect, or of some incurable mental disability on the part of the man preventing him from consummating the marriage, or on the part of the woman resulting in her refusal of marital rights, the marriage may be annulled on the petition of the other party. A person may claim as a ground of nullity that he or she was insane at the time of the marriage. For the prohibited degrees of affinity *see* MARRIAGE.

The Royal Commission on Divorce which reported in 1913

recommended the following additional grounds of nullity of marriage: (1) When the other party, though of sufficient understanding to consent to a marriage, is at the time of the marriage either of unsound mind in other respects, or in a state of incipient mental unsoundness which becomes definite within six months after marriage, and the first party is at the time of the marriage ignorant of the defect, provided that (*a*) the suit is instituted within a year of the celebration of the marriage; (*b*) there has been no marital intercourse after discovery of the defect; (2) where the other party at the time of the marriage is subject to epilepsy or to recurrent insanity, and such fact is concealed by such party or his or her parents or either of them, or by anyone who has control over such party and is aware of the intended marriage, and the first party remains ignorant of the fact at the time of the marriage, subject to the same limitations for petitioning as in (1) above; (3) where one of the parties at the time of the marriage is suffering from a venereal disease in a communicable form, and the fact is not disclosed to the other party; (4) where a woman is pregnant by some other man at the time of the marriage and the husband is ignorant of the fact; (5) where there has been wilful refusal, without reasonable cause to allow intercourse, and where in fact there has been no intercourse owing to such refusal. (*See* also DIVORCE.)

See W. Rayden, *Practice and Law in the Divorce Division* (2nd. ed., by C. Mortimer, 1926); Sir L. Dibdin, *Reformatio Legum Ecclesiasticarum*, vol. iii. (1912); Report of the Royal Commission on Divorce and Matrimonial Causes (1913). (W. LA.)

United States.—Three different situations relating to the nullity of marriage must be distinguished. A marriage may in the first place be totally void. No suit is necessary for its annulment and third parties can set up the fact of its invalidity. This, for example, is generally true of a bigamous marriage. Secondly, a marriage may be voidable at the election of one of the parties. No judicial decree is in theory necessary, though it is customary to secure a judicial declaration of nullity. Non-age of a party generally permits him thus to avoid the marriage, rendering it invalid *ab initio,* but until avoided by the act of the party it is valid, and third parties have no rights to contest its validity. Thirdly, as in the cases of marriage within the prohibited degrees of affinity, a suit to annul the marriage may be essential and such suit must be brought within the lifetime of one of the parties. The decree of annulment also relates back to the time of the marriage. The chief tendencies manifested by the many statutes in this field, apart from specifying the grounds for annulment, relate to: preserving the legitimacy of children born prior to the decree of annulment; making all annulments dependent upon judicial action and, in some instances, permitting the court in its discretion to deny or withhold relief; limiting the right to sue for annulment to a short space of time after discovery of the cause for annulment; permitting courts to award alimony upon decreeing annulment; allowing the injured party to a subsisting marriage to bring suit for its annulment; permitting courts in their discretion to hold trials for annulment in camera.

The grounds for annulment commonly recognized are: bigamy, impotency, non-age, marriage within the prohibited degrees of affinity, non-compliance with an essential statutory formality, mental incapacity existing at the time of the marriage. Among grounds that are recognized in some States by legislation, though not generally recognized, are: fraud, duress or mistake in the granting of consent to marriage, wilful refusal of a party to consummate the marriage by sexual intercourse, venereal disease or other serious illness existing at the time of the marriage and unknown to the other party, pregnancy due to some third party at the time of marriage and unknown to the other party. The causes for annulment are now generally specified by statute and these vary from State to State. Wide legislative activity in this field is due to the fact that in the United States no courts succeeded to the jurisdiction of the English ecclesiastical courts. Consequently no action for annulment on grounds entertained by the English ecclesiastical courts could be maintained in the absence of statute though equity courts would entertain such actions on grounds other than the canonical disabilities Under such a theory the intervention of the legislature became necessary and in short time legislation expanded to bring the entire field within its control. (J. M. LA.)

NUMANTIA, an ancient hill fortress in northern Spain, in the province of Soria (Old Castile), overhanging the village of Garray, near the town of Soria, on the upper Douro. Here, on a small isolated high plateau in the middle of the valley, was the stronghold which played the principal part in a famous struggle between the conquering Romans and the native Spaniards during the years 154–133 B.C. Numantia was especially concerned in the latter part of this war from 144 onwards. It was several times unsuccessfully besieged. Once the Roman general Hostilius Mancinus with his whole army was compelled to surrender (137). Finally, Scipio Aemilianus, Rome's first and only general in that age, with some 60,000 men drew round the town 6 m. of continuous entrenchments with seven camps at intervals. After 15 months (134–133) he reduced by hunger the 6,000–8,000 Numantine soldiers, much as Caesar afterwards reduced Alesia in Gaul. The result was regarded as a glorious victory, and in Roman literature the fall of Numantia was placed beside the fall of Carthage. The site was, under the Roman Empire, occupied by a Roman town called Numantia, and the *Itinerary* tells of a Roman road which ran past it. It is to-day a "Monumento Nacional" of Spain, and has yielded remarkable discoveries to the skilful excavations of Dr. Schulten (1905–1910), who has traced the Celtiberian town, the lines of Scipio and several other Roman camps dating from the Numantine Wars. (F. J. H.)

NUMA POMPILIUS, second legendary king of Rome (715–672 B.C.), was a Sabine, a native of Cures, and his wife was the daughter of Titus Tatius, the Sabine colleague of Romulus. He was elected by the Roman people at the close of a year's interregnum, during which the sovereignty had been exercised by the members of the senate in rotation. Nearly all the early religious institutions of Rome were attributed to him. He set up the worship of Terminus (the god of landmarks), appointed the festival of Fides (Faith), built the temple of Janus, reorganized the calendar and fixed days of business and holiday. He instituted the flamens (sacred priests) of Jupiter, Mars and Quirinus; the virgins of Vesta, to keep the sacred fire burning on the hearth of the city; the Salii, to guard the shield that fell from heaven; the pontifices and augurs, to arrange the rites and interpret the will of the gods; he also divided the handicraftsmen into nine gilds. He derived his inspiration from his wife, the nymph Egeria, whom he used to meet by night in her sacred grove. After a long and peaceful reign, during which the gates of Janus were closed, Numa died and was succeeded by the warlike Tullus Hostilius. Livy (xl. 29) tells a curious story of two stone chests, bearing inscriptions in Greek and Latin, which were found at the foot of the Janiculum (181 B.C.), one purporting to contain the body of Numa and the other his books. The first when opened was found to be empty, but the second contained fourteen books relating to philosophy and pontifical law, which were publicly burned as tending to undermine the established religion.

No single legislator can really be considered responsible for all the institutions ascribed to Numa; they are essentially Italian, and older than Rome itself. Even Roman tradition itself wavers; *e.g.,* the *fetiales* are variously attributed to Tullus Hostilius and Ancus Marcius. The supposed law-books, which were to all appearance new when discovered, were clearly forgeries.

Cornewall Lewis, *Credibility of early Roman History,* ch. xi.; W. Ihne, *Hist. of Rome,* i.; E. Pais, *Storia di Roma,* i. (1898), where Numa is identified with Titus Tatius and made out to be a river god; J. B. Carter, *The Religion of Numa* (1906); O. Gilbert, *Geschichte und Topographie der Stadt Rom im Altertum* (1883–1885); and ROME: *Ancient History.*

NUMBER means a positive integer such as 17, a real quantity such as π or -2, or an element of any of various abstract mathematical generalizations of the system of positive integers and the system of real numbers. These generalizations include complex numbers, quaternions and other hypercomplex numbers, modular numbers and transfinite cardinal and ordinal num-

bers; all these types of numbers will be defined below.

POSITIVE INTEGERS

Definition of Cardinal Numbers.—The concept of a positive integer arose in prehistoric times from recognition of the fact that the number of elements in any class (say the number of sheep in a herd) can be represented in various ways (say by a pile of stones). The essential idea is that there must be a one-one correspondence between the sheep in the herd and the stones in the pile. By this we mean that it must be possible to pair off one sheep with each stone, in such a way that no sheep is counted twice, and no sheep and no stones are left over.

In the same spirit, modern mathematicians define a cardinal number as a mark associated with a class, and with all other classes in one-one correspondence with this particular class. Thus, the integer 5 is the mark associated with the class of fingers on a hand and with all other classes whose elements can be paired off with the fingers on a hand.

A large variety of marks to represent the different positive integers have been developed by different races. These are discussed elsewhere (*see* NUMERAL SYSTEMS). The positional notation developed by the Hindus and Arabs, in which the position of a digit to the left of the decimal point indicates the power of the radix or base ten involved, is incomparably superior to earlier systems. However, it is not to be supposed that the base ten has any unique qualifications.

Our interest here is not in systems of notation or effective computation (*see* ARITHMETIC; CALCULATING MACHINES), but in the fundamental ideas which underly the use of number. Two of these are addition and multiplication.

Addition and Multiplication.—If a and b are the integers (cardinal numbers) for two classes A and B having no elements in common, and if these classes be combined to form a new class S, then the integer s representing the class S is called the sum of a and b, and we write $s=a+b$.

From this definition we easily prove the commutative and associative laws of addition,

$$a+b=b+a, \tag{1}$$
$$a+(b+c)=(a+b)+c. \tag{2}$$

Here and below the equality sign means that the classes represented by the two sides of the equation can be placed in one-one correspondence. Thus, both $a+(b+c)$ and $(a+b)+c$ represent the combination of three classes A, B, C without common elements, having a, b, c elements, respectively.

Similarly, there may be a classes, each of which contains the same number b of elements, while no two of these classes have an element in common. If all these classes are combined to form a new class P, the integer p representing P is called the product of a and b, written $p=a\times b$.

From this definition, one can also prove the commutative and associative laws of multiplication,

$$a\times b=b\times a, \tag{3}$$
$$a\times(b\times c)=(a\times b)\times c, \tag{4}$$

as well as the distributive law, which asserts that

$$a\times(b+c)=(a\times b)+(a\times c). \tag{5}$$

Brief further discussions of laws (1)–(5) may be found elsewhere (*see* ASSOCIATIVE LAWS; COMMUTATIVE LAWS; DISTRIBUTIVE LAW); formal proofs may be found in textbooks on mathematics (*see* G. Birkhoff and S. MacLane, *A Survey of Modern Algebra*, ch. xii [1941]). Informal graphical proofs follow.

For example, $a\times b$ is the number of elements in a rectangular array of a rows and b columns; rotation through 90° converts this into a rectangular array of b rows and a columns. Again, $a\times(b+c)$ is the number of elements in a rectangular array of a rows and $b+c$ columns. This array is the sum of two rectangular arrays without common elements, having respectively a rows and b columns, and a rows and c columns. This is $(a\times b)+(a\times c)$.

The laws (1)–(5) are often called the five fundamental laws of arithmetic; in addition, the special unit law

$$a\times 1=a \tag{6}$$

is evident. Other laws also follow from a detailed logical analysis of the situation. For example, equality satisfies the reflexive law, that $a=a$; the symmetric law, that $a=b$ implies $b=a$; and the transitive law, that $a=b$ and $b=c$ imply $a=c$. Moreover, addition and multiplication are single-valued operations, so that if $a=b$, then $a+c=b+c$ and $a\times c=b\times c$. To explain the relation of such laws to our definitions, consider the statement that $a=b$ implies $a+c=b+c$. This means that if there is a one-one correspondence between two classes A and B, and if C is any class having no elements in common with A or B, then there is a one-one correspondence between the combination (sum) of A and C and that of B and C.

However, a good understanding of the laws of arithmetic is possible on the basis of (1)–(6) alone.

Ordinal or Inductive Definition.—In the last two sections the concept of a positive integer was based on the concept of a class and general principles of the logic of classes. But it is also possible to take a more formalistic view and to base arithmetic on laws (1)–(6) without referring to the idea that integers represent classes.

We must first know the order of the integers (*i.e.*, which positive integer follows which). Then if we start with the principle that $a+1$ is the successor of a (number following a), and apply repeatedly the special case

$$a+(b+1)=(a+b)+1, \tag{2'}$$

$c=1$ of the associative law, we readily get the addition table. Thus, we get $5+1=6$, $5+2=5+(1+1)=(5+1)+1=6+1=7$, etc.

Similarly, the multiplication table can be constructed ordinally from the unit law (6) and the following special consequence

$$a\times(b+1)=(a\times b)+(a\times 1)=(a\times b)+a \tag{5'}$$

of the distributive laws (5) and (6). Thus, we get $5\times 1=5$, $5\times 2=5\times(1+1)=(5\times 1)+5=10$, etc.

Hence, we can say that the identities (2), (5), (6) imply all the arithmetic of positive integers since they tell us how to add and multiply any two positive integers.

G. Peano put this principle in an even more striking form about 1900. He first characterized formally the sequence of positive integers by the following postulates: (i) each positive integer n has a successor, written n^+; (ii) $m^+=n^+$ implies $m=n$; (iii) there is just one positive integer, called 1, which is not the successor of any number; (iv) any set C of positive integers which includes 1, and which includes n^+ if it includes n, must include every positive integer. Condition (iv) is called the principle of finite induction; it is intuitively evident since C includes 1, includes $2=1^+$ since it includes 1, includes $3=2^+$ since it includes 2 and so on indefinitely. It is really used above when we state that (6) and (5′) define $a\times m$ for all m.

Peano then developed the entire arithmetic of positive integers from postulates (i)–(iv), without making any other assumptions. He first constructed the addition and multiplication tables as we did above, but introducing $m+1=m^+$, (2′), $m\times 1=m$ and (5′) as definitions. He then proved laws (1)–(5). The chain of reasoning involved is long (*see* C. C. MacDuffee, *An Introduction to Abstract Algebra* [1940]). We give here the special case $m+1=1+m$ of the commutative law as a sample. The law $1+1=1+1$ is evident. Assuming $1+n=n+1$, we have $1+n^+=(1+n)^+$ by definition, $(1+n)^+=(n+1)^+$ by assumption and $(n+1)^+=(n^+)^+=n^++1$ by definition. Hence the set of positive integers m for which $m+1=1+m$ is true includes 1, and includes n^+ if it includes n; hence, by postulate (iv), it includes every positive integer.

The other proofs make similar use of postulate (iv). Using it, we can further prove the cancellation laws

$$a+m=a+n \text{ implies } m=n, \tag{7}$$
$$a\times m=a\times n \text{ implies } m=n \qquad (a\neq 0). \tag{8}$$

The proof of the laws of cancellation in terms of the concepts of class and one-one correspondence alone, and without the use of finite induction, is difficult for reasons which will appear later in the discussion of transfinite cardinal numbers.

Order Properties.—We can easily define the relation $a\leqq b$ in terms of classes, to mean that there is a one-one correspondence between a class A containing a elements and a subset of a class B containing b elements. In this definition, we include B as a

subset of itself.

From this definition, it is easy to prove that one can add and multiply inequalities. Thus,

$$a \leqq b \text{ implies } a+c \leqq b+c, \tag{9}$$
$$a \leqq b \text{ implies } a \times c \leqq b \times c \quad (\text{if } c \geqq 0). \tag{10}$$

The restriction $c \geqq 0$ in (10), like the restriction $a \neq 0$ in (8), is added to provide for later generalizations; it is automatically fulfilled in the case of positive integers. Again, $a \leqq b$ and $b \leqq c$ imply $a \leqq c$. In addition,

$$\text{for any } a, b, \text{ either } a \leqq b \text{ or } b \leqq a\text{; if both hold, then } a = b. \tag{11}$$

However, the proof of this, like the proof of (7)–(8), is not easy without the use of finite induction; *i.e.*, no simple proof based on the concepts of class and correspondence is known.

Peano's definitions show that we can define addition and multiplication of positive integers in terms of the order relation. This is because m^+ is defined by the properties that $m^+ > m$, and that $n > m$ implies $n \geqq m^+$. It is curious that we can conversely define order in terms of the operation of addition. In fact,

$$a + x = b \text{ has a solution in positive integers if and only if } a < b. \tag{12}$$

Subtraction and Division.—We have not introduced subtraction and division as fundamental operations for the simple reason that they can be defined as the inverses of addition and multiplication, respectively. Thus, the difference $a-b$ of two numbers a and b is defined as a solution x of the equation

$$b + x = a \tag{13}$$

and the quotient $\frac{a}{b}$ of a by b as a solution y of the equation

$$b \times y = a. \tag{14}$$

If we restrict ourselves to positive integers, differences and quotients need not always exist (*cf.* $3+x=2$, $3 \times y = 2$, [12]), but if they do, laws (7)–(8) guarantee that they are unique.

Furthermore, the usual laws of operation, such as

$$\begin{aligned} &(a-b) = (c-d) \quad \text{means } a+d = b+c, \\ &(a-b) + (c-d) = (a+c) - (b+d), \\ &(a-b) \times (c-d) = (a \times c + b \times d) - (a \times d + b \times c), \end{aligned} \tag{15}$$

and (*see* FRACTION)

$$\begin{aligned} &\left(\frac{a}{b}\right) = \left(\frac{c}{d}\right) \quad \text{means } ad = bc, \\ &\left(\frac{a}{b}\right) + \left(\frac{c}{d}\right) = \frac{(a \times d + b \times c)}{bd}, \\ &\left(\frac{a}{b}\right) \times \left(\frac{c}{d}\right) = \frac{a \times c}{b \times d}, \end{aligned} \tag{16}$$

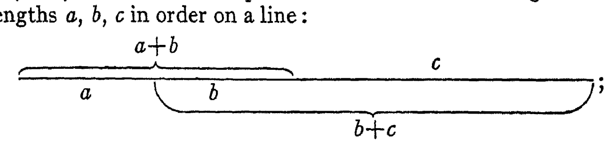
can be proved from laws (1)–(5). This is one reason why laws (1)–(5) are called the fundamental laws of arithmetic.

THE REAL NUMBER SYSTEM

Number as Quantity.—Mankind was early led to the concept of a real number by the need for symbols to represent such geometric quantities as lengths, areas and volumes and such physical quantities as weight and (more recently) electric charge.

The characteristic features of such quantities are that (1) two quantities of the same kind can be added by some obvious geometrical or physical operation (such as laying two segments next to each other on a straight line), and (2) any quantity can be divided into parts. The second feature, of infinite divisibility, is the crudest way of expressing the principle that the real-number system is continuous, and not discrete like the system of positive integers.

The commutative and associative laws (1)–(2) of addition are frequently intuitively obvious from the physical definition of addition. Thus, in the case of lengths, it is obvious that $a + (b+c) = (a+b) + c$ since both represent the sum of three segments of lengths a, b, c in order on a line:



It is also obvious that $a+b = b+a$ since the segment $a+b$ can be transformed into the segment $b+a$ by rotation through 180°.

In representing quantities by numbers, it is usually necessary to choose first an arbitrary unit, such as a foot, a square inch or a pound.

This unit of quantity is assigned arbitrarily the numerical value 1, and exact multiples of this quantity (*i.e.*, sums of an integral number of unit quantities) are assigned corresponding integral values. Since the entire addition table for positive integers can be constructed from the associative law for positive integers (2′), it is clear that the sum of two such quantities must be represented by the sum of the corresponding positive integers.

Multiplication; Number as Ratio.—A simple definition of the product of two quantities is not always possible. For example, if we define the product of two lengths a and b as the area of the rectangle with sides a and b, it may logically be objected that this is a quantity of a different kind.

In order to get around this logical difficulty, the Greeks suggested that a number a should be considered as representing the ratio between a certain quantity and the unit quantity, and never as representing the quantity itself. Thus, 160 lb. is a weight; the number 160 is the ratio of this weight to the weight of a pound.

This idea that numbers are dimensionless ratios has wide applicability. Thus, it leads to plausible "proofs" of the laws of multiplication. For example, the hypothesis that $a \times (b \times c) = (a \times b) \times c$ for all real numbers is given substantial support by the fact that both quantities may be regarded as representing the volume of a box of sides a, b, c. The laws $a \times b = b \times a$ and $a \times (b+c) = (a \times b) + (a \times c)$ can be given similar plausible geometric interpretations in terms of areas.

But these plausible arguments are not proofs in any rigorous sense. They depend not only on postulates for geometry, but also on definitions of area and volume.

The only known way of getting rid of these embarrassing difficulties is to define real numbers abstractly in terms of the system of positive integers, deducing all properties of real numbers by pure logic from these definitions and properties of the positive integers, and using geometrical and physical concepts only to suggest possible postulates and definitions. In this way the properties of real numbers may be made to depend on pure logic and the concept of a class alone (*see* MATHEMATICS, FOUNDATIONS OF).

We shall follow this abstract procedure henceforth.

Rational Numbers.—If we assume that division (except by zero) and subtraction are always possible, we are led inevitably from the system of positive integers to the system of rational numbers (*i.e.*, of positive and negative fractions and integers, and zero).

Thus, let us assume that every equation $by = a$ with positive integral coefficients a, b has a solution y. This corresponds to the idea that a quantity a can be divided into any positive number b of equal parts. Let us try also to preserve the five fundamental laws (1)–(5) of arithmetic and the cancellation law (8).

By (8), $by = a$ can have only one solution, which we write $\frac{a}{b}$. It may be shown that the usual rules (16) for adding and multiplying fractions must hold. For example, if $by = a$ and $dz = c$, then $bdy = ad$, $bdz = bc$; and so $bd(y+z) = bdy + bdz = ad + bc$, which proves that $\frac{a}{b} + \frac{c}{d} = \frac{(ad+bc)}{bd}$. We can also prove

$$\frac{\left(\frac{a}{b}\right)}{\left(\frac{c}{d}\right)} = \frac{ad}{bc}, \tag{17}$$

whence division by fractions as well as by integers is positive in our new system.

Conversely, we can prove that the rules (16) do give a system in which laws (1)–(12) are valid (we let $\frac{a}{b} > \frac{c}{d}$ mean that $ad > bc$ for positive fractions); in most cases, the proof may be reduced

to the corresponding law for the positive integers by substitution in (16) and cancellation.

Similarly, suppose we assume that every equation $\frac{c}{d}+y=\frac{a}{b}$ has a solution. This hypothesis is suggested by the properties of positive and negative electric charges in physics, by the fact that distance on a straight line can be measured in two directions (right = positive and left = negative), etc.

However, it is not necessary to denote the solution of $\frac{c}{d}+y=\frac{a}{b}$ by such a complicated symbol as $\frac{a}{b}-\frac{c}{d}$. In fact, by (11), either $\frac{a}{b}=\frac{c}{d}$, $\frac{a}{b}>\frac{c}{d}$ or $\frac{a}{b}<\frac{c}{d}$. Hence, by (12), which amounts to saying that $\frac{a}{b}+\frac{x}{y}=\frac{c}{d}$ has a solution if and only if $\frac{a}{b}<\frac{c}{d}$, either $\frac{a}{b}=\frac{c}{d}$ or $\frac{c}{d}+y=\frac{a}{b}$ has a positive solution $\frac{f}{e}$, or $\frac{b}{a}+z=\frac{c}{d}$ has a positive solution $\frac{h}{g}$. Corresponding to these three cases, we write $\frac{a}{b}-\frac{c}{d}=0$, $\frac{a}{b}-\frac{c}{d}=\frac{f}{e}$ and $\frac{a}{b}-\frac{c}{d}=-\left(\frac{h}{g}\right)$.

Moreover, instead of proving (15), we can derive the rules for operating with negative fractions and zero from

$$0+a=a, \qquad a\times 0=0, \tag{18}$$

and the mysterious law

$$(-1)\times(-1)=1. \tag{19}$$

These in turn are necessary consequences of our laws (1)–(8). Thus, if we define 0 as $1-1$, by adding $a-1$ to both sides of $0+1=1$, we get $0+a=a$. Multiplying through $0+1=1$ by a, we get $a\times 0+a=a=0+a$, whence (cancelling) $a\times 0=0$. Finally, multiplying the equation $1+(-1)=0$, which defines (-1), through by -1, we get $(-1)+(-1)\times(-1)=0$ by (5), (6) and (18). Adding 1 to both sides, we get (19) after reduction.

A more thorough study would reveal that a considerable reduction in the number of postulates (fundamental laws needed to imply the others) is possible. Thus, all the laws for the positive fractions can be deduced from the associative law for addition, the distributive laws $a\times(b+c)=(a\times b)+(a\times c)$ and $(a+b)\times c=(a\times c)+(b\times c)$, the unit laws $a\times 1=1\times a=a$, and $1+1\neq 1$.

Irrational Numbers.—Fractions were employed as early as 1700 B.C. by the ancient Egyptians, and it was not until Pythagoras (525 B.C.) that the need for other numbers was discovered. The need for such irrational numbers is amply corroborated in modern mathematical analysis, where they play a fundamental role in the integral calculus, trigonometry, etc. Pythagoras showed that the ratio x of the diagonal of an isosceles right triangle to the length of a side must satisfy the equation $x^2=2$ (Pythagorean theorem). However, no fraction $\frac{m}{n}$ can satisfy $\left(\frac{m}{n}\right)^2=2$; that is, $m^2=2n^2$ has no solution in integers. For 2 divides m^2, an even, and it divides $2n^2$, an odd, number of times.

Eudoxus pointed out (375 B.C.) that although $\sqrt{2}$ could not be represented exactly by any one fraction, it could be represented as a limit of a sequence of fractions (*see* NUMBER SEQUENCES). Thus, we can represent $\sqrt{2}$ in the form of an infinite decimal: $2=1.4142\cdots$; this amounts to specifying $\sqrt{2}$ as the limit of the sequence of decimal fractions

$$1, \frac{14}{10}, \frac{141}{100}, \frac{1414}{1000}, \frac{14142}{10000}, \cdots.$$

These ideas are discussed from the Greek point of view in the tenth book of Euclid's *Elements* (300[?]B.C.).

Their clear exposition from the modern point of view is due to G. Cantor (1871). Real numbers, including both rational and irrational numbers, are defined by Cantor as infinite sequences $x=(x_1, x_2, x_3, \cdots)$, $y=(y_1, y_2, y_3, \cdots)$, $\cdots$, of fractions $x_n, y_n, \cdots$, which converge in the sense that (x_m-x_n), (y_m-y_n), $\cdots$, approach zero as m, n increase indefinitely. We regard x as the limit of the sequence $(x_1, x_2, x_3, \cdots)$.

Equality is defined by making $x=y$ mean that x_n-y_n approaches zero as n increases indefinitely. Addition and multiplication are defined by

$$x+y=(x_1+y_1,\ x_2+y_2,\ x_3+y_3,\ \cdots),$$
$$x\times y=(x_1\times y_1,\ x_2\times y_2,\ x_3\times y_3,\ \cdots). \tag{20}$$

Laws such as (1)–(17), valid for rational numbers, are extended to all real numbers by the principle of continuity. For example, each approximating term $(x+y)_n=x_n+y_n$ of $x+y$ is equal to the corresponding approximation $(y+x)_n=y_n+x_n$ of $y+x$; hence, $(x+y)_n-(y+x)_n=0$ for all n, and $x+y=y+x$ by definition of equality. In general, the principle of continuity states that laws involving continuously varying functions like $x+y$ and $x\times y$, which are valid for arbitrarily good approximations $x_n, y_n, \cdots$ of $x, y, \cdots$ must be also valid for the limit values $x, y, \cdots$.

Another interesting definition of real numbers is due to R. Dedekind (1872). By a section in the class R of fractions, we mean a division of all fractions into two classes L and U, such that $x\leqq y$ for every x in L and y in U. Each fraction (rational number) r determines a section: L consists of the $x\leqq a$ and U of the $y\geqq a$. The other sections define the irrational numbers; thus, the section dividing the fractions into the $x<\sqrt{2}$ and the $y>\sqrt{2}$ more precisely, the positive y with $y^2>2$) may be regarded as defining $\sqrt{2}$. Dedekind's definition can be proved to be equivalent to Cantor's.

The real numbers defined by this process have so far been found adequate for the mathematical treatment of quantities such as length, area, weight, electric charge, etc. Not only are the fundamental laws (1)–(6) of arithmetic, the cancellation laws (7)–(8) and the order properties (9)–(11) true, but division (except by zero) and subtraction are always possible. Finally, we have the property that any increasing sequence $x_1<x_2<x_3\cdots$ whose terms are all bounded above by a fixed constant c must tend to a limit.

We shall now discuss other types of numbers; in every case, we shall have to lose some of the properties of real numbers.

GENERALIZATIONS

Complex Number System.—It is clear that the equation $x^2=-1$ can have no real solution since the square of any real quantity is positive or zero. But we can introduce $i=\sqrt{-1}$ as an imaginary number and preserve those laws (1)–(8) and (15)–(19) of addition and multiplication which do not involve the relation $a\geqq b$. To do this, we must clearly introduce all combinations $a+bi=a+b\times\sqrt{-1}$; these are the so-called complex numbers. Moreover, we must put

$$(a+bi)+(c+di)=a+c+bi+di=(a+c)+(b+d)i,$$
$$(a+bi)\times(c+di)=ac+(ad+bc)i+bdi^2=(ac-bd)+(ad+bc)i.$$

If we define addition and multiplication of complex numbers by these formulas, laws (1)–(8) and (15)–(19) will be satisfied. For example, it can be verified by substitution that the equation $(c+di)z=(a+bi)$ has the solution

$$z=\frac{(a+bi)}{(c+di)}=\frac{a}{(c^2+d^2)}+\left[\frac{b}{(c^2+d^2)}\right]i.$$

Furthermore, any quadratic equation $Ax^2+Bx+C=0$ with real coefficients has complex roots

$$\frac{(-B\pm\sqrt{B^2-4AC})}{2A},$$

since even if $B^2-4AC=-D$ is negative, the numbers $\frac{(-B\pm\sqrt{D}i)}{2A}$ can be found as complex numbers.

This is a special case of the fundamental theorem of algebra, which asserts that any polynomial equation $x^n+a_1x^{n-1}+\cdots+a_n=0$ with real or complex coefficients has a complex root (*see* COMPLEX NUMBERS; EQUATIONS, THEORY OF). Thus from a strictly algebraic standpoint, no further generalization is called for.

Although the theory of algebraic equations is greatly simplified by the use of complex numbers, it is necessary to sacrifice the properties of order. If, as by (11), either $a\geqq 0$ or $a\leqq 0$, then

by (9) either $a \geqq 0$ or $-a = -a+0 \geqq -a+a=0$; in either case, by (10), $a^2=(-a)^2 \geqq 0$. That is, there is no way in which we could define order so as to satisfy (9)–(11), and make negative numbers have square roots.

Complex numbers are not only useful in pure mathematics (theory of equations and function theory), they are universally used in discussing electric circuits and simplify the solution of many problems in mechanics.

Quaternions and Hypercomplex Numbers.—If we are willing to sacrifice the properties of order, and the commutative law of multiplication as well, we can obtain an interesting further extension of the complex-number system, the so-called quaternions(*q.v.*).

Quaternions are numbers of the form $a+bi+cj+dk$, where a, b, c, d are real.

The sum $(a+bi+cj+dk)+(a'+b'i+c'j+d'k)$ is defined as $(a+a')+(b+b')i+(c+c')j+(d+d')k$. Multiplication is defined from the equations (generalizing $i^2=-1$), $i^2=j^2=k^2=-1$, $ij=jk=ki=-ji=-kj=-ik=-1$.
Laws (1), (2), (4)–(8) are satisfied, and subtraction and division (except by zero) are possible. Further, any polynomial equation with quaternion coefficients has a quaternion root.

For many years quaternions were widely used in solving physical problems, but since about 1900 their use in physics has been replaced by that of the vector calculus.

The construction of quaternions can be further generalized. For any set of n^3 real coefficients C_k^{ij}, we can define a linear algebra, or system H of hypercomplex numbers, as follows. The elements of H are the expressions $a_1\epsilon_1+\cdots+a_n\epsilon_n$, where the "units" $\epsilon_1, \cdots, \epsilon_n$ take the place of the special quaternions l, i, j, k, and are the same for all elements; $a_1, \cdots, a_n$ are arbitrary real numbers. The sum of $a_1\epsilon_1+\cdots+a_n\epsilon_n$ and $b_1\epsilon_1+\cdots+b_n\epsilon_n$ is defined as $(a_1+b_1)\epsilon_1+\cdots+(a_n+b_n)\epsilon_n$. Their product is defined as the sum $a_1b_1\epsilon_1^2+a_1b_2\epsilon_1\epsilon_2+\cdots+a_nb_n\epsilon_n^2$, where the $\epsilon_i\epsilon_j$ are given by $\epsilon_i\epsilon_j=C_1^{ij}\epsilon_1+C_2^{ij}\epsilon_2+\cdots+C_n^{ij}\epsilon_n$.

Although the study of hypercomplex numbers forms an interesting branch of algebra (*see* LINEAR ALGEBRAS), the complex numbers and quaternions are the only systems of hypercomplex numbers with real coefficients in which multiplication is associative and division is possible.

Algebraic and Transcendental Numbers.—Numbers which, like $\sqrt[3]{5}$ and $\sqrt{-1}$, represent roots of polynomial equations $a_0x^n+a_1x^{n-1}+\cdots+a_n=0$ with integral coefficients are called algebraic numbers. It can be shown that any sum, difference, product or quotient of algebraic numbers is again algebraic, and that so is any root of a polynomial equation whose coefficients a_i are all algebraic numbers. For this reason, algebraic numbers form a closed subsystem of the system of complex numbers, which can be studied without using limits or other infinite processes. Algebraic numbers have many fascinating properties (*see* NUMBERS, THEORY OF).

Real or complex numbers which are not algebraic are called transcendental. In 1851 Joseph Liouville first proved the existence of transcendental numbers; in 1873 Charles Hermite proved that the base e of natural logarithms was transcendental and in 1882 Ferdinand Lindemann proved that π was transcendental. We now know that the vast majority of real numbers are transcendental (see *Infinite Cardinal Numbers*, below).

Modular Numbers: Fields.—Another interesting class of modular-number systems, each containing a finite number of elements, can easily be constructed from the positive integers. For each prime number $p=2, 3, 5, 7, \cdots$, consider the integers $0, 1, 2, \cdots, p-1$. The sum $a+b$ and product $a\times b$ of any two of these integers are defined as the remainders of the ordinary sum $a+b$ and product $a\times b$, when divided by p. Thus, if $p=3$, then $2+1=0$ and $2\times 2=1=4-3$; the complete addition and multiplication tables are

+	0	1	2
0	0	1	2
1	1	2	0
2	2	0	1

×	0	1	2
0	0	0	0
1	0	1	2
2	0	2	1

These number systems satisfy conditions (1)–(6), and subtraction and division (except by zero) in them is always possible. They were first studied by K. F. Gauss (*Disquisitiones Arithmeticae* [1801]).

Number systems satisfying laws (1)–(6), in which subtraction and division (except by zero) are always possible, are called fields. All the fields having a finite number of elements are known—they are called Galois fields; for each prime power p^n, there is exactly one having p^n elements. An interesting theorem, proved by J. H. M. Wedderburn in 1910, asserts that for systems containing only a finite number of elements, the commutative law of multiplication is a consequence of the other laws (*see* FIELDS). Hypercomplex number systems with coefficients in a modular field or any other field can be constructed just as easily as if the coefficients were in the field of real numbers.

Infinite Cardinal Numbers.—In the definition of a cardinal number given at the beginning of this article, there is nothing stated which requires the class to be finite. Thus, it is perfectly legitimate to ascribe the mark d (denumerable infinity) to the class J of all positive integers and every other class which can be put in one-one correspondence with J. Similarly, it is perfectly legitimate to ascribe the mark c (power of the continuum) to the class $R\#$ of all real numbers and every other class which can be put in one-one correspondence with $R\#$.

The definitions of addition and multiplication are still valid, as are the proofs of the basic laws (1)–(6) of arithmetic. The definition of the relation $a \leqq b$ is also valid, and laws (9)–(11) can be proved for infinite numbers as well as for finite numbers; only (11) offers any difficulty.

In fact, we can even define exponentiation for infinite as well as finite cardinal numbers. But we must avoid the usual elementary definition $a^n=a\times\cdots\times a$ (n factors) and define a^s as the cardinal number of the class of all single-valued functions (*see* CALCULUS, DIFFERENTIAL AND INTEGRAL) or rules f assigning to each element x in a class of b elements a single value $y=f(x)$ in a class of a elements. One can then prove easily the usual laws of exponents

$$(a\times b)^s=a^s\times b^s,\quad a^{s+t}=a^s\times a^t,\ (a^s)^t=a^{s\times t}. \qquad (21)$$

One can also connect the infinite cardinal numbers c and d by the interesting formula

$$c=2^d. \qquad (22)$$

The main loss in dealing with infinite cardinal numbers is that the laws (7)–(8) of cancellation are no longer valid. In fact, for every infinite cardinal number γ, it can be proved that

$$\gamma=\gamma+1,\ \gamma+\gamma=\gamma,\ \gamma\times\gamma=\gamma. \qquad (23)$$

These equations imply that every infinite class can be placed in one-one correspondence with a proper subclass of itself. For example, there is an obvious one-one correspondence between the class J of positive integers $1, 2, 3, \cdots$, and the class E of even integers $2, 4, 6, \cdots$; another between J and the class O of odd integers $1, 3, 5, \cdots$; it follows from the definition of addition that $d+d=d$.

From $\gamma=\gamma+1$ we easily get $\gamma+1=\gamma+2$, while $\gamma+\gamma=\gamma$ implies $2\times\gamma=1\times\gamma$; hence, neither law of cancellation holds. For this reason it is impossible to extend the system of finite and infinite cardinal numbers to larger systems in which subtraction or division are possible.

From $\gamma+\gamma=\gamma$ it can easily be shown that the class of all integers $\pm n$, 0 has the same cardinal number d as the class of positive integers; from $\gamma\times\gamma=\gamma$, it follows that the class of all rational numbers $\pm\frac{m}{n}$ also has the cardinal number d; this is even true of the class of all algebraic numbers.

This suggests the conjecture that perhaps the class $R\#$ of all real numbers also has the cardinal number d. We shall now disprove this. It would mean that all real numbers could be written in a sequence, S, just as the integers $1, 2, 3, \cdots$, can be so written. First let us imagine the numbers of this sequence to be written in decimal form. Now certain rational numbers admit of double representation, as is evident from the fact that 0.879999

$\cdots=0.880000\cdots$. Let us agree, in all such cases, to use the mode of representations by 9s, so that every number shall have a unique decimal representation. We may now construct another number $0\cdot x_1x_2x_3\cdots$ as follows. Let the first digit x_1 after the decimal point be chosen apart from 0 and the first digit (after the decimal point) of the first number of S, let x_2 be chosen apart from 0 and the second digit of the second number of S; and so on. There will then be defined a number in decimal form which is obviously distinct from all the numbers of S, which disproves our conjecture.

This disproof by the diagonal process of G. Cantor can be generalized so as to apply to any cardinal number. Thus, there is an infinite sequence of distinct infinite cardinal numbers: $d<2^d=c<2^c<2^{2^c}<\cdots$. It is not known whether or not there are others in between the ones listed.

Since the cardinal number of the class of algebraic numbers is d, the preceding argument proves that there exist real transcendental numbers and, in fact, that there are infinitely more transcendental numbers than algebraic numbers.

Infinite Ordinal Numbers.—Consider the infinite sequence of non-negative integers $0, 1, 2, 3, \cdots$. It has the property that every nonempty subset has a first member (so-called well-ordering property). It was observed by Cantor that one can extend this sequence in exactly one way without losing the well-ordering property. Indeed, there must be a first infinite ordinal ω after all the integers, a first ordinal $\omega+1$ after ω, a first ordinal $\omega+2$ after $\omega+1$ and so on. Immediately after the sequence $\omega, \omega+1, \omega+2, \cdots$, there must be a first ordinal 2ω, followed by $2\omega+1$, $2\omega+2$, $\cdots$; then 3ω, $3\omega+1$, $\cdots$. Evidently this process of ordinal numeration can be continued, giving numbers of the form (*see* NUMBER SEQUENCES)

$$\begin{array}{l} 0,\ 1,\ 2,\ \cdots \\ \omega,\ \omega+1,\ \omega+2,\ \cdots \\ 2\omega,\ 2\omega+1,\ 2\omega+2 \\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot \\ \omega^2,\ \omega^2+1,\ \omega^2+2,\ \cdots \\ \omega^2+\omega,\ \omega^2+\omega+1,\ \omega^2+\omega+2,\ \cdots \\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot\ \cdot \end{array}$$

We can identify each ordinal number α in this sequence with the set of κ preceding α, in order. Thus, 3 corresponds to the ordered set $(0, 1, 2)$, ω with the ordered sequence of all non-negative integers and so on.

If we do this, we can define $\alpha+\beta$ as the result of laying the sequence β after the sequence α, $\alpha\beta$ as the result of substituting the sequence β for each term of the sequence α and α^2 as $\alpha\alpha$ These definitions are consistent with the notations we have introduced; however, $1+\omega=\omega\neq\omega+1$ and $\omega 2=\omega\neq 2\omega$, so that neither addition nor multiplication is commutative. On the other hand, both operations are associative, $(\alpha+\beta)\gamma=\alpha\gamma+\beta\gamma$, and we rescue the one-sided cancellation laws, $\alpha+\beta=\alpha+\gamma$ implies $\beta=\gamma$, $\beta\alpha=\gamma\alpha$ implies $\beta=\gamma$.

There seems to be no reason why the process of ordinal enumeration of the elements of a class C cannot be continued indefinitely until all the elements of the class have been counted. That is, it is plausible to assume that every class can be well ordered. Using this assumption, one can prove that $\alpha+\alpha=\alpha$ and $\alpha^2=\alpha$ for all infinite cardinal numbers. However, inasmuch as no infinite class not equivalent to (*i.e.*, in one-one correspondence with) the class of integers has ever been constructively well ordered, this assumption must still be accepted with reservations (*see* MATHEMATICS, FOUNDATIONS OF).

Ordered Fields.—In each of the preceding generalizations of the real-number system, we have lost either the order properties (9)–(11), as in the cases of complex, quaternion and modular numbers, or the possibility of subtraction and division, as in the cases of infinite cardinal and ordinal numbers. We shall now show that there exist ordered fields, not contained in the real-number system which have both the order properties and the arithmetic properties of the rational and real numbers.

Consider the class of infinite formal power series

$$a(x)=a_{-m}x^{-m}+a_{-m+1}x^{-m+1}+\cdots+a_0+a_1x+a_2x^2+\cdots, \qquad (24)$$

which begin with an arbitrary positive or negative integral power $a_{-m}x^{-m}$ of the symbol x with real nonzero coefficient a_{-m}. To add two such series, add corresponding coefficients; thus, $c(x)=a(x)+b(x)$ means $c_n=a_n+b_n$ for all n. To multiply, let the coefficient c_n of x^n in the product $c(x)=a(x)b(x)$ be the sum of all products a_ib_j such that $i+j=n$; thus $(x+x^2-x^3+\cdots)(2x^{-2}+3x^{-1}-4+\cdots)=(2x^{-1}+5-3x+\cdots)$. Define $a(x)\geqq 0$ to mean that $a_{-m}\geqq 0$ in (24). Finally, add 0 to the system, using (18) to define addition and multiplication by zero.

With these definitions, the fundamental laws (1)–(6) can easily be proved. It is also easy to show that subtraction is always possible. Further, division (except by zero) is always possible; thus, $\frac{1}{(1-x)}=1+x+x^2+\cdots$ as in the familiar high-school formula. Hence, the formal power series (24) and 0 form a *field* (*see* above). Finally, if we define $a(x)\geqq b(x)$ to mean $a(x)-b(x)\geqq 0$, the order properties (9)–(11) hold.

In fact, the only property of real numbers which is not shared by our new system is the completeness property, that any increasing sequence of real numbers, whose terms are all bounded above by a fixed quantity, must tend to a limit. In fact, the increasing sequence $-1<-\frac{1}{2}<-\frac{1}{4}<\cdots$, whose terms are all bounded above by 0, does not tend to a limit in our new system. For example, it does not approach 0, since $-x$ separates 0 from every term of the sequence. Since it can be proved that any ordered field with the completeness property is equivalent to the real-number system, we cannot hope to obtain any closer analogue of the real-number system.

NUMBERS is the fourth book of the Pentateuch, as the five books of the Law, or of Moses, have come to be called. The three previous books carried on the story of Israel's history from the creation, through the captivity in Egypt and the escape therefrom, down to the sojourn at Sinai. Numbers traces out the march from Sinai, the wanderings in the wilderness and the final arrival on the steppes of Moab within sight of the Promised Land. Like the other books of the Pentateuch, it consists of earlier (JE) and later (P) sources; *see* BIBLE: *Old Testament*. But, although the sources come from different ages and from writers of different schools of thought, yet if its significance is properly to be apprehended, it is necessary to remember that for more than 2,000 years it has been a complete whole.

The book falls naturally into three sections which follow a chronological sequence: (1) chaps. i–x, 10 (P), Israel's sojourn at Sinai, the census and the promulgation of various laws by Moses; (2) chaps. x, 11–xxii, 1 (JE and P), incidents which occurred during the wanderings between Sinai and the arrival at the steppes of Moab; these incidents seem to have been chosen mainly for the purpose of casting light on the religious history and character of the people and also to explain the meaning of various place names (*cf.* Taberah and Kibroth hattaavah, xi, 3, 34); they also attempt to give an account of the origin of some religious objects of worship (*e.g.*, the brazen serpent, xxi, 4–11); (3) chaps. xxii, 2–xxxvi (mainly P), the sojourn on the steppes of Moab, the incident of Balaam, the second census and the giving of additional laws, together with various other incidents.

The middle section contains important passages from J and E: the 12 spies, the rebellion of Korah and Balaam's mission to Balak (no signs of P). J, E and P can be readily separated in chaps. xi and xii. To E belongs the passage describing the outpouring of the Spirit on Eldad and Medad and the remarkable prayer of Moses in xi, 29, "Would God that all Yahweh's people were prophets that Yahweh would put his Spirit upon them," *cf.* the idea that Christians are "priests unto God" (Rev. i, 6). As usual, the J and E elements possess such a vivid character as to render them familiar to ordinary readers; contrast P's legisla-

tive and statistical style, and his diffuseness (which reaches a climax in chap. vii). The most illuminating example of the difference between JE and P is found in the passage that occurs after the first long section of P describing the order of march of the several tribes and the position of the ark in the very centre of the host, both when encamped and on the march. In x, 30, Moses entreats Hobab, the son of Reuel, his father-in-law, to come with the Israelites to be "eyes" unto them; and in x, 33, it is stated that the ark went before them to seek out a resting place for them. It is clear that these statements directly contradict P's elaborate scheme, according to which the people march mechanically, tribe by tribe, with the ark in the very centre of the square, and guided by the pillar of cloud by day and the pillar of fire by night. Moses, instead of simply following the pillar of cloud, requests Hobab to determine the line of march and select the sites for encampment. No clearer proof could be desired of the nature of early methods of compilation than that the detailed account in chaps. i–x, 28, should be immediately followed by two short paragraphs in palpable contradiction of the whole plan of camp and march so elaborately worked out in the preceding narrative.

Of very great interest is the account of Korah's revolt in chap xvi, which is composed of J, E and P in a most intricate manner Literary analysis has unravelled three stages of development: (1) two *Reubenites,* Dothan and Abiram, rebel against the *civil* authority of Moses; (2) Korah the Levite, with 250 *Israelites,* rebels against the *religious* authority of Moses and Aaron; and (3) Korah at the head of 250 *Levites* protests against the priestly privileges of Aaron (for details *see* the commentaries). The analysis (which is generally accepted) is of extreme value for the difficult study of the history of the Levites (*q.v.*).

Another very important narrative is that of Balaam (*q.v.*). It includes a number of poetical quotations which help to determine its date and also indicate the value of poetry in its bearing on history. Also in xxi, 14, we have a poetical quotation from a lost volume of early poetry entitled "The Book of the Wars of Yahweh." Deborah's song was probably originally in this book; and when we compare its statement as to Israel's full fighting strength, viz., 40,000 men, with the statements in the prose of Numbers as to 600,000 men and more, we at once realize how much closer to actual facts we are brought by early poetry than by the later prose of writers like P. Perhaps it is in chap. xxxi that we have the clearest proof of P's nonhistorical character. There we are told that 12,000 Israelites, without losing a single man, slew every male Midianite, children included, and every Midianite woman that had known a man, and took so much booty that there had to be special legislation as to how it should be divided. But if this were actual fact, how could the Midianites have ever reappeared in history? And yet in Gideon's time they were strong enough to oppress Israel.

NUMBERS, THEORY OF.—The theory of numbers is concerned, in its elementary parts, with properties of the integers, or whole numbers, $0, \pm 1, \pm 2, \cdots$. Examples of such properties which emerged in ancient times are these: the Chinese knew in 500 B.C. that 2^p-2 is divisible by p, for prime numbers p; Euclid (300 B.C.) proved that there exist infinitely many primes (otherwise, if p could be the greatest prime, then as a contradiction a larger prime would divide $M+1$, where M denotes the product $2\cdot 3\cdot 5\cdots p$ of all primes up to p). While most results of this vast and beautiful subject, dealing with the universally familiar whole numbers, are easy to understand, the proofs of many use the deepest resources of mathematics, and some of the most interesting conjectures are still unproved.

DIVISIBILITY AND PRIMALITY

Elementary Definitions, Factorization Into Primes.—If a and b are integers, and $a=bc$ for some integer c, then b is called a *factor* or *divisor* of a; abbreviated $b|a$, read "b divides a"; thus $1|a$ and $a|a$ for every integer a. A *prime* number is an integer $p(>1)$ such that p has no positive factors except 1 and p; examples are 2, 3, 5, 7, 11. Other integers greater than 1 are called *composite.*

Every integer greater than 1 is either itself a prime or can be expressed as a product of primes in only one way (except for rearrangement of factors). This fact, known as the "fundamental theorem of arithmetic," is usually proved by means of a property given by Euclid, namely, if a prime p divides ab, then p divides a or b. To establish this property Euclid showed that if d is the greatest common divisor (g.c.d.) of a and b, then there exist integers x and y satisfying $ax+by=d$ (*cf.* end of section 2). Assuming this, suppose that $p|ab$ but not a; then since p is a prime, the g.c.d. of p and a is 1, $ax+py=1$, $abx+pby=b$, hence $p|b$.

The symbol (a,b) is frequently used for the g.c.d. of the integers a and b, assumed not both zero. If $(a,b)=1$, a and b are called *relatively prime,* or *coprime,* and a is described as *prime to b.*

Several independent proofs of the fundamental theorem of arithmetic, based on mathematical induction, have appeared (H. Hasse, 1928; E. Zermelo, 1934; Ferdinand Lindemann, 1933). *See* Arithmetic: *Theory of Divisors.*

2. Residue Classes: Euler's Theorem.—Let m denote a given positive integer. Every integer a can be expressed in the form $a=qm+r$, where q is an integer (the *quotient* on division by m) and r, the *remainder,* has one of the m values $0, 1, \cdots, m-1$. Two integers a and b having the same remainder r are said to be *congruent modulo m,* abbreviated $a\equiv b \bmod m$. Clearly this is equivalent to saying that $m|a-b$. All integers congruent modulo m to a given integer are considered as forming a *residue class* modulo m. There are m residue classes.

If $a\equiv b \bmod m$, $(a,m)=(b,m)$. If $(a,m)=1$ we may therefore say that the residue class of a modulo m is prime to m. Those residue classes which are prime to m are said to form a *reduced system* of residue classes mod m. For example, if $m=12$, the reduced system is represented by the four residues 1, 5, 7 and 11.

L. Euler introduced the symbol $\phi(m)$ to denote the number of reduced residue classes mod m, or what is equivalent, the number of positive integers prime to m and not exceeding m. For example, $\phi(1)=1$, $\phi(p)=p-1$ for any prime p. One easily proves that $\phi(mn)=\phi(m)\cdot\phi(n)$ if $(m,n)=1$, and $\phi(p^r)=p^r\left(1-\frac{1}{p}\right)$ for any prime p and positive integer r. This facilitates the evaluation of $\phi(m)$; *e.g.,* $\phi(12)=\phi(2^2)\cdot\phi(3)=2\cdot 2=4$, as noted earlier.

Let a be prime to m. If r_1-r_2 is not divisible by m, the same is true of ar_1-ar_2. It follows that if $r_1, r_2, \cdots, r_h$ (where $h=\phi(m)$) constitute a reduced residue system mod m, then $ar_1, ar_2, \cdots, ar_h$ comprise the same residues in a different order. Hence the difference of the products $ar_1.ar_2\ldots ar_h$ and $r_1r_2\ldots r_h$, which can be written $r_1r_2\ldots r_h(a^h-1)$, is divisible by m. Since $r_1r_2\ldots r_h$ is prime to m, m divides a^h-1.

This result, that $m|a^{\phi(m)}-1$ if a, m are coprime, is known as Euler's theorem (1760). Fermat's theorem (1640) is the special case for a prime p, $a^{p-1}\equiv 1 \bmod p$ if $(a,p)=1$.

By the same argument, the m residues ax $(x=0, 1, \cdots, m-1)$ are incongruent mod m, if $(a,m)=1$; hence the congruence $ax\equiv k \bmod m$ is solvable, for any k. Hence, if $(a,b)=1$, then for any given integer k there exist integers x, y satisfying $ax+by=k$.

2a. Primitive Roots.—It can be shown that if $(a,m)=1$, the least positive e such that $a^e\equiv 1 \bmod m$ must divide $\phi(m)$. If $e=\phi(m)$, a is called a *primitive root of m*; and the powers $1, a, a^2, \cdots, a^{e-1}$ comprise a reduced set of residues mod m. Primitive roots have importance in various applications involving nth powers; *e.g.,* in solving binomial congruences such as $x^n\equiv k \bmod m$. K. F. Gauss proved that primitive roots exist only when $m=2, 4, p^k$, or $2p^k$, where p is an odd prime.

3. Congruences in One Unknown.—If $a\equiv b \bmod m$ and $c\equiv d \bmod m$, it is easily seen that $a+c\equiv b+d$, $a-c\equiv b-d$, and $ac\equiv bd \bmod m$. Hence, if $f(x)$ is a sum of terms $a_0+a_1x+\cdots+a_nx^n$ with integral coefficients, then $f(a)\equiv f(b) \bmod m$, if $a\equiv b \bmod m$. Hence, in searching for solutions (called *roots*) of the congruence $f(x)\equiv 0 \bmod m$, one can confine oneself to incongruent solutions mod m. The *number of roots* is the number of

incongruent solutions mod m: *e.g.*, $x^3 \equiv 1$ mod 7 has precisely three roots, *viz.* $x \equiv 1, 2, 4$.

Let $m_1, m_2, \cdots, m_k$ be k positive integers, coprime in pairs, $m = m_1 \cdots m_k$. A method of solving the k congruences $x \equiv r_1$ mod $m_1, \cdots, x \equiv r_k$ mod m_k, for an integer x, uniquely determined mod m, was known to the Chinese in the first century A.D., and is called the "Chinese remainder theorem." This leads to the result that the number of solutions of $f(x) \equiv 0$ mod m is the product of the numbers of solutions of $f(x) \equiv 0$ mod m_i ($i = 1, \cdots, k$). The search for roots of $f(x) \equiv 0$ mod m can thus always be reduced to the case where m is a power of a prime. In certain cases there is a systematic way of deriving the solutions mod p^{r+1} from those mod p^r.

In the special case $m = p$ there holds an important theorem formulated by J. L. Lagrange (1768). If $(p, a_n) = 1$, the congruence $f(x) \equiv 0$ mod p is said to be of degree n. Lagrange proved that the number of roots of $f(x) \equiv 0$ mod p does not exceed the degree n.

As an application, consider $f(x) = x(x-1)(x-2)\cdots(x-p+1) - (x^p - x)$. This is a polynomial of degree $p-1$ at most, and $f(x) \equiv 0$ mod p for each of $x = 0, 1, \cdots, p-1$ (by Fermat's theorem). This contradicts Lagrange's theorem unless every coefficient is divisible by p. Hence, the sum of the products n at a time of $1, 2, \cdots, p-1$ is divisible by p if $n \leqq p-2$; while (by the coefficient of x),

$$1 \cdot 2 \cdot 3 \cdots (p-1) \equiv -1 \pmod p,$$

a result known as Wilson's theorem.

Since $x^{p-1} - 1 = (x^{\frac{1}{2}(p-1)} - 1)(x^{\frac{1}{2}(p-1)} + 1)$, it follows from Fermat's and Lagrange's theorems that each of the congruences $x^{\frac{1}{2}(p-1)} \equiv 1$ and $x^{\frac{1}{2}(p-1)} \equiv -1 \pmod p$ is satisfied by exactly $\frac{1}{2}(p-1)$ residues x mod p. Anticipating section 4, note that if a is any of the $\frac{1}{2}(p-1)$ quadratic residues of p, then $a \equiv x^2$, $a^{\frac{1}{2}(p-1)} \equiv x^{p-1} \equiv 1$. Accordingly, a is a quadratic residue or nonresidue of p according as $a^{\frac{1}{2}(p-1)} \equiv 1$ or $-1 \pmod p$. Putting $a = -1$ we obtain (*cf.* section 4) that the congruence $x^2 \equiv -1 \pmod p$ is solvable if $p \equiv 1$, but unsolvable if $p \equiv 3 \pmod 4$.

On pairing factors equidistant from the two ends, Wilson's theorem gives $(1.2.3\ldots\frac{1}{2}(p-1))^2 \equiv (-1)^{\frac{1}{2}(p+1)}$ mod p. Hence if p is a prime of the form $4n+3$, $1\ 2.3\ldots\frac{1}{2}(p-1) \equiv \pm 1$ mod p. The sign $+$ or $-$ in the last case was investigated by Dirichlet and others. Since -1 is a quadratic nonresidue of p, and since the product of an even (odd) number of quadratic nonresidues is a quadratic residue (nonresidue), the sign is $(-1)^m$, where m is the number of quadratic nonresidues in the series $1, \ldots, \frac{1}{2}(p-1)$. An interesting expression found for m is $\frac{1}{4}(p+1) - \frac{1}{2}(1 + h(-p))$, where $h(-p)$ denotes the number of classes of positive, primitive binary quadratic forms of discriminant $-4p$ (*cf.* section 6). In particular, it follows that there are more quadratic residues in the first half of the interval from 1 to $p-1$, than in the second half, if p is a prime $4n+3$.

Numerous generalizations of Fermat's and Wilson's theorems have been found. One due to Gauss (1801) is as follows: if P denotes the product of the integers less than and prime to n, then $P \equiv -1$ mod n if n is 4, p^k, or $2p^k$, where p denotes an odd prime; but $P \equiv 1$ mod n otherwise.

4. Quadratic Residues; The Quadratic Reciprocity Law.—A *quadratic residue* of m is an integer a prime to m such that $x^2 \equiv a$ mod m is solvable for x. Other integers a prime to m are called *quadratic nonresidues*. Let m be an odd prime p, and consider the squares $1^2, 2^2, \cdots, (p-1)^2$. Since $p \mid x^2 - y^2$ implies that $p \mid x - y$ or $x + y$, which can hold (if x, y are distinct numbers of the set $1, 2, \cdots, p-1$) only if $y = p - x$, it is plain that there are exactly $\frac{1}{2}(p-1)$ incongruent quadratic residues of p. Example: every square prime to p is of the form $pn + R$, where if $p = 3$, $R = 1$; if $p = 5$, $R = 1$ or 4; if $p = 11$, $R = 1, 4, 9, 5 (\equiv 4^2)$, or $3 (\equiv 5^2)$.

By extensive experiment Euler had found in 1783 a theorem of great simplicity, expressing a deep property of numbers. In 1785 A. M. Legendre rediscovered the same result, which he formulated as follows. Let p and q denote distinct odd primes. Then unless $p \equiv q \equiv 3 \pmod 4$ the two congruences $x^2 \equiv p \pmod q$ and $y^2 \equiv q \pmod p$ are both solvable or both unsolvable; but if $p \equiv q \equiv 3 \pmod 4$, one and only one of the two congruences is solvable.

Legendre introduced the useful symbol $(a \mid p)$, defined to equal $+1$ if a is a quadratic residue of p; -1, if a is a nonresidue; 0, if $p \mid a$. Then the above result takes the form

$$(p \mid q)(q \mid p) = (-1)^{\frac{1}{2}(p-1)\frac{1}{2}(q-1)},$$

for any distinct odd primes p and q. He called this the "reciprocity law." His proof was incomplete. In 1795, Gauss, at the age of 18, discovered the same law, and after a year of strenuous effort found a complete proof. Later he found 6 different proofs; and more than 50 proofs have appeared since.

The result at the end of section 3 can now be expressed by $a^{\frac{1}{2}(p-1)} \equiv (a \mid p)$ mod p, true also if $a \equiv 0$. Hence follow the following properties of the Legendre symbol: (1) $(a \mid p) = (b \mid p)$ if $a \equiv b$ mod p; (2) $(ab \mid p) = (a \mid p)(b \mid p)$; (3) $(-1 \mid p) = (-1)^{\frac{1}{2}(p-1)}$; and by another device, $(2 \mid p) = 1$ if $p \equiv \pm 1$ mod 8, $(2 \mid p) = -1$ if $p \equiv \pm 3$ mod 8.

The usefulness of the Legendre symbol was increased by C. G. J. Jacobi, who, defining $(a \mid p_1 p_2 \cdots p_n) = (a \mid p_1)(a \mid p_2)\cdots(a \mid p_n)$, and $(a \mid -k) = (a \mid k)$ if a is positive, found that the "reciprocity law" still holds for any odd numbers p and q not both negative. Example: determine whether $x^2 \equiv 30 \pmod{71}$ is solvable; $(30 \mid 71) = (2 \mid 71)(15 \mid 71) = (+1)(-)(71 \mid 15) = -(-4 \mid 15) = -(-1 \mid 15) = +1$; the congruence is solvable (with $x = \pm 32$). Example: of what primes is 3 a quadratic residue? $(3 \mid p) = (-1)^{\frac{1}{2}(3-1)\frac{1}{2}(p-1)}(p \mid 3) = +1$ if $p \equiv 1$ (mod 4 and mod 3), and if $p \equiv -1$ (mod 4 and mod 3); *i.e.*, $p \equiv \pm 1$ mod 12.

Other "reciprocity laws" have occurred in various generalizations; *e.g.*, one involving complex integers (section 18) occurred in Gauss's researches on biquadratic congruences.

5. Factorization of Numbers; Mersenne Primes.—The labour involved in factoring a large number of, say, 20 or more digits is still prohibitive. By expressing the number in special forms, it is possible to obtain limitations on the form of possible prime factors; thus, if $N = x^2 + ky^2$, where $(x, y) = 1$, then $-k$ must be a quadratic residue of each prime factor of N. Factor stencils have been developed to facilitate this process. A machine constructed by D. H. Lehmer ("A Photo Electric Number Sieve," *American Mathematical Monthly*, 40, 1933) makes it possible to test numbers of about 17 digits in a few hours. The best table of primes is D. N. Lehmer's *List of Prime Numbers from 1 to 10,006,721* (Carnegie Institution of Washington, D.C., 165, 1914).

"Perfect numbers" owe their origin to the number mysticism of the Pythagoreans (500 B.C.). A *perfect number* is an integer equal to the sum of its divisors less than itself. The five least are: $6 (= 1+2+3)$; 28; 496; 8,128; 33,550,336. Euclid gave the example $2^{p-1}(2^p - 1)$, which is perfect if and only if $2^p - 1$ is a prime. All even perfect numbers are of Euclid's type (Euler). No odd perfect number has ever been found.

Numbers of the form $2^p - 1$ are called *Mersenne numbers*, because in 1644 Father Marin Mersenne made a statement which implied that if $p \leqq 257$, $2^p - 1$ is prime only for $p = 2, 3, 5, 7, 13, 17, 19, 31, 67, 127, 257$. Subsequent work has yielded the following results: $2^p - 1$ is known to be prime for $p = 2, 3, 5, 7, 13, 17, 19, 31, 61, 89, 107, 127$; its factors are completely known for $p = 11, 23, 29, 37, 41, 43, 47, 53, 59, 67, 71, 73, 79, 113$, and partially known for $p = 83, 97, 131, 151, 163, 167, 173, 179, 181, 191, 197, 211, 223, 229, 233, 239, 251$; it has been proved composite for $p = 101, 103, 109, 137, 139, 149, 157, 199, 193$ and 227 (H. S. Uhler, 1948–49), 241 (R. E. Powers, 1934), 257 (M. Kraitchik and D. H. Lehmer, 1932). Several primes larger than $2^{127} - 1$ (E. Lucas, 1876) were found in 1951. The national bureau of standards Western Automatic computer gave, in 1952, the three next Mersenne primes $2^p - 1$ ($p = 521, 607, 1{,}279$).

The ancient Greeks knew that regular polygons of $2^h m$ sides, where $m = 3$ or 5, can be constructed by the Euclidian (straightedge and circle) operations. Gauss, at the age of 17, proved that these constructions are so performable if and only if m is a product of distinct "Fermat primes," *i.e.*, primes of the form $F_n = 2^{2^n} + 1$. If $n = 0, 1, 2, 3, 4$, we get the primes 3, 5, 17, 257,

65,537. But F_n is composite for $n=5$, 6, 7, 8, 9, 11, 12, 18, 23, 36, 38, 73.

REPRESENTATION BY FORMS

6. Binary Quadratic Forms.—Many special quadratic forms, such as $x^2 \pm ay^2$ or $x^2+y^2+z^2$, had been investigated by particular methods, before Lagrange and (especially) Gauss systematized their theory, and established general methods of attack. The guiding general principle was the linear transformation.

Consider for example a form in two variables and of the second degree (*i.e.*, a *binary quadratic form*) $f=ax^2+bxy+cy^2$. A number m is said to be *represented* by the form f if there exists a pair of integers u, v not both zero (called a *representation* of m by f) satisfying $au^2+buv+cv^2=m$. The representation is called *primitive* if the g.c.d. (u, v) is 1. We shall give a version of Gauss's method of finding whether a number m is represented by f.

The basic idea is that we treat not f alone, but an entire class of forms equivalent, for this purpose, to f. If we apply to f a *linear transformation*

$$x=\alpha X+\beta Y,\ y=\gamma X+\delta Y, \tag{1}$$

f is transformed into $F=AX^2+BXY+CY^2$ in new variables X and Y, while $A=a\alpha^2+b\alpha\gamma+c\gamma^2$, etc. On solving equations (1) for X and Y, we find

$$(\alpha\delta-\beta\gamma)X=\delta x-\beta y,\ (\alpha\delta-\beta\gamma)Y=-\gamma x+\alpha y.$$

Hence, in order to ensure that to each pair of integers x and y corresponds one and only one pair of integers X and Y, and conversely, we shall assume that the transformations which we apply are *unimodular*, that is, $\alpha, \beta, \gamma, \delta$ are integers, and $\alpha\delta-\beta\gamma=1$. Clearly the same numbers m are then represented by both forms f and F, and any representation x, y of m in f corresponds uniquely to the representation $X=\delta x-\beta y, Y=-\gamma x+\alpha y$ of m in F.

The forms f and F, related by a unimodular transformation, are termed *equivalent*. The result of applying several unimodular transformations in succession is easily seen to be another unimodular transformation, called their product. All forms equivalent to a given one are equivalent to one another, and are said to constitute a *class* of forms.

If $A=a\alpha^2+b\alpha\gamma+c\gamma^2$ where $(\alpha, \gamma)=1$, then by section 2 we can choose integers β and δ such that $\alpha\delta-\beta\gamma=1$. Consequently, any number A represented primitively by f is the first coefficient of some form $AX^2+BXY+CY^2$ equivalent to f. It can be shown that if β, δ is one solution of $\alpha\delta-\beta\gamma=1$, the most general solution is $\beta+k\alpha$, $\delta+k\gamma$, where k is any integer; and that B is then replaced by $B+2kA$.

The *determinant* of the form f is defined to be the number $d=ac-\frac{1}{4}b^2$. It can be shown that the determinants of equivalent forms are equal. (*See* ALGEBRAIC FORMS.)

The last result holds also for quadratic forms in n variables. We shall later use the terms determinant, class, representation, etc., for such forms, to which these terms can be extended in an obvious way. If a quadratic form f is written in the form $\sum a_{ij}x_ix_j$ (summed for $i, j=1, \cdots, n$), one can always suppose that $a_{ji}=a_{ij}$, and the determinant of f is the determinant $|a_{ij}|$. (*See* DETERMINANT.)

So far, a, b, c may denote any real numbers. We have $af=(ax+\frac{1}{2}by)^2+dy^2$. Hence if $d>0$, $a\neq 0$, and af is positive for any x and y not both zero; accordingly, f represents only numbers of one sign, that of a. But if $d<0$, f represents both positive and negative numbers. If $d>0$, we call f *definite*; specifically, *positive-definite* if also $a>0$; if $d<0$, f is called *indefinite*.

The treatment of definite and indefinite forms now diverges. It is easily shown that any positive-definite form is equivalent to precisely one form $Ax^2+Bxy+Cy^2$ satisfying

$$-A<B\leqq A\leqq C, \text{ with } B\geqq 0 \text{ if } C=A. \tag{2}$$

This form is called the *reduced form* in the class. We illustrate the process of reduction with the form $f=15x^2-44xy+33y^2$ of determinant $495-22^2=11$. Put $x=x_1+ky_1$, $y=y_1$. Then f becomes $15x_1^2+(-44+30k)x_1y_1+(\cdots)y_1^2$; to get $-44+30k$ between -15 and $+15$ take $k=1$, $f_1=15x_1^2-14x_1y_1+c_1y_1^2$; here $c_1=4$ since $15c_1-49=11$. Now treat similarly the smaller coefficient c_1, and replace x_1 by x_2, y_1 by $2x_2+y_2$, obtaining $f_2=3x_2^2+2x_2y_2+4y_2^2$, which is reduced. The result of combining the transformations is $x=3x_2+y_2$, $y=2x_2+y_2$, which transforms f directly into f_2.

Hereafter we assume f integral; *i.e.*, a, b, c are integers. The g.c.d. of a, b, c is called the *divisor* of f. If this g.c.d. is 1, f is called *primitive*. To avoid fractions write $D=-4d=b^2-4ac$, called the *discriminant* of f.

We prove in the case D negative that there are only a finite number of classes of integral, positive-definite, binary quadratic forms of a given discriminant $D=-\Delta$. This number is equal to the number of reduced forms satisfying (2), with $4AC=\Delta+B^2$. By (2), $4A^2\leqq 4AC=\Delta+B^2\leqq\Delta+A^2$, whence $A^2\leqq\frac{\Delta}{3}$, and $B^2\leqq\frac{\Delta}{3}$. To find all the reduced forms of discriminant $-\Delta$ we may therefore proceed as follows. Give B in turn each integer value such that $B^2\leqq\frac{\Delta}{3}$ and $4|\Delta+B^2$; factor $\frac{1}{4}(\Delta+B^2)$ as AC in all ways satisfying $|B|\leqq A\leqq C$. Discard forms such that $B=-A$ or such that $C=A$, $B<0$.

The number of classes of primitive, positive-definite, binary quadratic forms of discriminant D will be denoted by $h(D)$.

Example: Find the reduced forms of discriminant -44. Necessarily $B=2b$, $b^2\leqq\frac{11}{3}$. If $b=0$, $\frac{1}{4}(44+B^2)=11=1\cdot 11$; if $b=\pm 1$, $\frac{1}{4}(44+B^2)=12=2\cdot 6=3\cdot 4$. This yields four reduced forms: x^2+11y^2, $3x^2\pm 2xy+4y^2$, $2x^2+2xy+6y^2$. The last is imprimitive, with divisor 2; hence $h(-44)=3$.

The reader can verify that $h(D)=1$ in the twelve cases

$$-D=3, 4, 7, 8, 11, 12, 19, 27, 28, 43, 67, 163; \tag{3}$$

the reduced form being $x^2+xy+\frac{1}{4}(1-D)y^2$ or $x^2-\frac{1}{4}Dy^2$.

An *automorph* of f is a unimodular transformation carrying f into itself. Every f has the trivial automorph $x=x_1$, $y=y_1$; and its negative $x=-x_1$, $y=-y_1$. The form $a(x^2+y^2)$ has the additional automorphs $x=y_1$, $y=-x_1$; and its negative. The form $a(x^2+xy+y^2)$ has six automorphs, of which $x=x_1+y_1$, $y=-x_1$, is typical. All positive-definite forms not equivalent to these two have only the two trivial automorphs. It is easily proved that all the unimodular transformations carrying f into F are obtained by applying to f any automorph of f, followed by a fixed unimodular transformation of f into F.

We can now solve the problem of finding all primitive representations of A by f in the following manner, which applies equally well to indefinite forms (*cf* section 9). We noted above that to each primitive representation (α, γ) of A by f corresponds a form $Ax^2+Bxy+Cy^2$ equivalent to f, where B is uniquely determined mod $2A$. Equating discriminants, $B^2-4AC=D$.

Hence we start by finding all solutions B of

$$B^2\equiv D(\text{mod } 4A),\ 0\leqq B<2|A|. \tag{4}$$

For each such B construct the form $Ax^2+Bxy+\left(\frac{(B^2-D)}{4A}\right)y^2$, $=F_B$ say. By reducing both f and F_B to reduced forms we determine whether f is equivalent to F_B, and if so can construct all unimodular transformations carrying f into F_B. The coefficients α, γ of these transformations give all the primitive representations of A by f. Different solutions B of (4) cannot yield the same representation.

Example: Find all representations of 15 by $f=3x^2+2xy+4y^2$. The solutions of $B^2\equiv -44$ (mod 60), $0\leqq B<30$, are $B=4$, 14, 16, 26. If $B=4$, $F=15x^2+4xy+y^2$, which is equivalent to $x_1^2+11y_1^2$ under the transformation $x_1=2x+y$, $y_1=-x$; the corresponding representations in $x_1^2+11y_1^2$ are therefore 2, -1 and -2, $+1$. Similarly, $B=26$ yields 2, 1 and -2, -1 in $x_1^2+11y_1^2$. If $B=-14$, $F=15x^2-14xy+4y^2$, and we find the representations 1, -2 and -1, 2 in f; $B=16$ yields similar representations in $3x^2-2xy+4y^2$. Thus there are eight representations of 15 in the system of three reduced forms, two of them in f.

By a set of representations of A in f, we mean the set obtained from a given representation by applying the automorphs of f. This has a meaning even in the indefinite case when the number

of automorphs may be infinite. The preceding process proves the following important result formulated by P. G. L. Dirichlet and equally true when f is indefinite:

Theorem: The number of sets of primitive representations of an integer A by the system (one form from each class) of binary quadratic forms of a given discriminant D is equal to the number of solutions of (4).

In a large number of special cases, this theorem provides immediate information on the number of representations in single forms. This is obviously true in the 12 cases in (3). For example, taking $D=-4$, we obtain the following result: a positive integer A is represented primitively as a sum of two squares if and only if A contains no prime factor of the form $4n+3$ and A is not divisible by 4; and then the number of representations is $4\cdot 2^k$, where k denotes the number of distinct prime factors of A of the form $4n+1$.

By counting the primitive representations of $\frac{A}{s^2}$, for square factors s^2 of A, various formulas are obtainable for the number of sets of all representations by the system of reduced forms of discriminant D; one such formula, in the special case $(A, 2D)=1$, is $\sum_{k|A}(D|k)$; *i.e.*, the sum of the Legendre symbols $(D|k)$ for all the positive divisors k of A. Thus, in particular, the only positive integers A not represented by x^2+y^2 are those containing a prime factor $4n+3$ to an odd power; while, if $A=2^c p_1^{a_1}\cdots p_r^{a_r}t^2$, where the r ($\geqq 0$) distinct primes p_i are of the form $4n+1$, and no prime in t is of that form, then the number of all representations of A as x^2+y^2 is $4(a_1+1)\cdots(a_r+1)$.

7. Genera of Quadratic Forms; Formulas for Number of Representations.—The last theorem provides a general formula for the number of representations of a number by a system of several classes of forms. A smaller system of great importance, of which many general properties are known is the *genus*.

A natural approach to the notion of genus may be derived from the following observations. If an integral form say $f=ax^2+bxy+cy^2$, represents a number A, say $f(u, v)=A$, then obviously the congruence $f\equiv A$ mod m is solvable (with $x=u$, $y=v$) whatever be the modulus m. However, $2x^2+7y^2\equiv 1 \pmod{p^r}$ is solvable for every prime p and positive r, and hence solvable for every m; *e.g.*, with $3x\equiv 1$, $3y\equiv 1$, if $p\neq 3$, with $5x\equiv 3$, $5y\equiv 1$, if $p\neq 5$. But $2x^2+7y^2$ does not represent 1. The situation here is that there is associated with $2x^2+7y^2$ another class of forms, that of x^2+14y^2, which while not equivalent to $2x^2+7y^2$, is "equivalent to it for all congruencial purposes." And x^2+14y^2 does represent 1. The two classes, represented by x^2+14y^2 and $2x^2+7y^2$, happen to constitute a "genus." As another example, x^2+y^2 happens to be in a genus of one class, and x^2+y^2 represents a positive integer A if and only if the congruence $x^2+y^2\equiv A$ mod m is solvable, for all m.

We shall call two integral forms *equivalent in the field of reals* if each is transformable into the other by linear transformations with real coefficients; *e.g.*, if $n=2$, both must be positive-definite, both negative-definite, or both indefinite. Two forms are defined to be in the same *genus* if they have the same determinant d, are equivalent in the field of reals, and if for every modulus m (the modulus $2^n d$ being in fact sufficient) each is equivalent to a form whose coefficients are congruent mod m to the corresponding coefficients of the other.

There are several other sets of properties which distinguish a genus. Two quadratic forms in n variables are in the same genus if and only if they have the same determinant d and there exists a linear transformation, whose coefficients are rational numbers with denominators prime to $2^n d$, transforming one form into the other. For example, $2x^2+7y^2$ is carried into $x_1^2+14y_1^2$ by the transformation $x=\frac{(x_1+7y_1)}{3}$, $y=\frac{(x_1-2y_1)}{3}$. The proof of the necessity of this criterion was completed for $n>3$ only in 1940 by C. L. Siegel. Historically, genera have usually been characterized by means of sets of (more or less) easily computable invariants; Gauss (1801, $n=2$), G. Eisenstein (1847, $n=3$), H. J. S. Smith (1867, $n\geqq 3$), H. Minkowski (1884), B. W. Jones and G. Pall (1944). The most important of these are illustrated in section 8 for $n=3$.

Equivalent forms are in the same genus. A genus consists of a finite number of classes. If $n\geqq 4$, indefinite forms are in genera of one class; this is true also if $n=3$, save in certain exceptional cases. It is probable that there are only finitely many classes of primitive, positive-definite forms in genera of one class; there are none in more than 35 variables (W. Magnus, 1938), and probably none in more than 10 variables. As an example, the three primitive forms of discriminant -44, preceding (3) in section 6, constitute a genus of three classes. The form $x_1^2+\cdots+x_n^2$ is in a genus of one class only if $1\leqq n\leqq 8$.

Some writers prefer to define "class" by means of transformations of determinant ± 1, instead of Gauss's $+1$. Perhaps the main reason for preferring $+1$ is the following theorem formulated by Gauss: every genus of primitive, binary, quadratic forms of discriminant D contains the same number of classes. The situation if $n\geqq 3$ is somewhat different.

Consider a genus of primitive forms in $n(\geqq 2)$ variables. We assume the forms to be positive-definite, while mentioning that C. L. Siegel (1936), with a suitable meaning for sets of representations, has extended the results which follow to indefinite forms. Let h denote the number of classes in the genus, and select one form $f_i (i=1, \cdots, h)$ from each class. Let w_i denote the number of automorphs of f_i. The quantity $\frac{1}{w_1}+\cdots+\frac{1}{w_h}$ is called the *weight of the genus*. A remarkable formula for the weight of a genus was suggested for $n=3$ by Eisenstein, and was proved and generalized to any n by H. J. S. Smith (1867) and Minkowski (1884). Further, under certain restrictions, the total number of primitive representations of an integer m by the system of forms f_i of a genus was shown to be equal to the weights of certain related genera. These results were generalized in 1935 by Siegel, to yield a formula for the numbers of representations (suitably weighted) of forms in k variables by a genus of forms in n variables; the case $k=1$ is that of representation of numbers stated in the following paragraph.

Let $f_i(A)$ equal the number of representations of A by f_i. Then

$$\frac{\frac{f_1(A)}{w_1}+\cdots+\frac{f_h(A)}{w_h}}{\frac{1}{w_1}+\cdots+\frac{1}{w_h}}=\frac{\pi^{\frac{1}{2}n}A^{\frac{1}{2}n-1}S(A)}{\Gamma(\frac{1}{2}n)\cdot d^{\frac{1}{2}}} \tag{1}$$

where d denotes the determinant of f, $\Gamma(\frac{1}{2}n)$ is the well-known gamma-function (for which $\Gamma(m)=1\cdot 2\cdot 3\cdots(m-1)$ if m is a positive integer), $S(A)$ denotes the product extended over all primes p,

$$S(A)=\chi(2)\cdot\chi(3)\cdot\chi(5)\cdot\chi(7)\cdots,$$
$$\text{where } \chi(p)=\lim_{r\to\infty} p^{-(n-1)r}f(A, p^r),$$

while $f(A, p^r)$ (which can be evaluated by various methods) denotes the number of solutions of the congruence $f\equiv A \pmod{p^r}$. This general expression simplifies remarkably when n is even, and provides a neat formula for the number of representations of an integer A by a genus; hence by a form if the genus consists of one class.

We select several examples. Let $r_n(A)$ denote the number of representations of A as a sum of n squares. For example, $r_4(13)=112$, since $13=3^2+2^2+0^2+0^2=2^2+2^2+2^2+1^2$, and we can permute and change signs of 3, 2, 0, 0 in 48 ways, of 2, 2, 2, 1 in 64 ways. Set $A=2^k m$, m odd, $k\geqq 0$. If $n=2, 4, 6, 8$ (when the genus of $x_1^2+\cdots+x_n^2$ consists of one class), $r_n(A)$ has the following expressions in terms of the positive divisors d of m:

$$r_2(A)=4\sum_{d|m}(-1)^{(d-1)/2},$$
$$r_6(A)=4\{(-1)^{(m-1)/2}4^{k+1}-1\}\sum_{d|m}(-1)^{(d-1)/2}d^2,$$
$$r_4(A)=8\{2+(-1)^A\}\sum_{d|m}d,$$
$$r_8(A)=\frac{16}{7}|8^{k+1}-15|\sum_{d|m}d^3.$$

Similar expressions have been obtained for many other forms in genera of one class; and for special forms of A by forms in genera of more than one class. For example, if A is of the form $4r+3$, $r_{10}(A)=12\sum(-1)^{(d+1)/2}d^4$, and if A is even there is a simple expression for $r_{12}(A)$.

The formula for $r_4(A)$ was first obtained in 1828 by C. G. J. Jacobi, by equating coefficients in the expansions of certain eliptic functions. In a series of 18 articles (1858–65), J. Liouville stated without proof several identities and derived from them expressions for the number of representations by numerous quadratic forms. The proofs of these identities are elementary, although as shown by E. T. Bell, many can be paraphrased from elliptic function identities by replacing sine and cosine terms by more general odd and even functions.

As an example we quote one of Uspensky's identities. Let $F(x, y, z)$ denote a function odd with respect to x, and even with respect to y, z; *i.e.*, $F(-x, y, z)=-F(x, y, z)$ and $F(x, -y, -z) =F(x, y, z)$. Then

$$2\sum F(\delta-2i,\ d+i,\ 2d+2i-\delta)=\sum F(d+\delta,\ i,\ d-\delta)+2T-U,$$

where the summations extend over all integral solutions of $n=i^2+d\delta$, with d and δ positive. Both T and U are zero unless $n=s^2(s>0)$, in which case

$$T=\sum_{j=1}^{2s-1} F(2s-j,\ s,\ 2s-j),\quad U=\sum_{j=1}^{2s-1} F(2s,\ j-s,\ 2j-2s).$$

By various specializations of this formula, James Victor Uspensky obtained a large number of expressions for the numbers of representations by quadratic forms in two, four, six, eight, and ten variables; and all the known and certain new relations connecting binary quadratic class-numbers for various determinants.

H. D. Kloosterman and V. Tartakowsky showed, about 1924, that (1) gives an asymptotic formula for the number of representations by a single form f_i, if $n\geqq 4$. (*Cf.* section 12).

8. The Numbers Represented by a Quadratic Form; Universal Forms; Representation of Zero.—We shall make certain observations about the numbers represented by an integral quadratic form. As we implied earlier, a genus has the property that if $f\equiv A \bmod m$ is solvable for every m, and if A has the necessary sign when f is positive- or negative-definite, then some form in the genus of f represents A. For example, the two forms $f=x^2+y^2+10z^2$ and $g=2x^2+2y^2-2yz+3z^2$ are representative of the two classes of a certain genus of determinant 10. It is easily proved that $f\equiv A \bmod p^r$ is solvable for every A and p, except when $p=2$, r is large enough, and A is of the form $4^h(16k+6)$. Hence f and g represent between them all positive integers not of the form $4^h(16k+6)$. It might be supposed that f and g would each represent all large numbers not of the excluded form. It is easily proved that f represents all even numbers not of the excluded form; and Hansraj Gupta (1941) stated the odd numbers up to 20,000 not represented by f: 3, 7, 21, 31, 33, 43, 67, 79, 87, 133, 217, 219, 223, 253, 307, 391, 679, 2,719. But examples exist of two ternary classes in the same genus which do not represent the same large numbers.

In any case, if the genus of f consists of one class, the numbers represented by f can be determined by investigating the solvability of the congruences $f\equiv A \pmod{p^r}$. In this way we find that $x^2+y^2+z^2$ represents all positive integers not of the form $4^h(8k+7)$, and that $x^2+y^2+z^2+t^2$ represents all positive integers.

V. Tartakowsky (1925) showed that each class of positive-definite forms in five or more variables represents all the large numbers represented by its genus. This is not quite always true when $n=4$, but the exceptions are known. It is definitely false (save in the trivial case of "improperly equivalent forms" such as $3x^2\pm 2xy+4y^2$) for binaries.

A quadratic form is called *universal* if it is positive-definite and represents all positive integers, or indefinite and represents all nonzero integers. Every universal binary is equivalent to xy. Every universal ternary with even cross-product coefficients was shown by L. E. Dickson to be equivalent to $2xy-Hz^2$ (H odd) or $2xy+y^2-Hz^2$ ($H\equiv 2 \bmod 4$); if any cross-product coefficient is odd, A. Oppenheim showed it to be equivalent to $xy-Hz^2$.

Srinivasa Ramanujan (1917) examined the forms $ax^2+by^2+cz^2+dt^2$, where a, b, c, d are positive integers, $a\leqq b\leqq c\leqq d$; he found at most 54 such forms which may represent all positive integers. Dickson completed the proof of their universality in 1927. A complete proof, including forms with odd cross-products, that there are only finitely many classes of positive-definite, universal quaternaries, was first given by A. E. Ross. Dickson proved that every universal ternary is a *zero-form.*

A zero-form is a form which represents zero for values of its variables not all zero. The theorem that every indefinite form in five or more variables is a zero-form was formulated by A. Meyer (1884). Trivially, a binary form is a zero-form if and only if its discriminant is a square. We shall suppose a ternary or quaternary to have been transformed into the form $f_3=a_1x_1^2+a_2x_2^2+a_3x_3^2$ or $f_4=a_1x_1^2+a_2x_2^2+a_3x_3^2+a_4x_4^2$, and shall formulate necessary and sufficient conditions for such a form to represent zero. The symbol $(a, b)_p$ may be defined (*cf.* section 4) as follows, by writing $a=p^\alpha m$, $b=p^{\alpha'}m'$, where m and m' are prime to p, and α, α' are integers:

$$\text{if } p>2,\ (a, b)_p=(-1|p)^{\alpha\alpha'}(m|p)^{\alpha'}(m'|p)^{\alpha};$$
$$\text{if } p=2,\ (a, b)_2=(-1)^{(m-1)(m'-1)/4}(2|m)^{\alpha'}(2|m')^{\alpha}.$$

The conditions are expressed in terms of the "characters"

$$c_p(f_3)=(-a_1a_2,\ -a_1a_3)_p,\quad c_p(f_4)=(a_1,\ a_2)_p(-a_3,\ -a_4)_p.$$

The former is an invariant of f_3 under rational linear transformations. The latter is needed for our present purpose only when $a_1a_2a_3a_4$ is of the form s^2k, where k is a quadratic residue mod p^r; *i.e.*, $(k|p)=1$ if $p>2$, $k\equiv 1 \bmod 8$ if $p=2$. Evidently, $c_p(f_3)=1$ unless $p|2a_1a_2a_3$. We state finally: f_3 is a zero-form if and only if $c_p(f_3)=1$ for every p; f_4 is a zero-form if and only if $c_p(f_4)=1$ for every prime p such that $a_1a_2a_3a_4$ is of the above-specified form.

The theory of quadratic forms in rational coefficients, and for rational values of the variables, is much simpler than that in the domain of integers; attention should be drawn to Hasse's elegant development of this theory in the *Journal für Mathematik* for 1923.

9. Automorphs and Reduction of Indefinite Binary Quadratic Forms.—Any real, irrational number θ can be expanded into a continued fraction

$$a_0+\cfrac{1}{a_1+\cfrac{1}{a_2+\cdots}},\ \text{abbreviated } a_0+\frac{1}{a_1+}\ \frac{1}{a_2+}\cdots,$$

where the a_i are integers, and a_1, a_2, $\cdots$ positive. Indeed, we can write $\theta=a_0+\frac{1}{b_1}$, where a_0 is an integer and $b_1>1$; then write $b_1=a_1+\frac{1}{b_2}$, where a_1 is a positive integer and $b_2>1$; and so on. Since θ is irrational, the process cannot terminate. The rational fraction

$$\frac{p_n}{q_n}=a_0+\frac{1}{a_1+}\ \frac{1}{a_2+}\cdots\frac{1}{a_n},(p_n,\ q_n)=1,\ q_n>0.$$

obtained by stopping at a_n, is called the nth *convergent to* θ. It can be proved that $|\theta-\frac{p_n}{q_n}|<\frac{1}{q_n^2}$; and that $\frac{p_n}{q_n}$ is a closer approximation to θ than any other rational fraction with denominator not exceeding q_n.

Lagrange observed that the continued fraction is periodic if and only if θ is a root of a quadratic equation of the type $a-b\theta+c\theta^2=0$, where a, b, c are integers. Here $\theta=\frac{(b+r)}{(2c)}$, where $r^2=D=b^2-4ac$. As a typical example, consider $a=40$, $b=-45$, $c=12$, $D=105$. Then $\theta=\frac{(-45+r)}{24}=-2+\frac{(3+r)}{24}$, $b_1=\frac{24}{(r+3)}=\frac{(r-3)}{4}=1+\frac{(r-7)}{4}$, $b_2=\frac{4}{(r-7)}=\frac{(r+7)}{14}=1+\frac{(r-7)}{14}$, $b_3=\frac{14}{(r-7)}=\frac{(r+7)}{4}=4+\frac{(r-9)}{4}$, $b_4=\frac{4}{(r-9)}=\frac{(r+9)}{6}=3+\frac{(r-9)}{6}$, $b_5=\frac{6}{(r-9)}=\frac{(r+9)}{4}=4+\frac{(r-7)}{4}$, $b_6=\frac{4}{(r-7)}=b_2$. Hereafter, the period b_2,

$\cdots, b_5$ recurs.

The preceding discussion should help to explain Gauss's method of reduction of binary quadratic forms of a positive nonsquare discriminant D. Instead of a single reduced form (as in the case $D<0$), each class contains a chain of reduced forms. In the case of $f=40x^2-45xy+12y^2$ this chain consists of the forms $\phi_1=-2x^2+7xy+7y^2$, $\phi_2=7x^2+7xy-2y^2$, $\phi_3=-2x^2+9xy+3y^2$, $\phi_4=3x^2+9xy-2y^2$. These correspond to the period of the recurring continued fraction above, and can be obtained from f by applying in order the following unimodular transformations: $x\to -y$, $y\to x-2y$, to get $12x^2-3xy-2y^2$ (not yet reduced); to the latter form, $x\to -y$, $y\to x-y$ to get ϕ_1; then, $x\to -y$, $y\to x+y$, ϕ_2; $x\to -y$, $y\to x-4y$, ϕ_3; $x\to -y$, $y\to x+3y$, ϕ_4; $x\to -y$, $y\to x-4y$, giving $\phi_5=\phi_1$; etc. In general, $ax^2+bxy+cy^2$ is reduced if and only if $ac<0$, $b>0$, $0<r-b<2|a|<r+b$, where $r=\sqrt{D}$.

To complete the theory of section 6, we observe that all the automorphs of a primitive form $ax^2+bxy+cy^2$ of discriminant D are given by

$$x=\tfrac{1}{2}(t-bu)X-cuY,\ y=auX+\tfrac{1}{2}(t+bu)Y,$$

where t, u range over all integral solutions of Fermat's equation (usually called Pell's equation), $t^2-Du^2=4$. If D is a positive nonsquare integer, Fermat's equation can be shown to have a least solution T, U in positive integers (which can be found from a single period of the continued fraction for $\sqrt{D}$), and all integral solutions t, u are given by

$$\tfrac{1}{2}(t+u\sqrt{D})=\pm(\tfrac{1}{2}(T\pm U\sqrt{D}))^k,\ k=0,\ 1,\ 2,\ \cdots$$

I. Schur (1918) showed that $\frac{1}{2}(T+U\sqrt{D})<D^e$, with $e=D^{\frac{1}{2}}$.

10. Diophantine Equations.—Diophantus of Alexandria (250 A.D.) was the first to treat systematically the solutions of equations or systems of equations in integral (or sometimes in rational) values of the unknowns. Such problems are called after his name. Infallible methods are available only for a few special cases, such as a system of linear equations, or a single quadratic equation. For a fuller discussion, *see* DIOPHANTINE EQUATIONS; FERMAT'S LAST THEOREM.

We noticed in the preceding section that if D is any positive integer (not a square), then $x^2-Dy^2=1$ has infinitely many integral solutions. An important theorem of A. Thue and C. L. Siegel shows that on the contrary, if $f(x, y)$ is of degree $\geqq 3$ (and is not a power of a linear or quadratic function), and if c is a given nonzero number, then $f(x, y)=c$ has at most a finite number of integral solutions.

TOPICS IN ANALYTIC NUMBER THEORY

11. Gauss's Class-number Conjecture—*The Riemann Zeta Function Conjecture.*—We saw in section 6 that the number $h(D)$ of classes of primitive binary quadratic forms of discriminant D is finite, and noted 12 negative discriminants for which $h(D)=1$. No other negative D satisfying $h(D)=1$ has ever been found. L. E. Dickson showed in 1922 that there are no others up to $-D=15.10^5$, and D. H. Lehmer carried this in 1933 to -5.10^9. In 1934, H. Heilbronn and E. H. Linfoot proved that at most one other negative D exists satisfying $h(D)=1$.

On the other hand, if D is positive, the tables show numerous values of D such that $h(D)=1$, and indeed Dirichlet showed that there are infinitely many positive integers D with this property.

In *Disquisitiones Arithmeticae*, 1801, art. 303, will be found Gauss's conjecture that, as D tends to infinity through negative values, $h(D)$ tends to infinity. This conjecture was first proved by Heilbronn in 1934. Some of the developments preceding and following Heilbronn's proof are of interest. The analytic tools used in proving this and later results to be described began their development in the 19th century. Lejeune Dirichlet, who called his great memoir of 1839, "Diverse Applications of Infinitesimal Calculus to Number Theory," is generally regarded as the founder of analytic number theory. After Dirichlet, it was G. F. B. Riemann who made the most fundamental advance.

The "Riemann Zeta Function" which he introduced, may be defined by means of the series $\zeta(s)=1+\frac{1}{2^s}+\frac{1}{3^s}+\frac{1}{4^s}+\cdots$. Here s is a complex variable, taking values of the type $s=\sigma+it$, where σ and t are real numbers, and $i^2=-1$. The series is convergent only if $\sigma>1$, but determines by a process known as analytic continuation, a function defined and "regular" for all complex values s, except that it has a pole (a kind of infinity) at the point $s=1$. A great deal is known about this function today. Riemann, in 1859, knew that $\zeta(s)=0$ if s is any negative even integer, and that all the remaining zeros of $\zeta(s)$ satisfy $0<\sigma<1$ and lie symmetrically about the straight lines $\sigma=\frac{1}{2}$ and $t=0$. Riemann conjectured that all these "nontrivial" zeros of $\zeta(s)$ lie on the straight line $\sigma=\frac{1}{2}$. Up to 1952 it was not known whether this was true or false. It may be mentioned that G. H. Hardy proved that there are infinitely many zeros on the line $\sigma=\frac{1}{2}$, and that E. C. Titchmarsh has located all zeros up to $t=200$.

The Riemann zeta function conjecture poses one of the most significant unsolved problems of modern mathematics. A conjecture similar to Riemann's can be made for a somewhat more general set of functions,

$$L(s, \chi)=\sum_{n=1}^{\infty}\frac{\chi(n)}{n^s}$$

known as the Dirichlet L-functions. We will not describe the $\chi(n)$, except to say that they are called *characters*, and have values ± 1 or 0 or roots of unity. The conjecture that there are no zeros of the L-functions with real part $\sigma>\frac{1}{2}$ is known as the Generalized Riemann Hypothesis (G.R.H.).

These conjectures are connected with several interesting questions. It seemed to be important to deduce results by assuming the truth of the G.R.H., in the hope that they might throw some light on the subject. For example, Hardy and J. E. Littlewood proved in 1923 on the basis of the G.R.H. slightly modified, that every sufficiently large odd number is equal to the sum of three odd prime numbers (*see* section 15). Again, in 1913, E. Hecke proved that if the G.R.H. holds true for all real-valued characters χ, then Gauss's conjecture about $h(D)$ follows.

These results did not of course prove that every large odd number is the sum of three primes, or that $h(D)$ tends to infinity, but they have an interesting aftermath. In the case of Hecke's result the climax came in 1934. M. Deuring proved in 1933 that if $\zeta(s)$ has at least one zero with real part greater than $\frac{1}{2}$, then $h(D)=1$ for only a finite number of negative discriminants D, and this was soon followed by the theorem of Heilbronn and Linfoot mentioned earlier. Then L. J. Mordell proved in 1934 that if $\zeta(s)$ has at least one zero with real part greater than $\frac{1}{2}$ then $h(D)$ tends to infinity. Finally, Heilbronn proved in 1934 that if there exists at least one real character χ for which $L(s)=0$ for a value s with $\sigma>\frac{1}{2}$, then $h(D)$ tends to infinity. Thus by Hecke's work, Gauss's conjecture is correct if the Riemann hypothesis is true for all real characters χ; and by Heilbronn's work, Gauss's conjecture follows if the Riemann hypothesis for real characters χ is false. It follows that Gauss's conjecture is true, but nothing can be concluded about the truth of the Riemann hypothesis itself. As a sort of anticlimax it should be mentioned that S. Chowla immediately revised Heilbronn's proof to make it independent of Hecke's work.

C. L. Siegel immediately followed with a brief proof that

$$\frac{\log h(D)}{\log|D|}\to\tfrac{1}{2}\text{ as }D\to-\infty.$$

thus giving an actual measure of how rapidly $h(D)$ tends to infinity. Siegel's formula has made possible other developments, such as I. M. Vinogradow's startling achievement of 1937, when he proved (without any unproved hypothesis) that every large odd number is a sum of three odd primes.

12. Distribution of Primes; Asymptotic Formulas.—In 1837 Dirichlet proved that there are infinitely many primes in any arithmetic progression $my+n(y=0,\ 1,\ 2,\ \cdots)$, where m and n are any given coprime integers, m positive. In his article, analytic methods using fairly deep results from the theory of functions were first introduced into the theory of numbers. A number of special cases, notably $my\pm 1$, have been proved by strictly elementary methods. It is not known whether quadratic expressions such as x^2+1 represent infinitely many primes. However,

if $f=au^2+buv+cv^2$ is primitive and not negative-definite, if $(m, n)=1$ and the congruence $f\equiv n \bmod m$ is solvable, then f represents infinitely many primes of the form $my+n$.

Consider two functions $f(x)$ and $g(x)$ which tend to infinity with x. Examples are $\pi(x)$ = the number of primes up to x; and the function $\frac{x}{\log_e x}$. If the ratio $\frac{f(x)}{g(x)}$ tends to 1 as a limit when x tends to infinity, we say that $f(x)$ *is asymptotic to* $g(x)$, abbreviated $f(x)\sim g(x)$. The difference $f(x)-g(x)$, or "error" in approximating $f(x)$ by $g(x)$, may then still become large with x, but will be of smaller order of size than $g(x)$. It is frequently important to estimate the magnitude of this error. The notation used for this purpose is illustrated by the equation $(x+1)^3=x^3+O(x^2)$; which means that there exists a positive constant c such that, for all sufficiently large values of x, $|(x+1)^3-x^3|<cx^2$; here, $|3x^2+3x+1|<7x^2$ if $x>1$. Generally, if F is a positive function of x, $O(F)$ denotes a function of x which, for all sufficiently large x, does not exceed cF in absolute value, where c is a positive constant. Examples: $\sin x=O(1)$, $(\log x)^{10}=O(x)$.

P. L. Tchebychef gave asymptotic formulas for $\sum\frac{1}{p}$ and $\Pi\left(1-\frac{1}{p}\right)$, where p ranges over the primes less than x; and proved Bertrand's postulate on the existence of a prime between x and $2x (x\geqq 2)$. Asymptotic formulas for $\pi(x)$ had been suggested by Legendre and Gauss. The simplest formula is $\pi(x)\sim x/\log x$, proved independently by J. Hadamard and C. de la Vallée Poussin in 1896. A closer approximation is given by

$$\int_2^x \frac{dx}{\log_e x} \qquad (1),$$

the error being proved by Littlewood (1924) to be $o(xe^{-t})$, with $t^2=k\log x\log\log x$ (k a positive constant); and improved by N. Tchudakov (1947) to $t=(\log x)^\delta$, $\delta=0\cdot6-\epsilon$. The Riemann zeta function hypothesis (section 11) is equivalent to the statement that the error in (1) is $O(x^{\frac{1}{2}}\log x)$.

We state a few of the simplest examples of asymptotic formulas for number-theoretic functions. For Euler's function $\phi(n)$ (section 2), $\phi(1)+\phi(2)+\cdots+\phi(n)=\frac{3n^2}{\pi^2}+O(n\log n)$. The number of pairs of integers u, v satisfying $u^2+v^2\leqq x$ is $\pi x+O(x^{1/3})$. This exponent $\frac{1}{3}$ can be lowered, though it must exceed $\frac{1}{4}$, and exceedingly delicate analysis has gone into proving that we can take the exponent as low as $\frac{13}{40}$. If x is a prime, the least primitive root (section 2a) of x is $O(x^{\frac{1}{4}+\epsilon})$, where ϵ is any desired positive number. If $r(x)$ denotes the number of representations of the integer x as a sum of three squares, and x is not of the form $4n$ or $8n+7$, then $\log r(x)\sim\log\sqrt{x}$ (Siegel, 1935).

A recent development of interest is the elementary proof of the fact that $\pi(x)\sim x/\log x$, by Atle Selberg (1949). His method also was applied to prove Dirichlet's theorem on the infinitude of primes in an arithmetic progression. In the same year, an elementary proof of Dirichlet's theorem based on algebraic numbers (*cf.* section 18) was published by H. Zassenhaus.

An interesting, as yet unproved, conjecture states there exist infinitely many pairs of primes differing by two (*e.g.*, 3, 5; 197, 199); such pairs are called twin primes. However, if their number is infinite, they are distributed much more sparsely than the primes themselves, since, as was shown by Viggo Brun in 1921, the sum of the reciprocals of the twin primes is finite, while the sum of the reciprocals of all primes is infinite.

ADDITIVE THEORY OF NUMBERS

A typical problem of the additive theory of numbers may be described as follows. Consider a set S of integers $a_1, a_2, \cdots$; *e.g.*, S might contain the primes, or the cubes of primes, or the squares. Let $r(n)$ denote the number of representations of a positive integer n as a sum of s elements a_i of S. The problem is to find out what we can about $r(n)$; *e.g.*, whether $r(n)$ is always positive; or positive for all sufficiently large n; or to obtain an exact or approximate formula for $r(n)$.

13. Partitions. In particular, if $S=(1, 2, 3, \cdots)$, consists of all positive integers, the number s of summands is unrestricted, repetitions are allowed, and order is irrelevant, we have the problem of "unrestricted partitions"; *i.e.*, of expressing a positive integer n as a sum of positive integers. Thus 4 has five partitions: 4, 3+1, 2+2, 2+1+1, 1+1+1+1.

A number of interesting facts can be proved by elementary methods, such as representing a partition by an array of dots, and collecting these dots in different orders. Thus: the number of partitions of n into m parts is equal to the number of partitions of n into parts the largest of which is m. If $p(n)$ denotes the number of partitions of n, then

$$1+\sum p(n)x^n=\frac{1}{\{(1-x)(1-x^2)(1-x^3)\cdots\}},$$

called a generating function for $p(n)$. Generating functions are constructible for partitions variously restricted; *e.g.*, into odd parts, unequal parts, parts of the form $5n\pm1$, etc. By transformation of generating functions results such as the following appear (those stated being first given by Euler): the number of partitions of n into unequal parts is equal to the number of its partitions into odd parts; if $E(n)$ is the number of partitions of n into an even number of unequal parts, and $U(n)$ the number into an odd number of unequal parts, then $E(n)-U(n)=0$ unless n is of the form $\frac{1}{2}k(3k\pm1)$, when $E(n)-U(n)=(-1)^k$. Again, the number of partitions of n into parts which differ by at least 2 is equal to the number of partitions into parts of the form $5m\pm1$.

Among the most important recent developments, we should mention an asymptotic formula for $p(n)$, developed by Hardy and Ramanujan (1917); and an exact expression for $p(n)$ by an infinite series, presented by H. Rademacher (1937).

14. The Waring Problem, and Related Problems.—Interest in forms capable of representing all positive integers goes back to Diophantus, of the 3rd century, who (according to Bachet de Méziriac, 1621) assumed that every positive integer is a sum of four squares. Fermat (1636) stated that: "every number is either triangular or the sum of two or three triangular numbers; every number is either a square or a sum of two, three, or four squares; either pentagonal, or the sum of two, three, four, or five pentagonal numbers; and so on ad infinitum whether it is a question of hexagonal, heptagonal, or any polygonal numbers." (If billiard balls are stacked into a triangle, the number of balls will be $1+2+\cdots+x=\frac{1}{2}x(x+1)$, called a triangular number. Generally, a *polygonal number* of order m is given by $x+\frac{1}{2}(m-2)(x^2-x)$, where $x=0, 1, 2, \cdots$; the squares are obtained when $m=4$.) Fermat's theorem is that every positive integer is a sum of m polygonal numbers of order m.

This theorem was proved for squares by Lagrange (1772), for triangular numbers by Legendre (1798), for the remaining cases by Cauchy (1813–15).

In 1770 E. Waring stated an extension of the four square theorem in the direction of higher powers: every positive integer is a sum of at most 9 (positive, integral) cubes, also a sum of at most 19 fourth powers, at most 37 fifth powers, and in general of a limited number (whose least value we will denote by $g(k)$) of kth powers. That at least 9 cubes are required follows from the fact that 23 and 239 cannot be represented by sums of fewer cubes. The son of the great Euler noticed an integer which requires at least $2^k-2+\left[\left(\frac{3}{2}\right)^k\right]$ kth powers. Here the symbol $[t]$ denotes the greatest integer in t.

The function $G(k)$ giving the least number of kth powers required to represent all but a finite number of positive integers is of even greater interest. Evidently $G(k)\leqq g(k)$. By Lagrange's result, $G(2)=g(2)=4$.

Starting about the middle of the 19th century, the finiteness of $g(k)$ was gradually proved by means of elementary but complicated methods, first for $k=4$, then for $k=3, 5, 6, 7, 8, 10, 12$ and 14; and finite upper bounds to $g(k)$ (which, except for $k=3$,

were not best possible) were obtained. The problem of finding anything general about $g(k)$ or $G(k)$ seemed hopeless until D. Hilbert, in a famous paper of 1909, proved the fact that $g(k)$ is finite for every k. His proof is not exactly elementary, since it is based on the transformation of a 5-fold integral (in his first presentation, a 25-fold integral). The transcendental character of his proof was gradually eliminated by various writers, but it is still a pure existence proof and gives no method of estimating $g(k)$.

The really great invention which opened up the whole subject was the work (1917 on) of Hardy and Littlewood, and Ramanujan (Hindu, died in 1920). A very important step depended on H. Weyl's previous investigation of exponential sums. By use of A. L. Cauchy's integral formula (*See* FUNCTION), an expression can be constructed for the coefficient c_n in the expansion of

$$(1+x^{1^k}+x^{2^k}+\cdots)^s=\sum_{n=0}^{\infty}c_nx^n.$$

Briefly, the main contribution of Hardy and Littlewood to Waring's problem and similar problems was that they invented a way to prove that if $s\geqq(k-2)2^{k-1}+5$, at most a finite number of coefficients in the above expansion vanish, and hence $G(k)\leqq(k-2)2^{k-1}+5$, and that they found an asymptotic expression for c_n, that is the number of ways n can be expressed as a sum of s kth powers. Later they found smaller bounds for $G(k)$.

Although Hardy and Littlewood proved that every sufficiently large integer is a sum of 19 fourth powers, 41 fifth powers, $\cdots$, 425 eighth powers, etc., they did not compute actual limits beyond which these facts would hold true. Hence their work gave no immediate information about the size of Waring's constant $g(k)$. In the hope of being able to prove Waring's original statement with the best possible values $g(k)$, L. E. Dickson urged certain of his students about 1930 to find lower limits to the constants in the Hardy-Littlewood analysis. R. D. James succeeded in this, and proved $g(6)\leqq183$, $g(7)\leqq322$, $g(8)\leqq595$, in 1934; but the limits given by the Hardy-Littlewood method soon became impracticable.

The next and most important step came from the great Russian mathematician, I. M. Vinogradow. Vinogradow's earlier researches on the Waring problem had appeared in 1924; his methods were similar to those of Hardy and Littlewood, but led more rapidly to certain results. In his later work he made very important improvements, and found results which for large k were much better than those previously obtained. In particular, he ultimately proved $G(k)\leqq k(3\log k+10)$.

With the appearance of Vinogradow's new results, L. E. Dickson in the U.S. and S. S. Pillai in India investigated the possibility of proving the Waring conjecture in the original sense with best possible values $g(k)$, and both arrived independently in 1936 at an "almost complete" solution. Let $q=[(\frac{3}{2})^k]$. They proved that $g(k)=2^k+q-2$ if $k\geqq7$, and

$$(\tfrac{3}{2})^k-q\leqq1-(\tfrac{1}{2})^k\ (q+3). \qquad (1)$$

This condition is satisfied if $k\leqq400$, and possibly for every k. When (1) does not hold, the formula for $g(k)$ is different, but was determined except for those values k (if any) satisfying

$$(\tfrac{3}{2})^k-q=1-(\tfrac{1}{2})^k\ (q+2). \qquad (2)$$

The exceptional case (2) was finally solved in 1944 by I. Niven. Further, (although his proof may require minor corrections) Pillai proved that $g(6)=73$ in 1940. Accordingly, Waring's problem was completed (1944) as regards $g(k)$, except when $k=4$ and 5.

The best results for these cases were those of Dickson (1933) that $19\leqq g(4)\leqq35$, $37\leqq g(5)\leqq54$; and Davenport (1942 and 1939), that $G(5)\leqq23$ and $G(4)=16$. The latter is a best possible result, since the infinitely many numbers $16^h\cdot31$ require 16 fourth powers. It was, up to 1944, the only best possible result known for $G(k)$, $k\geqq3$.

In 1909 (except for an omission supplied by A. Kempner in 1912) A. Wieferich proved that $g(3)=9$. In the same year Edmund Landau showed that $G(3)\leqq8$. In 1944 U. V. Linnik gave a proof (a lacuna being later filled) that $G(3)\leqq7$. Dickson proved in 1939 that every number except 23 and 239 is a sum of eight cubes.

Numerous generalizations of the Waring problem have been investigated, such as sums of kth powers of primes, integral-valued polynomials, etc.

15. The Goldbach Problem. In an exchange of letters (1742) between Euler and C. Goldbach, it was conjectured that every integer is a sum of three primes, and every even integer a sum of two primes. Not considering 1 as prime, and omitting the even prime 2, we may formulate these conjectures for odd integers $\geqq9$ and even integers $\geqq6$.

No essential progress was made in solving this problem until the result (1923) of Hardy and Littlewood (see section 11) based on the G.R.H. In 1930, L. Schnirelmann proved that every positive integer can be represented by a sum of at most 800,000 primes. This number was lowered to 2,208 by N. P. Romanoff in 1935; to 71 by Heilbronn, Landau, and H. F. Scherk in 1936; to 67 by G. Ricci in 1937. Supplementing the analytic methods of Hardy and Littlewood by powerful new methods of his own, Vinogradow proved that every sufficiently large odd number is a sum of three odd primes, in 1937. In the first award of the Stalin prizes in 1941, Vinogradow received a first prize of 100,000 rubles for his work on the Goldbach problem.

DIOPHANTINE APPROXIMATION

16. Geometry of Numbers.—A *lattice* (in the plane) is the configuration formed by two systems of equidistant parallel lines. The points of intersection form a *point-lattice*. A lattice L can be defined analytically by two linear forms with real coefficients and integer variables: if x and y take all integral values, the points with rectangular co-ordinates $(\alpha x+\beta y,\ \gamma x+\delta y)$, where $\alpha,\beta,\gamma,\delta$ are given real numbers, form a point-lattice. The four points $O=(0,0)$, $P=(\alpha,\gamma)$, $Q=(\beta,\delta)$, $R=(\alpha+\beta,\ \gamma+\delta)$ are the vertexes of a "fundamental parallelogram," of area $\Delta=\alpha\delta-\beta\gamma$ (which we assume not zero). In particular, if $\alpha=\delta=1$, $\beta=\gamma=0$, the lattice consists of all points (x, y) with integral co-ordinates. Any linear transformation $x=ax'+by'$, $y=cx'+dy'$, where a, b, c, d are integers and $ad-bc=+1$, produces a different system of parallelograms based on the same point-lattice. The lattices so derived are said to be *equivalent*. The area Δ of a fundamental parallelogram is the same for equivalent lattices.

Consider a parallelogram with centre at O, and with two lattice-points. P_1 and Q_1 of L as midpoints of adjacent sides. Let the area of the parallelogram be $4k$. If $k=\Delta$ (which is least possible), there are at least 8 points of L on the boundary, but none (except O) in the interior of the parallelogram. This fact is a special case of a famous theorem of Minkowski, which asserts that any simple, closed, convex region R symmetrical about O, and of area greater than 4Δ, contains within it points of L other than O. The reader may think of R as the interior either of a parallelogram or ellipse. This theorem can be extended to n dimensions.

Other important theorems of Minkowski (some of the proofs of which use the above theorem on convex bodies) concern sets of n linear forms $\xi_i=\alpha_{i1}x_1+\ldots+\alpha_{in}x_n$ $(i=1,\ \ldots,\ n)$, with real coefficients α_{ij} and n integral variables $x_1,\ \ldots,\ x_n$. Supposing, for simplicity that $n=2$, we have $\xi=\alpha x+\beta y$, $\eta=\gamma x+\delta y$. Let D denote the absolute value of the determinant $\alpha\delta-\beta\gamma$, and assume $D\neq0$. One theorem asserts that there exist integers x and y not both zero, such that $|\xi\eta|\leqq\frac{D}{\sqrt{5}}$. A second theorem states that if b and c are positive numbers such that $bc\geqq D$ (*e.g.*, if $b=c=\sqrt{D}$), then there exist integers x and y not both zero such that $|\xi|\leqq b$ and $|\eta|\leqq c$. Both these theorems extend to n dimensions. A third theorem asserts that if ρ and σ are given real numbers, we can find integers x and y such that

$$|(\alpha x+\beta y-\rho)(\gamma x+\delta y-\sigma)|\leqq\tfrac{1}{4}D.$$

The obvious extension to n linear forms would have $\frac{D}{2^n}$ on the right. The case $n=3$ was proved by R. Remak in 1923, but the cases $n\geqq4$ had up to 1945 defied attempts at proof. The case $n=4$ was proved by F. J. Dyson in 1948.

After 1938, powerful methods of investigating certain non-convex regions were developed by L. J. Mordell, H. Davenport and K. Mahler.

17. Diophantine Approximation.—The literature on the approximation of irrational numbers by rational fractions is very extensive.

We saw, by continued fractions (section 9), that if θ is any irrational number, there are infinitely many rational fractions $\frac{p}{q}$ such that $|\theta-\frac{p}{q}|<\frac{1}{q^2}$. A different proof (based on Dirichlet's principle that if $n+1$ objects are in n boxes, then at least one box contains two or more objects) is worth giving, because it extends easily to n-dimensional problems. Let (x) denote $x-[x]$; *i.e.*, the fractional part of x. The $Q+1$ numbers (0), (θ), (2θ), $\ldots$, $(Q\theta)$ define $Q+1$ points distributed among the Q intervals 0 to $\frac{1}{Q}$, $\frac{1}{Q}$ to $\frac{2}{Q}$, $\ldots$, $\frac{(Q-1)}{Q}$ to 1. At least one interval must contain two numbers, say $(q_1\theta)=q_1\theta-p_1$, $(q_2\theta)=q_2\theta-p_2$, where p_1, p_2, q_1, q_2 are integers, and $0\leqq q_1<q_2\leqq Q$. Hence $p=p_2-p_1$ and $q=q_2-q_1$ satisfy $|q\theta-p|<\frac{1}{Q}$, $|\theta-\frac{p}{q}|<\frac{1}{qQ}\leqq\frac{1}{q^2}$. If θ is irrational, there will be a larger Q_1 such that $|q\theta-p|>\frac{1}{Q_1}$, and new approximations can be determined by means of Q_1. An extension of this argument proves the following result of Dirichlet. If $\theta_1, \theta_2, \cdots, \theta_k$ are any real numbers, then one can find integers $p_1, \cdots, p_k$, and q such that $|\frac{p_i}{q}-\theta_i|<\frac{1}{q^{1+\frac{1}{k}}}$, $(i=1, \cdots, k)$; if at least one θ_i is irrational there are infinitely many solutions p_i and q.

In 1884 L. Kronecker proved that if θ is any irrational number there are integers n such that $(n\theta)$ is as near as we please to any number in the interval 0 to 1; briefly, $(n\theta)$ is dense on the interval $(0, 1)$. Moreover, as proved about 1912, this distribution is uniform over the interval $(0, 1)$; *i.e.*, if I denotes a subinterval of $(0, 1)$ of length I_1, and if n_I of the points (θ), (2θ), $\cdots$, $(n\theta)$ fall in I, then $\frac{n_I}{n}\to I_1$, as $n\to\infty$. In *Mathematische Annalen*, 77(1916), Weyl proved that a necessary and sufficient condition for the uniform distribution of the numbers $(f(n))$, $n=1, 2, 3, \cdots$, is that

$$\frac{1}{n}\sum_{k=1}^{n}e^{2\pi ihf(k)}\to 0 \text{ as } n\to\infty,$$

for every integer h.

17a. Transcendental Numbers.—Any real number which is not algebraic (*cf.* section 18) is called *transcendental*. Interest in transcendental numbers perhaps first arose in connection with the classical problem of "squaring the circle," which could be performed by Euclidean constructions if and only if the number π were expressible by means of square roots and rational operations. The impossibility of this construction was therefore demonstrated when F. Lindemann proved the transcendence of π in 1882.

Liouville proved a theorem which shows how to obtain as many transcendental numbers as we please (1851). It states that if ξ is a real algebraic number of degree n and K is any constant, then there exist at most a finite number of rational fractions $\frac{p}{q}$ such that $|\frac{p}{q}-\xi|<\frac{K}{q^{n+1}}$. Hence a number with a sufficiently rapid sequence of rational approximations is transcendental (*e.g.*, this is true of $.101001000010\cdots$)

Among the numbers known to be transcendental we may mention e, π, $\log_e 2$, $2^{\sqrt{3}}$, e^{π}. In 1900, Hilbert proposed the problem of proving that if α and β are algebraic numbers, α not 0 or 1, and β is irrational, then α^β is transcendental. This was proved in 1934 by Alexis Gelfond and T. Schneider, independently, by different methods.

GENERALIZATIONS OF ARITHMETIC

18. Algebraic Numbers.—Gauss was the first to extend the notions of arithmetic (integrality, divisibility, primality, etc.) to systems other than the ordinary integers. He defined a complex number $a=a_0+a_1i$ (where a_0, a_1 are rational numbers and $i^2=-1$) to be a *complex integer* if a_0 and a_1 are ordinary integers. Ordinary integers will hereafter be called *rational integers*. Divisibility is defined as usual: $b|a$ if $a=bc$ in complex integers. The number a_0-a_1i, called the conjugate of a, may be designated by a'. The product aa' is the rational integer $a_0^2+a_1^2$, and is called the *norm of a*. If $a=bc$, then $a'=b'c'$, $aa'=(bb')(cc')$, so that the norm of b is a factor (in the ordinary sense) of the norm of a. The only complex integers which divide all complex integers are those of norm 1, the *units* ± 1 and $\pm i$. If $b|a$ then the associates ub of b, where u is any unit, are also factors of a. If the complex integer p (not a unit) has no factors other than its associates and units, p is called a *prime*. It turns out that $p=p_0+p_1i$ is a complex prime if the norm of p is a rational prime of the form $4n+1$, or if $p=\pm(1\pm i)$, or if p is the associate of an ordinary prime of the form $4n+3$. One proves that $p|ab$ only if $p|a$ or $p|b$, and deduces the fundamental theorem of arithmetic (section 1) in the system of complex integers. Virtually all the theorems of ordinary theory of numbers have analogues among complex integers.

E. E. Kummer, in studying Fermat's equation $x^n+y^n=z^n$ (*See* FERMAT'S LAST THEOREM), developed the theory of integral elements in the fields generated by nth roots of unity (Gauss's case is $n=4$), and found to his astonishment, about 1847, that the fundamental theorem of arithmetic does not always hold true in such systems.

To illustrate this, consider the system of numbers $a=a_0+a_1\theta$, where $\theta^2=-5$ and the a_i are rational numbers; a is called integral if the a_i are rational integers. The conjugate a' is now $a_0-a_1\theta$ and the norm of a is $aa'=a_0^2+5a_1^2$. As before, if $b|a$, then the norm of b divides the norm of a. Hence the units (of norm 1) are ± 1. The number $1+\theta$ (of norm 6) must be a "prime," since neither 2 nor 3 are norms. This prime $1+\theta$ is a divisor of $(1+\theta)(6+5\theta)=-19+11\theta=(-1+3\theta)(4+\theta)$. But $1+\theta$ is not a divisor of $4+\theta$, since the norm 6 does not divide the norm 21. Hence the fundamental theorem of arithmetic (with many of its consequences) does not hold.

If θ is a real or complex solution of an algebraic equation of the type $a_0x^n+a_1x^{n-1}+\ldots+a_n=0$, where the coefficients a_i are rational numbers, θ is called an *algebraic number*. It is called an *algebraic integer* if it satisfies such an equation with $a_0=1$, and $a_1, \ldots, a_n$ integers. Examples are i and $\sqrt[3]{6}$. One frequently considers the algebraic integers in a given algebraic field, which consists of all numbers of the form $b_0+b_1\theta+b_2\theta^2+\ldots+b_r\theta^r$ with rational coefficients b_i. The sum, difference, and product of two algebraic integers in a field are easily seen to be algebraic integers in the same field.

19. Ideals. Suppose that S is the system of all algebraic integers, denoted by $a, b, \ldots, s, t$ in a given algebraic field. Divisibility, units, associates, etc. are defined much as in the preceding two examples. Factorization into primes may not be unique. However, by adjoining to the system S a set of *ideals*, presently to be defined, the fundamental theorem of arithmetic can be made to hold.

If $a=bc$, then clearly the set of all multiples sa of a (where s ranges over all the integral elements of S) is included in the set of all multiples sb of b. Thus the notion of divisibility of integers can be replaced by the notion of inclusion of one set in another. The set of all multiples sa of a given number a will be called an *ideal*, more specifically, a *principal ideal*. More generally, an *ideal* is a set of numbers in an algebraic field, such that if u and v are any numbers in the set then $su+tv$ are in the set, where s and t range over all the integers of the field. In the case of rational integers, if u and v are any rational integers not both zero, then the set of numbers $su+tv$ is the same as the set of numbers md, where d is the g.c.d. of u and v; hence every ideal is then principal. The same is true in Gauss's case of numbers a_0+a_1i. But the field

generated from $\theta^2=-5$ contains nonprincipal ideals.

The product of two ideals is the ideal obtained by multiplying each element of one by each element of the other, and then constructing all combinations $su+tv$ (s and t integral, u and v in the ideal). The principal ideal consisting of all multiples sa of a will be denoted by (a); the ideal consisting of all combinations $su+tv$ by (u, v). It can be shown that every ideal in an algebraic field can be expressed in this way by one or two terms. The ideal (1) plays the role of the number 1; *i.e.*, for any ideal α, $(1)\ \alpha=\alpha$. An ideal whose elements are algebraic integers is called *integral*. A *prime ideal* is an integral ideal with no divisors except itself and (1). The fundamental theorem of arithmetic can be shown to hold in an algebraic field, if each algebraic integer a is replaced by its principal ideal (a), and the system is enlarged to encompass all the integral ideals of the field: every ideal which is not a prime can be expressed as a product of prime ideals in one and only one way.

This may be illustrated in the above example with $\theta^2=-5$ as follows. Let $\alpha=(1+\theta,\ -1+3\theta)$, $\beta=(1+\theta,\ 4+\theta)$, $\gamma=(6+5\theta,\ -1+3\theta)$, $\delta=(6+5\theta,\ 4+\theta)$. The ideals $\alpha, \beta, \gamma, \delta$ are easily shown to be prime ideals (of respective "norms" 2, 3, 23, and 7), and the factorization of $(-19+11\theta)$ into prime ideals is simply $\alpha\beta\gamma\delta$. The factorizations previously given were $\alpha\beta.\gamma\delta=(-19+11\theta)=\alpha\gamma.\beta\delta$, and it is not surprising that $\alpha\beta|\alpha\gamma.\beta\delta$ without dividing $\alpha\gamma$ or $\beta\delta$.

20. Algebras, and Their Arithmetics. Other generalizations of number are found in the extensive theory of linear algebras, which we will illustrate only very briefly. A simple example is the algebra of quaternions (*see* QUATERNIONS). These are symbols of the form $a=a_0.1+a_1i_1+a_2i_2+a_3i_3$, where we will suppose the a_i to be rational numbers, and the basal elements $1, i_1, i_2, i_3$ satisfy the multiplication table $1.b=b.1=b, i_1^2=i_2^2=i_3^2=-1$, $i_1i_2=i_3=-i_2i_1$, $i_2i_3=i_1=-i_3i_2$, $i_3i_1=i_2=-i_1i_3$. Algebraic operations are performed in the usual way, except that multiplication is in general not commutative (*e.g.*, $i_1i_2\neq i_2i_1$), and the order of multiplication must be preserved. The resulting algebra has many applications, physical and geometrical. The question here is, what shall be meant by an integral quaternion?

In 1886, R. Lipschitz defined a to be integral if the co-ordinates a_i are rational integers, and was able to prove the following result resembling the fundamental theorem of arithmetic. Define a', the *conjugate of* a, to be $a_0-a_1i_1-a_2i_2-a_3i_3$. The product aa' will be found to be $a_0^2+a_1^2+a_2^2+a_3^2$, a rational integer called the *norm of* a, abbreviated $N(a)$. From $a=bc$ follows $a'=c'b'$, and hence $aa'=(bc)(c'b')=b(cc')b'=(bb')(cc')$, or $N(a)=N(b)N(c)$. The units are the eight quaternions $u=\pm 1, \pm i_1, \pm i_2, \pm i_3$ of norm 1. If b is a left-divisor of a(*i.e.*, $a=bc$ in integral quaternions), then the right-associates bu are also left-divisors of a. A *prime quaternion* is an integral quaternion a (not a unit) such that if $a=bc$ in integral quaternions, then b or c is a unit. It is easily proved that a quaternion is prime if and only if its norm is a rational prime number; *e.g.* $1+i_1$ of norm 2, $2+i_1-2i_2+2i_3$ of norm 13. Factorization into primes is in general not unique. For example, $3=(1+i_1+i_2)(1-i_1-i_2)=(1+i_1+i_3)(1-i_1-i_3)$, yet the primes $1+i_1+i_2$ and $1+i_1+i_3$ are not right-associates. However, suppose now that a is primitive, *i.e.* that a_0, a_1, a_2, a_3 are relative-prime, and that $N(a)$ is not divisible by 4. Factor $N(a)=p_1p_2\ldots p_r$ into rational primes, not necessarily distinct, but in a definite order. Lipschitz's result is this: there exist prime quaternions $t_1, t_2, \ldots, t_r$ of respective norms $p_1, p_2, \ldots, p_r$ such that $a=t_1t_2\ldots t_r$; this factorization into primes is unique, for the given order of $p_1, \ldots, p_r$, except that we can introduce unit factors in the trivial way illustrated by $t_1t_2t_3=(t_1i_1)\ (-i_1t_2i_3)\ (-i_3t_3)$. This theorem of Lipschitz yields a large number of arithmetical applications; *e.g.*, he proved thereby the formula for the number of representations of integers as a sum of four squares (section 7).

However, the definition of integral quaternion was somewhat arbitrary. A. Hurwitz was led by natural considerations to define a to be integral if the a_i are either all integers, or all halves of odd integers. For example, $\frac{1}{2}(1+i_1-i_2+i_3)$ is integral, of norm 1. The resulting arithmetic is better behaved with respect to the prime 2 (it being unnecessary to restrict $N(a)$ to be not divisible by 4,—but still necessary to assume a primitive.)

We owe, finally, to L. E. Dickson an adequate and unique characterization of a system of integral elements in any linear algebra (*Algebras and Their Arithmetics* [1923]). This includes Hurwitz's system and the theory of algebraic integers as special cases, and has formed the basis of much subsequent work.

The first half of the 20th century saw many extensions of the theory of numbers to various algebraic systems. Not all theorems extend easily, and some lead to rather surprising results. The prospects for original research were, by mid-20th century, by no means exhausted.

NUMBER SEQUENCES. A number sequence is a set of numbers arranged in some order so that for each pair of numbers of the set it is determined which one of the pair precedes the other. The simplest kind of example is a finite sequence, such as 9, 15, 7, 2, $\frac{3}{2}$, where the order of precedence is from left to right. A different sequence is obtained from the same set of numbers by rearrangement, as, for example, 15, 2, 7, 9, $\frac{3}{2}$. The term infinite sequence usually refers to an unending succession of numbers, such that after each one appears a next following, as, for example, $1, 4, 9, 16, \ldots, n^2, \ldots$. Such an infinite sequence is a function of a variable ranging over the positive integers and is sometimes called a simple infinite sequence. It is frequently convenient to allow repetitions in such a sequence. Other types of sequences are sometimes useful in mathematics, as, for example, the rational numbers in their usual order. (*See* also NUMBER: *Infinite Ordinal Numbers*.) A double infinite sequence is a function of two variables each ranging over the positive integers. It may be thought of as a set of numbers arranged in a rectangular array instead of in a line. Thus, a double sequence is not an instance of the definition given at the beginning of this article but requires an extension of that definition.

Types of Simple Sequences.—These include arithmetic progressions, harmonic progressions and geometric progressions. An

arithmetic progression is a sequence such that the difference of two successive terms of the sequence is always the same number, d. If the first term is a, then an arithmetic progression may be written in the form

$$a,\ a+d,\ a+2d,\ a+3d,\ \cdots.$$

It may be shown by mathematical induction that the nth term of the sequence is given by the formula $a+d(n-1)$, and the sum of the first n terms by the formula

$$\tfrac{1}{2}n[2a+(n-1)d].$$

A harmonic progression is a sequence the reciprocals of whose terms form an arithmetic progression. A geometric progression is a sequence such that the ratio of two successive terms is always the same number $r(\neq 1)$. If the first term is a, then a geometric progression may be written in the form

$$a,\ ar,\ ar^2,\ ar^3,\ \cdots.$$

The nth term is ar^{n-1}, and the sum of the first n terms is given by the formula

$$\frac{a(1-r^n)}{1-r}.$$

These formulas are readily proved by mathematical induction. If r is numerically less than one, the expression for the sum of the first n terms approaches $\dfrac{a}{(1-r)}$ when n increases without limit. In this case $\dfrac{a}{(1-r)}$ is called the sum of the infinite geometric progression or geometric series

$$a+ar+ar^2+\cdots+ar^{n-1}+\cdots.$$

Definition of Irrational Numbers.—Simple infinite sequences of rational numbers may be used to define irrational numbers. For example, $\sqrt{2}$ may be defined by the decimal sequence 1, 1.4, 1.41, 1.414, $\cdots$, whose successive terms may be determined by any one of the customary methods of computing square roots. A sequence $a_1, a_2, a_3, \cdots, a_n, \cdots$ to be used in defining a number must be a regular sequence, in the sense that to every positive number ϵ there corresponds an integer n such that the numerical value of $a_m - a_n$ is less than ϵ whenever m is greater than n. Two regular sequences $a_1, a_2, a_3, \cdots$ and $b_1, b_2, b_3, \cdots$ define the same number when $a_n - b_n$ approaches zero as n becomes infinite. Algebraic operations on regular sequences are readily defined. This method of constructing the real-number system by the use of regular sequences of rational numbers is due to G. Cantor (*Math. Annalen*, vol. v [1872] and vol. xxi [1883].) It is found that regular sequences of real numbers always have real numbers as limits so that no further extension of the number system in this direction is necessary.

Solutions of Equations.—Infinite sequences appear in Sir Isaac Newton's method of finding solutions of numerical equations. Thus, if a_1 is sufficiently close to a root of an equation $f(x)=0$, the formula

$$a_2 = a_1 - \frac{f(a_1)}{f'(a_1)},$$

where $f'(x)$ is the derivative of $f(x)$, gives a closer approximation. Repeated use of this formula gives a sequence $a_1, a_2, a_3, \cdots$, of closer and closer approximations to the desired root. This sequence may be proved to be regular in accordance with the definition given above. A similar method may be employed to approximate solutions of differential equations (*q.v.*), but in this case sequences of functions appear in place of number sequences.

Summability of Infinite Series.—The term infinite series is frequently applied to the indicated sum of the terms of an infinite sequence $a_1, a_2, a_3, \cdots$ when one wishes to consider the existence and value of the limit as n approaches infinity of the related sequence $s_1=a_1$, $s_2=a_1+a_2$, $s_3=a_1+a_2+a_3$, $\cdots$. When this limit exists and is finite, the infinite series is said to converge. In the consideration of infinite series which do not converge, various methods of summation have been invented which associate with the series other sequences than the sequence $s_1, s_2, s_3, \cdots$ defined above. For example, E. Cesàro considered the sequence $t_1=s_1$, $t_2=\dfrac{(s_1+s_2)}{2}$; $t_3=\dfrac{(s_1+s_2+s_3)}{3}\cdots$. This sequence may have a limit when the sequence $s_1, s_2, s_3, \cdots$ does not; but when the latter does have a limit, the former always has the same limit.

In the study of functions by the use of associated infinite series of functions, the series may fail to converge for some values of the independent variable. In some cases of this sort the value of the function may still be recovered from the series by use of a suitable method of summation.

NUMENIUS, a Greek philosopher, of Apamea in Syria, Neopythagorean and forerunner of the Neoplatonists, flourished during the latter half of the 2nd century A.D. His chief divergence from Plato is the distinction between the "first god" and the "demiurge." This is probably because of the influence of the Valentinian Gnostics and the Jewish-Alexandrian philosophers (especially Philo and his theory of the Logos). His works were valued by the Neoplatonists, and it is said Amelius wrote about 100 books of commentaries on them.

Fragments of his treatises on the points of divergence between the Academicians and Plato, on the Good (in which according to Origen, *Contra Celsum*, iv, 51, he makes allusion to Christ) and on the mystical sayings in Plato are preserved in the *Praeparatio Evangelica* of Eusebius.

The fragments are collected in F. G. Mullach, *Frag. phil. Graec.*, iii; *see* also F Thedinga, *De Numenio philosopho Platonico* (Bonn, 1875); Ritter and Preller, *Hist. Phil. Graecae*, ed. by E. Wellmann (1898), T. Whittaker, *The Neo-Platonists* (1901; 2nd ed., 1918) and Überweg, *Grundriss der Gesch. der Philosophie*, Bd. I (1926).

NUMERALS. Just as the first attempts at writing came long after the development of speech, so the first efforts at the graphical representation of numbers came long after people had learned to count. Judging by the habits of primitive tribes of the present as well as by the oldest trace that we have of written or sculptured records, the earliest numerals were simple notches in a stick, scratches on a stone, marks on a piece of pottery or the like.

Having no fixed units of measure, no coins, no commerce beyond the rudest barter, no system of taxation and no needs beyond those of a savage, there was no necessity for written numerals until about the beginning of what we call historical times.

Early Forms.—The earliest numerals of which we have definite record were simply straight marks for the small numbers, with some special form for ten. These symbols appear in Egypt as early as the 1st dynasty (*c.* 3400 B.C.), and in Mesopotamia as early as *c.* 3000 B.C. These dates long precede the first known inscriptions containing numerals in India (*c.* 3rd century B.C.), in China (3rd century B.C.) and in Crete (*c.* 1200 B.C.).

Egyptian hieroglyphic, *c.* 3400 B.C. . . . . 

Egyptian hieratic, *c.* 3400 B.C. . . . . 

Cretan inscriptions, *c.* 1200 B.C. . . . . 

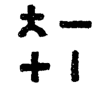
Sumerian and later, *c.* 3000 B.C. . . . . 

Somewhat later it is not uncommon to find a group mark before ten is reached. For example, four has a special symbol in certain Hindu types, as follows:

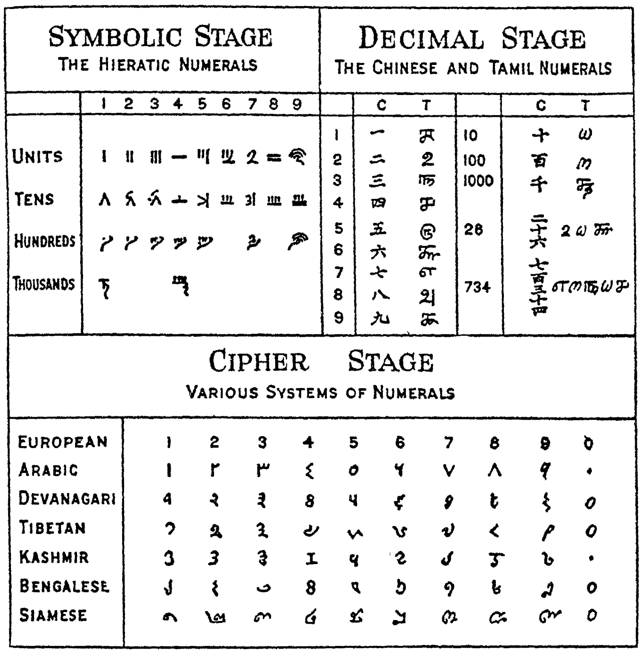
Asoka's time, 3rd century B.C. . . . . . . 
Nānā Ghāt, 2nd century B.C. . . . . 

Saka, *c.* 1st century B.C. . . . . 

Nasik, 1st or 2nd century . . . .
Kuṣana, *c.* 150 . . . .



Early Hindu Symbols for 1 and 4.—Even to-day a Chinese merchant may write one and four in the forms I and X respectively, instead of using the classical symbol. This use of a symbol for four may, in fact, have preceded the Western habit of taking



THE DEVELOPMENT OF NUMERALS THROUGH THE SYMBOLIC, DECIMAL AND CIPHER STAGES

ten as the first group number, and the Etruscan and Roman use of V or Λ for five may have been a hand symbol in use before the X was taken for ten.

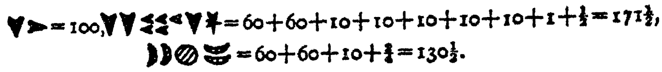
The vertical marks, I, II, III, etc., may possibly be representations of the fingers held as used in counting and computing, a linguistic trace of which is found in the word *digit*. The horizontal marks may be representations of computing rods as they lie on a table. The vertical symbols were preferred in Mesopotamia and the Mediterranean region, and the horizontal ones in the Far East, where —, =, and ≡ were commonly used for one, two, and three, = and ≡ being cursively written to give us our present 2 and 3.

It therefore appears that the primitive numerals were I, II, III, IIII, and so on, as we find in Egypt and the Grecian lands, or —, =, ≡, and probably so on as we usually find in the East, each going as far as the simple needs of people required. The idea of a group figure would naturally have occurred to merchants as soon as there developed a need for numbers beyond 10 or 12 (as was the case in Egypt and Babylon). Once the idea was suggested, probably influenced by the ten fingers, symbols were invented for smaller units, as in the case of those used for four and five as stated above. These naturally suggested special symbols for each of the numbers from one to ten or even farther, and the use of the additive principle to build up larger numbers, as in the Roman XXII. The idea of special symbols for larger groups, as for 20, 30, and so on, was a natural extension.

Cuneiform Numerals.—Around Babylon, clay was abundant; and in the damp clay tablets they impressed their symbols, then baking these tablets in the sun or in a kiln, thus forming historical documents that were practically as permanent as stone. Since the pressure of the stylus gave a wedge-shaped symbol, the writings are known as cuneiform (Lat. *cuneus*, a wedge, +*forma*, a shape) inscriptions.

For our purposes some leading principles will suffice. The symbol for 1 served also for 60, 3,600, and in general for 1×60^n; similarly the symbol for 10 served for 10×60^n, the context telling what particular value was indicated. The symbols could be made either with the pointed or the circular end of the stylus, as follows:

There was also a symbol for 100, but in general the scribe preferred to make use of the symbol for 60, thus:



Following the general custom of the race to use small numbers instead of large ones, the Babylonians employed a subtractive principle, as we do in saying "a quarter to three" instead of "three quarters past two," and "three minutes to six" instead of "57 minutes after five." This appears in such numerals as

A similar custom is seen in Hebrew number names, in the occasional use of IV. for four and IX. for nine in the Roman inscriptions. The Romans also used *unus de viginti* for 19, and *duo de viginti* for 18, occasionally writing these numbers as XIX. (or IXX.) and IIXX., respectively. On the whole, however, the subtractive principle was little used in the numerals of the classical period.

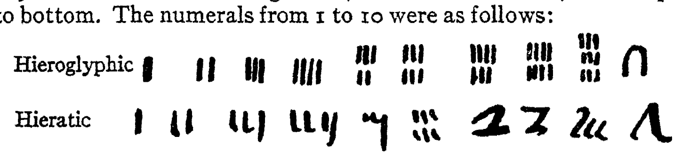
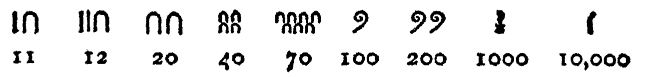
THIRTEENTH CENTURY FINGER SYMBOLISM
From the *Codex Alcobatiensis*, in the Biblioteca Nacional, Madrid

Egyptian Hieroglyphics.—The Egyptian numerals in hieroglyphic writing differed somewhat from those in the hieratic and demotic, but the last two were degenerate forms of the first, with certain additions. It will suffice to call attention to the principles of the first and second. In doing so, however, it should be observed that the Egyptians generally wrote from right to left, as in the Semitic script, but the hieroglyphics were occasionally written from left to right or (as also the Hieratic) from top to bottom. The numerals from 1 to 10 were as follows:

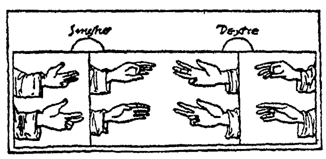


The hieroglyphic symbols for certain larger numbers were as follows:



It will therefore be seen that the general plan of the hieroglyphic notation was to have special symbols for powers of 10, and to repeat these as necessary. The Hieratic had special symbols for 5, 7, 8, and 9—a step toward the later Hindu system. The Hieroglyphic was similar in principle to the Etrusco-Roman, except that the latter introduced special numerals for 5, 50, and 500.

Greek Numerals.—The Greeks had two important systems of numerals, besides the primitive plan of repeating single strokes, as in III III for six. Their predecessors in culture—the Babylonians, Egyptians, and Phoenicians—had generally repeated the units up to nine, with a special symbol for ten, and so on. The early Greeks also repeated the units to nine, and probably had various symbols for ten. In Crete, whose early civilization was so much influenced by that of Phoenicia and Egypt, the symbol for ten was —, a circle was used for 100, and a rhombus for 1,000. Cyprus also used the horizontal bar for ten, but the precise forms



FROM SMITH, "HISTORY OF MATHEMATICS"
FIFTEENTH CENTURY FINGER SYMBOLISM
From *Sūma* of Pacioli, Venice, 1494

are not of so much significance as that the grouping by tens, with special symbols for certain powers of ten, was characteristic of the early systems of the Near East.

The Greeks, entering the field much later, and influenced as to their alphabet by the Phoenicians, based their first elaborate system chiefly on the initial letters of the numeral names. This was a natural thing for all early civilizations, since the custom of writing out the names for large numbers was at first quite general, and the use of an initial by way of abbreviation of a word is universal. These initial numerals, in modern characters, were

Π, *pi*, for ΠΕΝΤΕ (*pente*), five;
Δ, *delta*, for ΔΕΚΑ (*deká*), ten; often written like O;
H, an old Attic breathing, like our *h*, later represented by a special symbol like ', for HEKATON (*hekaton*), hundred;
X, chi, for ΧΙΛΙΟΙ (*chil'ioi*), thousand;
M, *mu*, for ΜΥΡΙΟΙ (*myr'ioi*, *mur'ioi*), ten thousand.

These numerals were frequently combined, thus:

𐅄 or 𐅄, *pente-deka*, for 5×10, or 50;
𐅅, *pente-hekaton*, for 5×100, or 500;
𐅇, *pente-murioi*, for $5 \times 10{,}000$ or 50,000.

This system appears in records of the 3rd century B.C. but was probably used much earlier. In the 2nd century of our era it was described by the grammarian Herodianus, and hence characters are often spoken of as Herodianic numerals. They are more properly called Attic numerals, being the ones always found in the Attic inscriptions.

As early as the 3rd century B.C. another system came into use, running parallel to the initial-letter one, being better adapted to the theory of numbers, and being more difficult of comprehension by the trading class. It consisted in assigning nine letters of the alphabet to the numbers 1–9, nine letters to the numbers 10, 20, 30,..., 90, and nine letters to the numbers 100, 200, 300, ..., 900. Since, however, there were only 24 letters in the Greek alphabet, three were added, namely the Phoenician *vau* (shaped like our letter **F**), *koph* or *qoph* (shaped somewhat like our letter **Q**, which indeed is derived from the same source, and represented below as **Q**), and a character known in modern times as *sampi* (and then shaped somewhat like the Greek π, but tipped about 45° to the right and represented below as **&**). An earlier form of this last symbol was ͳ. The numerical values of the letters were therefore as follows:

Units . .	A	B	Γ	Δ	E	[F]	Z	H	Θ
	1	2	3	4	5	6	7	8	9
Tens . .	I	K	Λ	M	N	Ξ	O	Π	[Q]
	10	20	30	40	50	60	70	80	90
Hundreds .	P	Σ	T	Υ	Φ	X	Ψ	Ω	[&]
	100	200	300	400	500	600	700	800	900

The thousands were often indicated by placing a bar to the left of the numeral, thus:

/A = 1,000 /B = 2,000 /I = 10,000 /Σ = 200,000

The myriads (ΜΥΡΙΟΙ, *myrioi*, ten thousands) were represented by such symbols as

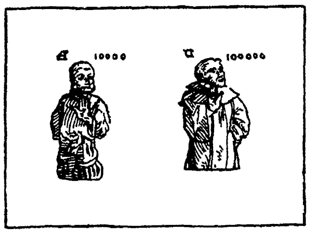
M or $\overset{\Upsilon}{\text{M}}$, for 10,000, $\overset{\Delta}{\text{M}}$ for $4 \times 10{,}000$, or 40,000, etc.

Such numeral forms were not particularly difficult for computing purposes, once the operator was able automatically to recall the meaning of each. To be able to express 10,407 by MΥZ would have seemed to a Greek considerably simpler than by our system. The capital letters were used by the Greeks, the small letters being a relatively modern invention.

Hebrew Numerals.—By the 2nd century B.C. at the latest, the Hebrews had established a system of alphabetic numerals similar to the one used by the Greeks. The alphabet being exhausted when the symbol for 400 was reached, the letters for 400 and 100 were combined by early writers to represent 500, and similarly up to 900. Later scholars used the final forms of the letters for 20, 40, 50, 80 and 90 (that is, the form of the letter that would be used at the end of a word) to represent 500, 600, ..., 900. The scheme then appeared as follows:

Units . . .	א	ב	ג	ד	ה	ו	ז	ח	ט
	1	2	3	4	5	6	7	8	9
Tens . .	י	כ	ל	מ	נ	ס	ע	פ	צ
	10	20	30	40	50	60	70	80	90
Hundreds . .	ק	ר	ש	ת	ך	ם	ן	ף	ץ
	100	200	300	400	500	600	700	800	900

Roman Numerals.—The direct influence of Rome for such a long period, the superiority of her numeral system over any other simple one that had been known in Europe before about the 10th century, and the compelling force of tradition explain the strong position that the system maintained for nearly 2,000 years in commerce, in scientific and theological literature, and in *belles lettres*. It had the great advantage that, for the mass of users, the memorizing of the values of only four letters was necessary—V, X, L, and C. Moreover, it was easier to see three in **III** than in 3, and to see nine in **VIIII** than in 9, and correspondingly easier to add numbers—the simplest of all the operations.



FROM SMITH, "HISTORY OF MATHEMATICS"
SIXTEENTH CENTURY FINGER SYMBOLISM
From the *Abacvs* of Johannes Aventinus, Nurnberg, 1522

As in all such matters, the origin of these numerals is obscure, although the changes in their forms since the 3rd century B.C. are well known. Of the various theories that of Mommsen (1850) has had the widest acceptance. This was that the use of **V** for 5 is due to the fact that it is a kind of hieroglyphic representing the open hand with its five fingers. Two of these gave the **X** for ten. Three of the other symbols, he asserted, were modifications of Greek letters not needed in the Etruscan and early Latin alphabet. These were *chi*, which appears in inscriptions not only as **X** but also in such forms as ⊥, ↓, and which later became the **L** that was arbitrarily chosen for 50; *theta*, Θ, which was selected for 100, being finally changed to C under the influence of the word *centum* (hundred); and *phi*, Φ, to which was assigned the value 1,000, and which finally took the forms (I), and **M**, the last being chosen because of the word *mille* (thousand). There is considerable epigraphical evidence in support of these contentions made by Mommsen. (*See* the bibliography for other theories.)

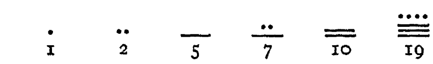
The oldest noteworthy inscription containing numerals representing very large numbers is on the *columna rostrata*, a monument erected in the Roman forum to commemorate the victory of 260 B.C. over the Carthaginians. In this a symbol for 100,000, which was an early form of (((I))), was repeated 23 times, making 2,300,000. This illustrates not only the early Roman use of repeated symbols, but also a custom which extended to modern times—that of using (I) for 1,000, ((I)) for 10,000, (((I))) for 100,000, and ((((I)))) for 1,000,000. The symbol (I) for 1,000 frequently appears in various other forms, including the cursive ∞. All these symbols persisted until long after printing became common. In the middle ages a bar (*vinculum*, *titulus*) was placed over a number to multiply it by 1,000, but this use is not found in the Roman inscriptions. When the bar appears in early manuscripts it was merely for the purpose of distinguishing numerals from nouns, as in the case ĪĪVIR for *duumviri*. We also find in the middle ages such forms as $\overline{|X|}$ or **|X|** for ten hundred thousand and $\overline{|M|}$ for one thousand hundred thousand.

Of the later use of the numerals, a few of the special types are as follows:

(1) $\bar{c}$ · $\overline{\text{lxiiij}}$ · ccc · l · i, for 164,351, Adelard of Bath (*c.* 1120).
(2) II.DCCC.XIIII, for 2,814, Jordanus Nemorarius (*c.* 1125).
(3) MƆCLVI, for 1,656, in San Marco, Venice.
(4) cIↃ.IↃ.Ic, for 1,599, Leyden ed. of Capella, 1599.
(5) IIIIxxet huit, for 88, a Paris treaty of 1388.
(6) four Cli.M, for 451,000, Baker's arithmetic (1568).
(7) vj.C for 600 and CCC.M for 300,000, Recorde (*c.* 1542).

The first represents the use of the vinculum; (2) represents the place value as it occasionally appears in Roman numerals; (3) illustrates the not infrequent use of ɑ (like D, originally half of (I), the symbol for 1,000); (4) illustrates the persistence of the old Roman form for 1,000 and 500, and the subtractive principle so rarely used by the Romans for a number like 99; (5) shows the use of *quatre vingt* for 80, commonly found in French manuscripts until the 17th century, and occasionally later, the numbers often being written like iiij^{xx}, vij^{xx}, and so on; (6) represents the coefficient method, "four C" meaning 400, a method often leading to forms like ijM or **IIM** for 2,000, as shown in (7).

The Maya Use of Place Value.—Evidence of some appreciation of place value is found in various systems of notation. For example, the cuneiform inscriptions contain frequent examples like ɪtʇɪ (using ɪ to represent the vertical wedge and *t* to represent the tens symbol), in which the first ɪ stands for 60 and the last ɪ for one, the number being 81. Similarly the later Roman forms occasionally contain cases like II · CX for 2,110, although these are not examples of the systematic use of place value as we understand it. In Yucatan, however, the highly developed Maya civilization used, for calendar purposes, a system of numerals based upon a scale which has elements of both 5 and 20, the horizontal bar (—) representing 5 and the dot (·) representing unity. The following are examples:



The Mayas also had a symbol for 0 in connection with which the place value clearly appears, as follows:

, 1 twenty and no units

, 15 twenties and no units

, 17×20 and no units (our 340)

The next number after 17×20+19 is 360, which then became a kind of super-radix, as follows:

, 19×360+13×20+13=7,113.

The Maya numerals seem to have been used for writing numbers rather than for calculation.

Chinese Numerals.—The Chinese have three general systems of numerals—the ancient national, the modern national, and the mercantile. These are respectively as follows:

一	二	三	四	五	六	七	八	九	十	百	千
一	二	三	四	五	六	七	八	九	十	百	千
〡	〢	〣	〤	〥	〦	〧	〨	〩	十	百	千

The second differs from the first in that the place value is used, the circle ○ being used for our zero. The date 1937 is here shown in the two systems, the numbers being written downwards, as usual.

Modern	Traditional
一 九 三 七	千 九 百 三 十 七

Sanskrit and Arabic Numerals.—By way of comparison of the modern Sanskrit and Arabic forms, the two are here shown:

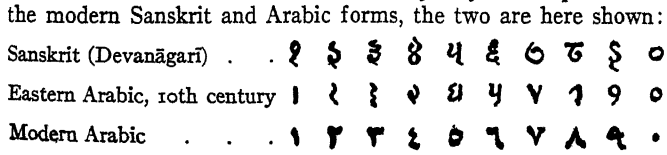


Table of Changes of the Hindu-Arabic Numerals in Europe
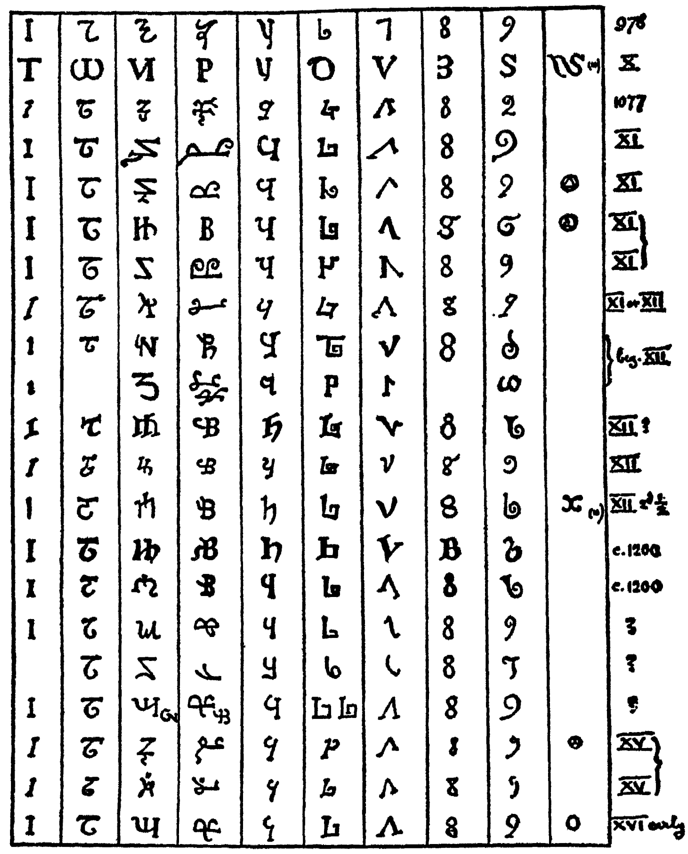
From G. F. Hill's *The Development of Numerals in Europe*, Oxford, 1915
Reproduced by permission of the author and the Oxford University Press



Our Common Numerals.—Several different claims, each having a certain amount of justification, have been made with respect to the origin of our present numerals, commonly spoken of as Arabic but preferably as Hindu-Arabic. These include the assertion that the origin is to be found among the Arabs, the Persians, the Egyptians, and the Hindus. It is not improbable that the intercourse between traders served to carry such symbols from country to country, so that our numerals may be a conglomeration from different sources. The country, however, which first used, so far as we know, the largest number of our numeral forms is India. The 1, 4, and 6 are found in the Aśoka inscriptions (3rd century B.C.); the 2, 4, 6, 7, and 9 appear in the Nānā Ghāt inscriptions about a century later; and the 2, 3, 4, 5, 6, 7, and 9, in the Nasik caves of the 1st or 2nd century of our era—all in forms that have considerable resemblance to our own, our 2 and 3 being well-recognized cursive derivations from the ancient = and ≡. None of these early Indian inscriptions gives any evidence of place value, or of a zero that would make our place value possible. Hindu literature gives some evidence that the zero may have been known before our era, but we have no actual inscription containing such a symbol before the 9th century.

The first definite external reference to the Hindu numerals is in a note by Severus Sebokht, a bishop who lived in Mesopotamia *c.* 650. Since he speaks of "nine signs," the zero seems not to have been known to him. By the close of the 8th century, however, some astronomical tables of India are said to have been translated into Arabic at Baghdad, and in any case the numerals became known to Arabic scholars about this time. About 825 al-Khowârizmî wrote a small book upon the subject, and this was translated into Latin by Adelard of Bath (*c.* 1120) under the title of *Liber Algorismi de numero Indorum*. There is some reason for believing that the numerals found their way into Europe even earlier than into Baghdad, but the earliest European

manuscript that is known to contain them was written in Spain in 976. The table on preceding page shows their subsequent development until the time of printing.

NUMERAL SYSTEMS. There is no language without some numerals; the notion of unity and plurality is expressed at least in the formation of "one" and "two," though "two" is often equal to "much," thus concluding a numeration that has just only started. It is doubtful whether even systemless numeration really exists, as it is mostly reported of peoples who are but vaguely known. The eastern languages of Australia, in spite of the occurrence of numerals for "three" and even "four," and in a less degree the western languages, Yuin-Kuri, Wiradhuri, Kamilaroi, and the southern central languages have been suspected of it. It remains doubtful whether Tasmania practised systemless or pair numeration. The Pygmies of the Andaman islands and Malacca form numerals for "one" and "two," yet sum up only with units, not with pairs. So with the Chiquito in South America.

The Pair System.—The pair system has numerals for "one" and "two" and forms the following numerals by addition to the "pair": $3=2+1$, $4=2+2$, $5=2+2+1$, etc. It is found in Australia among tribes ethnologically the oldest—the Kulin-Kurnai of the south-east, the Narrinyeri of the south; several of them count up to "ten" in this manner. A pure pair system still occurs in many Papuan languages of Torres straits and the adjacent coast of New Guinea. In Africa it is practised by the Bushmen. In South America it is found among the ethnologically oldest tribes—the Fuegian tribes: Yamana and Halakwulup, the Guayaki and Shipaya, and the Ges-Tapuya tribes.

The pair system starts from the parts of the human body that exist in pairs, like eyes, ears, hands, feet. The pair system is also found in various associations with later numeration systems. The formation of a dual with the personal pronoun (and substantive) can be traced back to those times.

The Quaternary System.—The quaternary system forms the numerals above "four" by composition: $5=4+1$, $7=4+3$, $8=4+4$ (or 2×4), $9=(2\times4)+1$, $16=4\times4$. In this consequent type, however, it is but seldom met, *e.g.,* in California with the Salina and traces of it with the Chumash. In California the four quarters of the sky play an important part in religion, mythology and custom.

The Hexad System (Senary System).—When further developed to a duodecimal system this is the most useful of all as it permits of more divisions without fractional numbers than any other system, and in later stages it has been repeatedly introduced especially for astronomy or in metrical or monetary systems. In primitive numeration it has a rather limited dispersion in north-west Africa, *e.g.,* in the Huka, the Bulanda, the Apko; traces of it are to be met with among the Bube on Fernando Po.

The Quinary System.—The quinary system in its pure form, where for instance $10=2$ hands, $25=5$ hands, is found only in Saraweka, a South American Arowak language. Everywhere else it is combined either with the decimal or the vigesimal system.

The Vigesimal System.—The vigesimal system takes 20 as a basis, so as to make 20×20 the numeral next in height, if the numeration goes as far as that. It may combine either with the quinary system forming a quinary vigesimal system or more rarely and only in younger forms with the decimal system, and then becomes a decimal vigesimal system. The quinary vigesimal system is frequently combined with the pair system, so that the numbers 3 and 4, often also 6, 7, 8, 9, and further 12 and 13, are formed according to the pair system.

These systems start with the fingers and the toes. Therefore "five" often means "hand," "ten" means "the two hands," 11 "one at the foot." 20 "both the feet (and hands)" or "the whole man."

The quinary vigesimal system is found sporadically in almost all the Australian linguistic groups; in nearly all the Papuan languages of the (north) east coast and exterior of New Guinea, in the oldest Melanesian languages of New Caledonia, the Loyalty islands, etc. In Asia-Europe it occurs in the border languages: Ainu, Chukchi, Koryak, in Burushaski (*q.v.*), and in the Himalaya group of the Tibeto-Burman languages.

The decimal vigesimal system is found in the Munda languages of India and in Tibeto-Chinese groups of the Himalayas, in Nicobarese, in the north (and south) Caucasian languages. With the Indo-European and the Semitic languages the dual form for 20 seems to point to a former vigesimal system. The Sumerian, too, shows traces of it. Basque practises a full (decimal) vigesimal system, so that forms like soixante-dix, quatre-vingt, quatre-vingt-dix in French are to be explained.

In Africa the vigesimal system occurs in upper Guinea, and its hinterland, from the Senegal to the Cross river, in a series of Bantu, Mande, Togo and Niger languages, and in some east Bantu languages, in the Hamitic Kunama (and Barea) and in the Bantu languages Konde and Sango.

In North America it is found in Eskimo and in the north-west in Bellacoola and Haida and several languages of California, together with Pawnee (Caddo). This system mostly as decimal vigesimal is dominant in Mexico, Central America, even in the languages of the high civilization of the Aztecs and Maya. In South America the vigesimal system is found both in the progressive civilization of the Chibchas and with a great many primitive tribes belonging to nearly every linguistic group save the Gez-Tapuya and the tribes south of the Gran Chaco.

The quinary vigesimal system, especially its older form combined with the pair system, appears to have originated in the culture cycle (*Kulturkreis,* culture area) of the totemistic-patriarchal progressive hunters; a culture type in which the human body in art (sculpture), clothing and adornment has gained greatest importance and is most cared for. According to that the vigesimal system, too, agrees up to 20 with the parts of the body.

In north-western Africa on the coast of upper Guinea a quadragesimal system has developed, derived from a vigesimal system. Its origin is due to commercial reasons, as the monetary standard in this region is a set of 40 cowries.

The Decimal Systems.—The decimal systems are superior to the vigesimal systems in taking as a basis a smaller numeric unity more easily applied, and render possible shorter forms of the numbers. Two forms are known, the quinary decimal system and the pure decimal system. In the quinary decimal system the numbers of the second pentad are formed by composition with "five" ($6=5+1$, $7=5+2$, etc.) or by the pair system (especially $6=3\times2$, $8=4\times2$) or by subtraction (especially $9=10-1$). It seems to have originated in the matriarchal soil-tilling culture. The great quantity of agricultural products which had to be counted, arranged, stored, and brought to market required to be frequently repeated and counted quickly, and thus led to this system. In the languages of this culture numeral unities have developed which spring from the special grouping of certain products: a dozen, a brace, score (three score), etc.

In Australia and in the Papuan languages it is found isolated and in rudimentary form; with the Melanesians it is fully displayed. In Asia it originally dominated the two great families of the Austroasiatic and the Tibeto-Chinese languages. Whether a quinary or a pure decimal system was the original numeration in the Ural-Altaic languages cannot be ascertained. In Africa the great majority of the languages show originally a quinary decimal system, especially the Bantu and the semi-Bantu languages and the majority of the Nilotic, Wule, Ngo-Nke and Manfu languages. So too, in North America; but neither in Mexico, Central America, nor in South America has the system spread widely.

With the pure decimal system there is no partition of the decad into two pentads and therefore the compound character of the numerals from five to ten is not met with. The whole system

becomes simpler and its forms are better fitted for general application. The pure decimal system seems to have originated in the culture-cycle of the nomadic herders, who, in counting their large flocks of horses, cows, camels, sheep, etc., needed to employ high numbers with more facility. From the aristocracies of the nomadic herders it has spread everywhere, and it is now found in all nations of high culture on the whole globe, except those of Mexico and Central America, where the number 20 was used in astronomy, and thus was safe from competition. (W. Sc.)

NUMERATION: *see* NUMERALS; ARITHMETIC.

NUMIDIA, the classical name of a territory in the northern part of Africa. When the Romans first came into conflict with Carthage in the 3rd century B.C., the name was applied to the whole country from the river Mulucha (now the Muluya), to the frontier of the Carthaginian territory. Numidians were divided into two great tribes, the Massyli on the east, and the Massaesyli on the west, the limit between the two being the river Ampsaga. At the time of the second Punic war, the eastern tribe was governed by Massinissa, who took the side of the Romans, while Syphax, king of the Massaesyli, led the Carthaginians. At the end of the war, the Romans confiscated the dominions of Syphax, and gave them to Massinissa, whose sway extended from the frontier of Mauretania to the boundary of the Carthaginian territory, also south and east to the Cyrenaica, so that the Numidian kingdom surrounded Carthage except towards the sea. Massinissa, who reached a great age, retained the whole of these dominions till his death in 148 B.C. and was succeeded in them by his son Micipsa, who died in 118. For the war with Rome which followed the death of Micipsa, *see* JUGURTHA.

After the death of Jugurtha, the western part of his dominions was added to those of Bocchus, king of Mauretania, while the remainder continued to be governed by native princes until the civil war between Caesar and Pompey, in which Juba I. was defeated by Caesar. Numidia in the more restricted sense became for a short time a Roman province under the title of Africa Nova, but after the battle of Actium it was restored to Juba II., who had acquired the favour of Augustus. In 25 B.C., Juba was transferred to the throne of Mauretania, including the whole western portion of the ancient Numidian monarchy as far as the river Ampsaga, while Africa Nova was rejoined to the province of Africa; together with Africa Vetus it was governed by a proconsul, and was the only senatorial province in which a legion was permanently stationed. In A.D. 37 the Emperor Gaius sent a legatus of his own to take over the command of the legion (*see* AFRICA, ROMAN). Under Septimius Severus (A.D. 193–211) Numidia was separated from Africa Vetus and governed by an imperial procurator (*procurator per Numidiam*); finally, under Diocletian, Numidia became one of the seven provinces of the diocese of Africa, being known as Numidia Cirtensis, and after Constantine as Numidia Constantina. During this period it reached a high degree of civilization, and was studded with numerous towns, the importance of which is attested by inscriptions and by the massive remains of public buildings.

The invasion of the Vandals in A.D. 428 reduced it to a condition of decay; and the invasion of the Arabs in the 8th century again brought desolation on the land, which was aggravated by misgovernment till the conquest of Algeria by the French in 1833.

Chief towns of Numidia under the Romans were: in the north, Cirta, the capital, which still retains the name Constantine given by Constantine, and Hippo Regius, the see of St. Augustine; to the south, Theveste (Tebessa) and Lambaesis (Lambessa), connected by military roads with Cirta and Hippo respectively. Lambaesis was the seat of the legion III. Augusta, and the most important strategic centre.

For account of Roman remains, *see* AFRICA, ROMAN.

NUMIDINAE: *see* GUINEA FOWL.

NUMISMATICS (from the Latin *numisma,* a coin) is the study of coins and medals. Coins were first issued in the east and west in the 8th century B.C., and since then their use has spread over the whole civilized world. Unlike many objects in everyday use, they have always been highly prized by their owners, and were therefore frequently hoarded. As is still the custom in the east, it was usual to bury treasure for safety, with the result that the contents of such ancient and mediaeval savings banks are frequently turned up by the spade to-day. Coins are themselves the most imperishable of antiquities. The result is that they still exist in vast numbers of forgotten generations out of all proportion to other remains of the culture with which they were contemporary. The study of coins may therefore be expected to yield a considerable amount of information about the past, although we must be careful not to exaggerate their importance. Coins give us some idea of the wealth and importance of ancient states and cities. A study of the find-spots of coins gives an idea of their circulation in ancient times, and it is sometimes possible to make deductions about the extent of the dominion of a particular state from this; chronological analyses of finds, by reasoning from known dates to pieces of which the dates are hitherto unknown, has often given valuable results. The argument from find-spots has to be used with care, as commercial reasons frequently explain the finding of coins far from their original mints. Thus, the frequent finds of Roman gold of the early empire in India do not show that the Romans ruled there, but corroborate Pliny's reference to the tremendous drain on Rome for gold to pay for Indian luxuries; to go to the other end of the world, the huge finds of Arab silver coins in Scandinavia were brought there to pay for furs for the wealthy Abbasids and Samanids. At all times certain currencies have acquired especial popularity and have wandered far; such were in ancient times the tetradrachms of Athens and the staters of Philip II.; in mediaeval times, the dinars of the early caliphs and the ducats of Venice, and in modern times the Mexican and Maria Theresa dollar and the English sovereign.

Commercial and economic history can thus learn much from coins; their depreciation reveals times of economic stress; the base Roman antoniniani of the third century tell their tale as readily as the inflated paper currency of Germany in 1919. The imitation of the Edward I. penny on the Continent shows how welcome a really good coin was in those days of base deniers.

Coins and medals have preserved a series of portraits which throw light on the characters of their issuers. Of particular value is the light thrown by coins on ancient religion and mythology.

As datable objects they are above all valuable as the grammar of art. Not only do they throw light on local forgotten schools and preserve representations of long-lost masterpieces, but it is from them that the chronology of ancient art has been fixed. A long series of coins of a Greek town, ranging from the archaic period to the decline of art, sets a standard of comparison which enables sculpture and other objects to be dated.

The principal metals in which coins are struck are electrum, gold, silver, copper and bronze.

Electrum is a natural mixture of gold and silver which was used for the earliest Greek coins struck in Asia Minor (Lydia) until Croesus replaced it by pure gold. Electrum was the metal of the great 5th century coinage of Cyzicus. An artificial electrum was used in the 5th and 4th centuries in Carthage and Sicily.

Gold was the great currency of Asia, of the later Lydian kings, of the Achaemenids, of the Kushans and most Indian dynasties till the 12th, and again in the 17th century. In Europe it is not found till the great coinages of Philip II., Alexander III. and Lysimachus of Macedon; in Europe we find it in the Roman and Byzantine empires and their successors till the 8th century; it was revived in the 12th century with the great commercial currencies of the Italian republics and from the middle of the 14th century became the standard of the northern countries of Europe also.

In the ancient world silver was the currency of early Greece and of Republican Rome, and of the 9th to the 14th century in Europe generally; it was the currency of the Parthians, and on the whole of the Sassanians, and of the Asiatic state of the middle ages.

Bronze or copper was the early currency of Rome and Northern Italy and of China till modern times: it first appears in Greece towards the end of the fifth century, and here as usual in its later numismatic history throughout the world was used only for small change.

Lead has only been occasionally used for coins; the only lead currencies of any note are those of the Andhras of ancient India and the modern coinages of the Malay States. Iron was occasionally used in the ancient world and during World War I in Germany. Nickel was used in Bactria, 3rd century B.C., and has been extensively used in modern currencies since the middle of the 19th century. The only prewar aluminum coinage was that for British East Africa in 1908, but it was not a success. Aluminum and aluminum-bronze were used for a number of the post-World War I currencies of modern Europe.

GREEK COINS

A coin may be defined as a piece of precious metal stamped with some mark or type or inscription showing that it is issued by some authority which guarantees its weight and purity. Coins as we know them are not older than the 8th century B.C. Traces of more primitive currencies which preceded them survived into historic times. Passing over the stage of barter, when a superfluity of one necessity of life was exchanged by its owner for another necessity of which he was in want but could not so easily supply, it is found that certain things, notably oxen and instruments of husbandry, early became standards of value and were used as mediums of exchange. Among the Romans, for example, fines were exacted in cattle down to the end of the 5th century B.C. and the etymology of *pecunia* from *pecus* shows that coined money took the place of cattle. With the passing of a pastoral civilization and the transition to an agricultural community with its multiplicity of products, a demand for some more convenient medium and for small change was felt. There is abundant evidence of the use of agricultural implements and household utensils as currency in the ancient world. In China for example the earliest coins of the 8th century B.C. are models of the spades and bill-hooks which preceded them, with the addition of a proper coin-inscription showing they were issued by authority. In pre-historic Europe there were in Gaul hoards of small bronze celts which seem to have been used for currency. The most certain survival of this coin in the Mediterranean world is the iron or bronze spit (*obeliskos*—whence the name *obol* for a small coin). Hoards of these spits have actually been found in circumstances which show that they were currency. The most remarkable of these hoards of spits is that found in the Heraeum in Argos, dedicated by Pheidon himself—whether as specimens of demonetized currency or as standards set up in connection with Pheidon's reforms or simply dedicated specimens of the usual currency is disputed; similar bundles of spits in bronze and iron have been found in Etruria. In Homer basins, tripods and axes were used as gifts and prizes in a way which shows that they were a recognized standard of wealth. With the invention of the scales these more or less clumsy currencies disappeared and the metal itself is used; a definite weight takes the place of a particular shape. In all countries from the 10th to the 5th centuries B.C. existed hoards of broken bronze or silver, sometimes shapeless, sometimes cast in the form of bricks or plates; later it is regularly in the form of bars which could be broken and weighed. There are finds of silver of this kind from Assyria of the 8th century B.C. and from Egypt and south Italy of a little later. The Egyptian finds frequently contain Greek silver coins chopped in a way which shows they were considered only as bullion. In Italy in particular rude chunks of copper (*aes rude*) were regular currency from early times to the 3rd century B.C. as is known from literary references and from finds. Caesar wrote that the ancient Britons used iron bars of a definite weight, and specimens still survive; excavations have also confirmed the accuracy of Plutarch's reference to the iron money of the Spartans.

The large oblong Roman bronze pieces with a type on either side form a kind of transition from metal bars to coins although they are not earlier than some Roman coins. In any case it is a short step from the use of metal by weight to its use in pieces of definite weights with a stamp of some kind guaranteeing it is what it professes to be, so that it can be paid without weighing; at this stage it becomes a coin. It is in this form that coinage first appears in Greece and India.

Period I. 750–480 B.C.—Ancient writers—Xenophanes in the 6th and Herodotus in the 5th century—ascribe the invention of coinage to the Lydians; the latter says they were the first to strike coins of gold and silver. This definite statement probably refers to a period after the beginnings of coinage when Croesus of Lydia struck coins of pure gold and pure silver. There is, however, evidence of an earlier coinage of Lydia and Ionia of electrum, a natural mixture of gold and silver, the "white" gold of the Greeks; these early pieces, as the finds at Ephesus show, belong to the 8th century B.C. They are little globules with a variety of stamps which suggests that they are private issues and not issues of a state authority; this early coinage is irregular in weight and quality and unsystematic in character and it is not until the issues of Croesus that there is in Asia Minor an undoubted coinage by a state authority. The types on his gold and silver coins are the same, the heads of lion and bull facing one another and reverse a double incuse square caused by the anvil in striking.

In contrast to this early electrum coinage, irregular, alike in quality, types and shape, is the almost contemporary earliest coinage of Greece proper, even the oldest specimens of which, unlike the electrum, are at once recognizable as coins to the least trained eye. These coins are of silver and capable of definite attribution. The oldest are those of Aegina, and if the not early but persistent ancient tradition which says that coinage was invented by Pheidon, king of Argos, is correct, these would be his coins. The type of Aegina is a turtle—an animal associated with Aphrodite—on the obverse, an incuse square on the reverse. That the coins of Aegina are the earliest is supported by the fact that the Aeginetic standard is the most common on the earlier coins of the islands, the Peloponnese and Greece proper. It was later supplanted by the Euboic-Attic standard, the adoption of which by Solon for Athens led to its wide dissemination. By the end of the 6th century the practice of striking coins was well established in many centres. Corinth with its *pegasi*—from their type of a pegasus—struck staters on its own standard, a variant of the Attic and began to strike not long after Aegina. It is not improbable that Periander was the institutor of the Corinthian coinage which became one of the great commercial currencies of the Greek world. The date of origin of the coinage of Athens is still uncertain; the well known types of the head of Athena on the obverse and her attribute the owl on the reverse date from the middle 6th century and are the earliest coins with a type on both sides and the earliest also to bear a human head. The exact attribution to Athens of its Solonian and pre-Solonian coins is still disputed. By the institution of the "owls," a type of coin, obverse deity and reverse an attribute of the deity, was developed which had a far-reaching effect on the development of coin-types. The head of the king on an English penny goes back to the head of Athena through the deified head of Alexander and the Britannia on the reverse similarly can be traced back to the owl. Other important towns like Thebes and trading centres like Corcyra began to issue coins about this time but a number of important towns seem to have still been content to use the currency of their neighbours. In the 6th century also are the earliest coins of Africa in the issues of the Spartan colony of Cyrene with its badge the silphium plant, the cultivation of which was its great source of revenue. Coinage was also begun by the Greek colonies in south Italy and Sicily; these latter are of a characteristic fabric. Instead of the thick dumpy piece with a type on the obverse only and an incuse square on the reverse which are common to the cities and islands of Greece, these are broad thin pieces with the type struck on both sides, in relief on the obverse, incuse on the reverse. There still exist many coins of this type of Tarentum, Metapontum, Croton, Rhegium, Zankle (Messana), etc. By the time of the Persian Wars coinage was a familiar feature of everyday life in the cities of the Greek world. Traders and colonists had carried the art to Cyrene in North Africa from Sparta, to south Italy from Corinth, and to Sicily from Athens and the Peloponnese. In Asia Minor also coinage spread southward and had reached Cyprus but not yet Crete. The Phoenicians and Egyptians were already familiar with Greek coins but did not

attempt to copy the invention; in the north however the silver mints of Thrace and Macedon were beginning to be worked vigorously and not only the Greek cities but the barbarian tribes, also, who employed Greek legends on their coins, were actively striking.

The various coinages of this early period (down to 480 B.C.) have a number of features in common. One of the most remarkable to the modern eye is the absence of inscriptions; these are either non-existent or consist only of the initial letter or letters of the town issuing the coin. The device of the town was originally sufficient for local circulation but as coins began to go further afield it became necessary to add some indication of its name. The earliest coin legends are therefore very brief: a *koppa* for the initial of Corinth, a Φ (*phi*) for Phocaea, Σ Γ (*Su*) for Sybaris, ΑΘΕ for Athens, and so on. The earliest inscriptions of any length are still written from right to left. Long inscriptions like "I am the badge of Phanes" above a stag on an archaic coin of Ephesus or "the stamp of Gortyna" on an early coin of the Cretan mint of Gortyna are remarkable exceptions and important as showing the original nature of inscriptions and of the types themselves. They show that the genitive, which is the usual form of the name when written in full, although nominatives are not very rare, is explanatory of the type.

Types.—The types in the early period are mainly taken from the animal world; they include domestic—particularly the bull—wild animals, birds and insects (the bee at Ephesus); fabulous creatures are also common like the griffin at Abdera, the pegasus at Corinth, the Chimaera, etc.; the vegetable world is also represented, notably by the silphium plant at Cyrene. Representations of the human figure are rarer and later than other types to appear, but once the human head became established as a coin-type, its use spread rapidly and widely and with the disappearance of the incuse square and coming of the double typed coin a head began to be regularly used as one of the types. Complete human figures are rare and are represented either kneeling or standing, both very stiffly like the Poseidon at Poseidonia; the nymph and satyr or centaur common in Thrace hardly deserves the name of a group; elaborate compositions like the Hercules and Hesperides at Cyrene and the flight of Aeneas at Aeneia are quite unique.

With the coming of legends on coins it was no longer necessary that the main type should be the badge of the town, which is frequently relegated to the reverse or becomes merely a symbol or disappears altogether to give the artist a subject more worthy of his talents. Except in the doubtful case of the earliest electrum, coinage was always a matter for the ruling authority whether civic or regal and the earliest types are chosen to show who these are. That coinage was early recognized as too important a right for private ownership is seen from the traditions which associate all the great lawgivers, Pheidon, Solon and Lycurgus, with the institution or improvement of coinage. The sanctity of the republic's right of coinage is seen in the coinage of cities ruled by tyrants, who never put their name or other indication of their existence on the coins, although they occasionally made alterations in the types, as when Peisistratos added the head of Athena to the Athenian coins or when Anaxilos of Rhegium introduced the mule-chariot type in memory of his Olympic victory.

The early types are generally chosen from simple motives. Many of them are a punning allusion to the name of the town like the lion at Leontini, the seal at Phocaea, the goat at Aegae or the quince at Melos, or the sickle-shaped harbour at Zancle. Sometimes it is chosen from the history of a town like the figure of the mythical founder Taras at Tarentum or the Minotaur and Labyrinth at Cnossos. Types like the ear of corn at Metapontum allude to the fertility of the country about. Thrace and Macedon are notable for their huge silver octodrachms with the type of a local hero in a chariot drawn by two bulls. In Italy, Croton takes as its type the tripod of Apollo like its mother city Zacynthus. Poseidonia has a statue of Poseidon brandishing his trident. Naxos in Sicily, whose founders came from Naxos in the Aegean, has a head of Dionysos who was born in the Aegean island. Himera has a cock, a punning allusion to the name of their town for the cock proclaims the dawning of day (*hêmera*). Selinus has another punning type, the wild parsley leaf (*selinon*). Toward the end of the 6th century B.C., Syracuse introduces the celebrated type of the head of Arethusa, the nymph of a spring in Ortygia, which was in the next century to become the most famous of Greek coin types. The reverse, a victorious chariot, became a popular one in other towns. The finest specimen of this type of late archaic style is the *Demareteion* commemorating the victory over Carthage in 480. The head of Arethusa on the obverse wears the laurel wreath of the victorious and beneath the chariot on the reverse is a lion, the emblem of conquered Africa. This type of obverse spread throughout Sicily; the main types of Sicilian towns in the 5th century are local nymphs and river gods. At Catania we have the river god Amenanos; Gela has a manheaded bull swimming, a personification of the river Gelas.

Period II. 480–336 B.C.—The finest period in Greek coinage begins after the Persian Wars and runs to the accession of Alexander the Great in 336 B.C. The first half of this period is transitional and is marked by a great advance in technical skill, an increased delicacy in the treatment of details and greater freedom of movement in the treatment of the human figure. In the last eighty years of this period the art of engraving coins reached the highest standard it has ever attained: the head of a divinity is now established as the obverse type and is usually represented in very high relief—many of the finest are shown facing; the engravers sign their coins which show that they were artists of note and not mere artificers: the names of great artists otherwise unknown have been thus preserved. The types are very varied and almost entirely based on local mythology, although latterly the fine bigae and quadrigae types became popular in allusion to Olympic victories. The type first introduced in Athens—obverse head of a deity and reverse badge of the city—grows increasingly popular and towards the end of the period is almost regular. Inscriptions become general although still frequently contracted. The period is marked by a geographical extension of coining and an increase in its quantity; with the decline of the Persian empire, the cities of Asia Minor, Phoenicia and Syria show an increasing activity; the opening of the mints of Emporiae in Spain and Messalia in Gaul bring the art of coinage to the other end of the known world. Towards the end of the period the rise of Macedon under Philip II. led to the closing of many mints in northern Greece, and his coinage foreshadows the great imperial coinages of Alexander the Great. The second half of the 5th century witnesses a great expansion of the monetary influence of Athens at the expense of her allies.

The coinage of the period is mainly silver; the Aeginetic standard gradually yields to the Attic: electrum disappears except at Lampsacus and Cyzicus and sporadically at Syracuse and Carthage. Gold is continued in the darics of the Persian kings in the east and in the fine series of Lampsacene staters; with the decline of Persian power the Great King's monopoly of gold was usurped by various rulers in Cyprus and Caria. The late 5th and 4th century gold coinages of Syracuse, Tarentum and Cyrene are extensive. Toward the end of the period we have the institution of Philip II's gold stater, the first great gold coinage of the world. In the latter part of the 5th century the first copper coins were issued and soon replaced the infinitesimal small silver coins which had hitherto served as small change.

The greatest commercial currency of the 5th century was the silver coinage of Athens, as contemporary references and the huge finds still made all around the Mediterranean show. It was imitated in Central Asia and Arabia which shows the extent of its penetration. The Corinthian stater continued to be an important coinage although its circulation was more limited. The same is true of Cyzicene staters: these great currencies remain more conservative than their contemporaries which are not affected by the same commercial considerations; care is taken to avoid the slightest change, hence the long survival of the now obsolete *koppa* on the coins of Corinth or the archaic use of E for H at Athens.

The feature of the period is the development of the general type—head of a deity on obverse and reverse, the badge of the city—which usually has some reference to the deity also. We find

the latter prevailing in time so that when the old type has no reference to the deity chosen, it is dropped. The gradual abandonment of these old types gave a freer choice to the artist and the simple figures of animals, plants, fabulous animals, etc., give way to mythological groups. Symbols begin to appear on coins and are usually the marks of magistrates or otherwise mark the issues and change constantly. Occasionally we find the old badge of the town relegated to a subordinate position, like the tunny fish at Cyzicus. Names of towns and magistrates are written at greater length and those of artists begin to appear. Types are occasionally labelled like the Zeus at Locri Epizephyrii or the Ajax at Locri Opuntii.

Predominance of Athens.—The causes of the predominance of Athenian currency were firstly the development of rich silver mines in Laurium in the beginning of the 6th century, which provided the money to build the ships which defeated the Persians at Salamis in 480 and secondly the prosecution of her policy of prohibiting silver issues by any city or state that came within her power, whether as tributary or as a member of the alliance in which she was the predominant partner. The members of the Confederacy of Delos while nominally retaining their monetary rights bowed to the practical advantages of a common coinage—which was that of Athens. The fine quality of its silver, the accuracy of its weights and its numerous subdivisions made the Athenian tetradrachm welcome everywhere so that Athens gained the monetary hegemony in addition to the political. In 453 Aegina became tributary to Athens, which at once put a stop to the issue of the "tortoises" and the stater of Aegina practically disappeared from the international market where it had so long competed with the "owls." Eretrea on its conquest in 445 lost its right of coinage as did its neighbour Carystus. Tenos, Naxos and other Aegean islands also ceased coining. In Asia Minor, Miletus, Cnidos and other tributaries of the Confederacy issued only small change.

One notable exception is that of Melos, which had refused to enter the League and therefore could still continue its staters. Samos and Lesbos kept up their issues but they were allies of equal status to Athens; Ephesus which entered the Confederacy in 469 continued to coin silver till 460, but there was seemingly some special arrangement in this case. Aeolis, Mysia, and Troas only struck small change. Several towns of the south coast of Thrace, like Abdera, continued their coins but these with their different standards did not compete with those of Athens in the markets of the Aegean. Phocaea, Mytilene and Cyzicus continued their electrum in the 5th century but their silver ceases. The Athenian tetradrachms thus became predominant in the Aegean and beyond, completely ousting local currencies. If we occasionally find autonomous staters, it is a sign of rebellion or shows that the town in question entered the League with special reservations. With the first news of the disasters in Sicily a general defection began and the days of the economic supremacy of Athens were soon over. The Spartans seized the mines of Laurium in 413 and cut off the supply of silver. In 407 Athens was reduced to such financial straits that the gold statues of Victory from the Parthenon were melted down for an emergency coinage; in the next year she had to have recourse to a coinage of bronze which had an unfavourable reception as it could not, like the infinitesimal silver pieces, be carried in the mouth. After being almost extinct, Athenian coinage revived after Conon's successes in 394. On the formation of the second League against Sparta, her allies however struck coins on equality with Athens and used a common type of the infant Hercules with their own reverses and their own standards. Such staters are known of Ephesus, Cnidus, Rhodes, Samos, Cyzicus and other islands and towns of Asia. This diversity of standard in the League shows that there was no monetary convention. Among the rising coinages of this period one of the chief was that of Rhodes founded in 408. Its silver and gold coins have the punning type of the rose and head of Helios. Rhodes had its own standard and its rapidly increasing commerce spread its coinage and standard quickly in the Mediterranean. In 376 Athens regained its hegemony over the islands but for a generation only. Its coinage again became abundant but never regained a predominance over the numerous local coinages which had sprung up since the end of the 5th century. In addition to Rhodes the important mints of Amphipolis and Larissa begin to issue their beautiful coins and many smaller towns open their numismatic history. The ancient coinages of Samos and Chios disappear before Athenian vengeance in the middle of the 4th century but other towns of Asia and the islands, Cnidos, Ephesus, Tenedos, and notably Cyzicus, testify in their coins to the great prosperity which their autonomy brought them. Corinth and its colonies continued to issue their staters of the old types uninterruptedly up to their conquest by Philip II. and even then did not lose the right of coinage. With this exception however the great revival of autonomous coinage in the early 4th century was short-lived. Philip II. became politically supreme, and economically his gold and silver mines enabled him to drive the gold of Cyzicus and the silver of Athens from the market, but the Attic standard was to survive in the tetradrachm of Alexander. In 404 the people of Aegina after half a century of exile returned to their homes to resume the issue of their celebrated staters but replaced the turtle of the obverse by a tortoise.

The 5th century saw the beginning of one of the finest and most interesting series of silver coins, that of Elis. From about 471 when Elis became a city to its conquest by Macedon in 322 the staters form a continuous series. The whole land was sacred to the Olympian Zeus and his symbols, the thunderbolt or eagle clutching its prey, are usual types along with a Victory in various attitudes—running to crown a victor, standing or seated with outspread wings—the latter type was copied by Pistrucci for the Waterloo medal in 1815. At a later period the head of Zeus appears as does that of Hera and also the fine head of the nymph Olympia. The legend is always FA for (F)*aleion* and the long obsolete digamma survived to the end of the coinage in the middle of the 1st century B.C. The types and the additional legend *Olympikon* occasionally found show a close connection with the Olympic games which the Eleians claimed to control. There is an interesting numismatic record at Pisa of the successful effort on the occasion of the 104th Olympiad by the Pisatans to regain their ancient right of controlling the games which they had lost when the Eleians destroyed their city in 572 B.C.

Italy and Sicily.—It is in the west in Italy and Sicily that work of the finest period is seen in greatest profusion. In Italy, Tarentum, the capital of Calabria, continued its type of Taras on a dolphin on its silver. In the middle of the 5th century the agonistic type of a horseman appears and Taras is relegated to the reverse; the celebrated Tarentine cavalry are thus commemorated down to the middle of the 4th century. About 340 Tarentum issued a series of very beautiful gold coins with a head of Persephone and, reverse, the infant Taras appealing to Zeus enthroned. These gold coins, like sudden issues of gold elsewhere, were really a money of necessity.

In Lucania, Heraclea, founded in the middle of the 5th century, issues fine staters with a helmeted Athena and Heracles seated, strangling, or wrestling with a lion. Metapontum interrupts the monotony of its ear of corn type with a most striking head of its founder Leucippus. Other mints of the time are Neapolis, with its types the siren Parthenope and her father, the manheaded bull Archelous; Velia, with its head of a nymph and reverse the eastern type of a lion attacking a bull; Thurium, with its unusually fine head of Athena and the powerful bull on the reverse, and Terina, remarkable for its beautiful treatment of the Victory type.

It is in Sicily, particularly in Syracuse, that the engraver's art reaches a perfection never attained elsewhere before or since; from the middle of the 5th to the middle of the 4th century every coin is the work of an artist. In the 5th century Syracuse began to dominate the politics of Sicily as Athens was doing in the Aegean, and her artists spread the influence of her coin-types everywhere. The coins of Syracuse showed many varieties of the heads of Arethusa and Persephone and the chariot of the reverse was found capable of very varied treatment. After the middle of the 5th century her artists began to sign their work and we

can thus prove, what is frequently obvious, that other towns borrowed engravers from Syracuse. The Syracusan coinage is mainly silver. During the siege by the Athenians, beautiful little gold coins were struck with reverse Hercules strangling a lion. With the prosperity following the enemy's defeat, Syracusan art reaches its zenith. As the *Demareteion* commemorates the defeat of the Carthaginians, so the great series of decadrachms perpetuates the victory of 412. The agonistic types and word *athla* on some of them show that they were distributed at the games held to celebrate the victory; their types were widely copied and their engravers, Kimon and Euainetos—otherwise quite unknown—have gained a place among the world's greatest artists. In the 4th century the coinage becomes somewhat stereotyped and has no longer any originality. We may note the issues of electrum by Dion in 357–353 and of gold by Timoleon, who introduced the Pegasus type from Corinth on his coinage.

Among other cities of Sicily we may note the fine series of Agrigentum of the 5th century with its beautiful double eagle type and the Camarina type of the river god Hipparis and the nymph Camarina on a swan. Himera before its destruction in 408 issued some very interesting types, such as the nymph Himera sacrificing while Silenus beside her bathes at the thermal spring for which Himera was noted; or Pelops in his chariot, referring to a victory of a Himeran at the Olympic games which Pelops is said to have founded. Segesta, Eryx and other cities already Carthaginian use Greek types and artists but have Punic legends. The nymph Segesta and the river god Crimissos are the best types of Segesta while Selinus abandons its parsley leaf and issues a number of very remarkable types, notably that of Apollo and Artemis in their quadriga with reverse the god Silenus sacrificing at an altar, a type which refers to the cessation of the plague as a result of appeals to Apollo as healer. In conclusion we may mention the wonderfully realistic Silenus with his wine cup at Naxos.

Period III. c. 336–c. 100 B.C.—Alexander's conquest considerably extended the sphere of Greek influence and in this period there is a further extension of coinage. Egypt, hitherto coinless, now produces the richest series of the Hellenistic period. Bactria and Parthia, too, strike Greek coins. Spain and Mauretania begin to issue coins; in the north the Gauls, Britons and Germans begin early in the 2nd century to imitate Greek coins and soon learn to strike more independent issues. The influence of Alexander's coins is decisive in the coinages of his successors in their different kingdoms. Only a few free towns strike their own silver and even they tend to use Alexandrian types. The period produced a number of coins of alliances like the Achaean and Thessalian leagues. In the west the gradual advance of Rome is reflected in the coinages; local silver ceases earlier in Italy and Sicily than in Greece and Asia.

The accession of Alexander the Great in 336 inaugurates a new epoch in coin types. The main feature of the period from his accession to the conquest of Greece by Rome is the final establishment of the portrait coin as the regular type of a currency and the great preponderance of regal issues.

The portrait of a living monarch took nearly a century to establish itself on a coin. Philip II and Alexander the Great issued vast coinages throughout the ancient world but were content to put their names alone on the coin—latterly Alexander added the title "Basileus." After his death his deified portrait appeared on the coins of Lysimachus in Thrace and on the early coins of Ptolemy I in Egypt. It is not till 306 that we have a portrait of a living king on his coins when Ptolemy I appears, still as god with the aegis of Zeus. Seleucus I similarly puts himself on his coins as Dionysos; in time the divine attribute is dropped and the ruler appears as a mortal wearing only the royal diadem. In Macedon Arrhidaeus, Cassander and Antigonos still follow the types of Alexander, and the early coins of Demetrius Poliorcetes (306–283) are without a portrait. Soon, however, his own portrait appears, still with the horns that deify him. His successors have only types of deities. Pyrrhus does not appear on any of his extensive coinages but the last two kings of Macedon, Perseus and Philip V, have left very fine portraits. The kings of Pontus, notably Mithridates VI, have a magnificent series of portraits. The kings of Pergamon use the same portrait throughout, that of the founder of the dynasty, Philetairos I, and the Ptolemies in Egypt throughout their long series use only the head and legend of Ptolemy I, except on certain special issues. Among the early Seleucids Antiochus I was reluctant to drop the portrait of Seleucus I, but the portrait of the reigning monarch becomes the rule in this series; farther east we have the long series of portraits of the Arsacids and the unparalleled series of Bactrian and Indian kings. The smaller series of Persis gives some portraits, but they rapidly become stereotyped as do the coins of Elymais and Oman. The Jews, with that strict interpretation of the second commandment as is later the case among the Arabs, have no portraits, but the Nabathaean kings have.

The reverse types also show the influence of Alexander; seated deities become common and go back to the Zeus on the tetradrachms of Alexander, or standing deities which go back to the Nike on his gold. The Seleucids have commonly a seated Zeus or Apollo. The Parthian series is unusual—the reverse shows the king seated, (perhaps) Arsakes I, the founder of the dynasty, treated with the respect due to a deity. The king's name remains on the reverse in keeping with its development as the successor to a town name and does not yet appear alongside of the portrait. The ancient world did not know the custom of numbering kings of the same name; they are as a rule sufficiently distinguished by their epithets.

After the vast issues of gold by Philip II, Alexander and Lysimachus, gold is but rarely struck, except in Egypt. Silver is the general metal of coinage and the Attic standard, which Alexander had adopted for his tetradrachms, became the monetary standard of the world, except in Egypt; there is a great increase in the bronze coinage, the local issue of which does not seem to have been seriously restricted by sovereigns and suzerains.

As the greater part of the Greek world was now ruled by the Diadochi, their various coinages naturally formed the main currencies of commerce. A number of civic and other coinages still survived however. Third-century Athenian coinages are scarce except in bronze; occasionally as in 296 the issue of gold shows the straits to which the once wealthy city was come. In 229 when Macedon lost its supremacy over Athens and friendly relations were established with Rome a new era begins with the abundant issue of tetradrachms of the "new style" which went on for two centuries. The Athena of these coins is not the old one but a copy of the head of the Parthenos of Phidias and the owl on the reverse is now perched on a Panathenaic amphora. The ΑΘΕ still remains but a number of new legends and symbols are added to the reverse chronicling a long series of magistrates. Much light is thrown on the organization of the Greek civic mints from these names and symbols. The other great coin issuing city, Corinth, went on striking its stater till 229 when by its surrender to Doson the long series came to an end.

Rise of Rome.—The Roman conquest of Greece is reflected in the coinages. When the Romans overthrew Philip V in 197 or Perseus in 168 they professed to be restoring the liberties of the Greeks and it is clear from the resumed activity of the mints that the Greek cities were autonomous in one respect at least. After the defeat of Philip V the Thessalians formed a confederation with silver coins of the type of Zeus and Athena and the legend *Thessalōn;* a similar coinage was issued by the Boeotians. With the final overthrow of Macedon at Pydra in 168 begins the extensive issue of tetradrachms of Maronea and Thasos which became a great commercial currency for trade across the Danube with the barbarians, who continued to imitate them. Macedon itself as a Roman province issued tetradrachms bearing the names of Roman governors. In Asia after the defeat of Antiochus III at Magnesia we have an outburst of tetradrachms of Attic weight and local types at towns like Lampsacus, Smyrna, Magnesia and many others. Other cities similarly resumed the issue of Alexander tetradrachms, adding a small symbol to mark the town of issue—Miletus, Samos, Rhodes and many other Asiatic cities. These Alexander types continued down

to the middle of the 2nd century when the Roman province of Asia was set up and the *cistophori* replaced them. The first *cistophori*, so called from the Dionysiac chest which formed the principal type, were first struck at Ephesus at the end of the 3rd century; the reverse is a bow in quiver between two serpents. The Pergamene kings popularized them and the Romans thus found it easy to substitute them for the Alexandrine tetradrachms with their undesirable associations. *Cistophori* were now struck in many Asiatic mints and bear the monogram of the town of issue. The last stage in the Roman conquest of the east was the defeat of Mithridates and those towns that had assisted him had their coins replaced by *cistophori* with the exception of Athens which obtained favoured treatment. The fact that Rhodes resisted Mithridates and assisted Sulla enabled its autonomous silver coinage to survive down to the Civil War:—it was the last autonomous coinage of Greece.

In the west the rise of Rome in the 3rd century introduced a new factor into the history of Greek coinage. The first coinage to disappear was the Etrurian after a life of two centuries. Rome's early intercourse with the Greek cities of Italy is reflected in the Romano-Campanian coinage. In the south the Italian campaign of Pyrrhus left its mark on various coinages, notably at Tarentum which also has some exceptional numismatic records of Hannibal's occupation. The towns of Magna Graecia gradually lost their silver coinage under Roman influence although their bronze lasted till the 1st century.

In Sicily in the 3rd century Syracuse began to dominate the whole island in coinage as well as politically; the types are mainly imitations of those of the 5th and 4th centuries; the coins of the other towns have little claim to originality. The Punic Wars brought the Romans to Sicily where the Carthaginians had been established since the end of the 5th century and had struck coins of Syracusan and other Sicilian types with Punic legends and later with their own types. When Syracuse fell to Rome in 210, Sicily became a Roman province; henceforth only bronze was struck in it; these local coins continued into the first century, when the last trace of Greek coinage in the west disappears.

Period IV. c. 100 B.C.–A.D. 268.—Under the Romans many Greek cities and districts continued to issue their own bronze coins but the geographical area over which this was done became considerably restricted under the empire. In the west—Italy, Gaul, Spain and North Africa—the right of coinage was abolished quite early in the empire, the latest local issue of these regions being a coin of Babba in Mauretania of the reign of Galba. In the east, particularly in Asia, these local bronze coinages went on down to the time of Gallienus in 268, when the complete depreciation of the Imperial silver coinage, now bronze washed with silver, made the issue of bronze for small change pointless. The language of the inscriptions is Latin in the west and Greek in the east—with a few exceptions in the latter case. The Imperial gold (solidus) and silver (denarius) became the main currencies throughout the Roman empire.

Before dealing in general with the bronze of the Greek cities, we may note one or two local subsidiary silver coinages issued by the Roman emperors in continuation of important pre-conquest coinages. The largest series of these was the Egyptian or Alexandrian series which runs from Augustus to Diocletian. In addition to bronze, this series at first included tetradrachms of billon of gradually decreasing fineness, which continued the tetradachms of the Ptolemies; later it is of bronze only. The legends are always in Greek; the coins bear the emperor's head on the obverse and the reverse types are at first usual Roman types but after the end of the first century begin to include native Egyptian types in increasing numbers, often of peculiar interest. The reverses are dated in regnal years in Greek numerals. From the reign of Claudius II. there is only one denomination, a small thick bronze piece originally coated with silver, which is probably still the commonest of all ancient coins. The earlier bronze which occasionally, although not generally, rival the work of the Roman mint have in the 2nd century a characteristic bevelled edge.

In Syria silver tetradrachms continued to be struck, mainlv at Antioch but also at Tyre and a few other mints. These gradually became baser in the course of the early third century. Copper was also struck by the Romans at these mints and frequently bears the letters S C showing that this issue, as in Rome, was the prerogative of the Senate. Of several other local silver coinages the large series of drachms struck at Caesarea in Cappadocia from Tiberius to Commodus is the most important. The usual type is a local one of Mount Argaeus but common denarii reverses are also found.

A number of vassal states and protectorates continued to issue their own coinages in the precious metals until they became Roman provinces. The only gold coinage of this kind is that of the kings of the Bosporus who struck coins from the time of Augustus to the beginning of the 4th century with the Roman Emperor's head on one side and the local dynast's on the other. This coinage becomes gradually debased, passing from gold to electrum then to silver and billon and ultimately to copper in the 3rd century A.D. At the other end of the world, the kings of Mauretania continued to strike their own gold and silver until it became a Roman province in A.D. 40.

Bronze Coinage.—We now come to the regular series of Imperial Greek bronze coins which close the thousand years of Greece's numismatic history. They have no claim to artistic merit and are of local workmanship; therein they form a contrast to the regular Roman coins of the time which frequently attain a very high level. If they are devoid of artistic interest they have a very high historical and archaeological value.

The right of coinage is sometimes continuous and sometimes intermittently permitted by the Emperor or governor. Sometimes the right is held alternately by pairs of towns as in Moesia by Marcianopolis and Nicopolis. Coins are struck not only by single towns but jointly by alliances of towns (*homonoia*).

The general type is everywhere the same; obverse a bust and reverse a type of local interest. Under the Republic the Greek cities usually placed on the obverses of their coins an allegorical bust,—that of some local hero or of the "people" the "Senate" or the local city-goddess. The People (*Demos*) in Asia Minor is usually personified as a young male bust; the municipal council (*Boule*) and the Senate (*Sunkletos*) appear as young veiled females. The Tyche of the city appears as a female bust wearing a mural crown. The goddess Roma is found as a helmeted female, *e.g.*, at Smyrna. Pergamon and other towns of Asia Minor have Poseidon. Athena, Apollo and other well-known divinities are also found on the obverses.

Under the empire the usual obverse type is the head of the Emperor as on the regular Roman series. There are some notable exceptions. Macedonia for example had the head of Alexander the Great. Athens was privileged by Hadrian to use the head of Athena in place of the Emperor's. These are exceptions; the usual type is the bust of the Emperor and the obverse legend gives his name and titles in Greek, usually transcriptions or translations of his Latin titles, with occasionally some local allusion. The reverse type is reserved for the town of issue and the date when given is in a local era. The name of the town is in the genitive plural of the ethnic, very frequently with the addition of some proud epithet, of more or less significance. These epithets are of various kinds; many refer to the emperor either to flatter him or in memory of some benefit received. Some recall the origin of the inhabitants; Blaundus in Lydia, for example, calls itself Macedonian because it was originally a colony of Macedonian soldiers. Very favourite adjectives are "autonomous" and "free" but the most highly prized is that of *Neokoros*, which in Imperial times signified that the town had built a temple in honour of the Emperor. Ephesus for example proclaims in the reign of Caracalla that it had built 3 imperial temples. Capitals of provinces call themselves *Metropolis;* the title "first city" of the province is also highly prized and occasionally disputed, as we see from the coin-legends of Nicomedia and Nicaea in Bithynia or of Smyrna and Ephesus in the province of Asia. Towns in Phoenicia and Syria which had a temple with the right of asylum call themselves *ἱερά καὶ ἄσυλος*; a number of maritime towns bear the title *ναυαρχίς* officially granted them by the emperor in recognition

of their naval importance. Damascus calls itself "illustrious," Syedra "brilliant," Nicaea "greatest and best" and there are many such empty titles.

Besides the ethnic these coins very often bear the names of magistrates and other officials; in the early years of the empire these include a few governors and other officials sent from Rome, some of whom even have their portraits on their coins, like the younger Cicero at Magnesia. But throughout the series the names and titles of local magistrates are vastly more common. These throw a good deal of light on local life and administration.

It is the reverse types of this series of coins that give them their importance. The coins of Athens preserve representations of many statues famous in antiquity which have long since perished such as the Athena Parthenos of Phidias, the great Athena Promachos on the Acropolis visible far out at sea, or the Dionysos of Alcamenes. A coin of Elis preserves for us the Olympian Zeus of Phidias and Lacedaemon the Apollo of Amyclees. Local cults are everywhere illustrated and incidents in the lives of all the divinities of Greek mythology are common types. Not only do we have gods and goddesses but also all kinds of local deities like river gods and nymphs. Local celebrities are also recorded; thus we have Homer at several of the various towns that claimed him as a native notably Smyrna, Anacreon at Teos, Sappho at Eresos in Lesbos, Herodotus at Halicarnassus, Alcaeus at Mytilene which records on its coins a whole series of its famous men, the majority of whom are not otherwise known. Not only are famous Greeks commemorated; the travels of Hadrian in the provinces led to the issue of many specially fine coins, some of which bear the portrait of his favourite Antinous.

Agonistic types are very numerous on account of the great part played by games and festivals in the life of the time. Their celebration is frequently recorded on coins; sometimes we learn that the town was not able to bear the expense and that officials or private individuals were ready to bear the expense in return for the honour of presiding and this is duly chronicled. In addition to the four great Hellenic Games we find many of more recent origin instituted in honour of the Emperor, like the Actian games in honour of the victory of Augustus at Actium, celebrated at Tyre and other towns, the Philadelphian in honour of Caracalla and Geta at Nicaea, etc., or in honour of local deities like the Panathenaic at Athens, or the Heraclean at Perinthus commemorated by a series giving the labours of Hercules. When two or more cities combined to have a joint festival, this is commemorated by a joint issue of coins. In conclusion we may mention a notable example of the preservation of a local tradition on a Greek imperial coin. On a coin of Septimius at Apameia in Phrygia we have as reverse type a man and woman in a chest or ark floating on water with a raven on the top and a dove flying above with a branch in her beak; to remove any doubt as to what scene is represented the ark is labelled NΩϵ and the coin is evidence of the local tradition that the ark rested on the mountain behind Apameia.

ROMAN COINS

It was comparatively late in her history that Rome emerged from obscurity and became a great city. The adoption of a coinage was one of the most significant signs of the change. In very early times Rome had reckoned values in oxen and sheep, hence the word *pecunia* (money), from the same root as *pecus* (head of cattle). Later she began to use bronze as a means of payment,—but as yet only in rough, unstamped lumps (*Aes rude*), not as coins. The later tradition represents her as ridiculously poor in the precious metals, and the little that we know confirms it.

The exact date at which Rome passed on to the use of metallic currency is subject to some doubt. It is certainly not earlier than 338 B.C. (the date proposed by E. J. Haeberlin), and a strong case can be made for a date rather later. The Roman authors, who attributed the innovation to the king Servius Tullius, had no real knowledge of the facts. The first pieces issued were heavy cast coins of bronze (*Aes Grave*) representing the As, the unit, a pound of bronze and its subdivisions—semis, ($\frac{1}{2}$), triens ($\frac{1}{3}$), quadrans ($\frac{1}{4}$), sextans ($\frac{1}{6}$), uncia ($\frac{1}{12}$)—a cumbrous coinage that needed wagons to transport it. It seems to be a clumsy attempt to apply the Greek institution of coinage to the bronze system of Italy. But very soon afterwards silver also was issued in the Roman name; its superior convenience was soon felt and, after the First Punic War at latest, it ranked as the chief metal in the Roman market.

The earliest Roman silver coins were didrachms struck on a standard familiar in Campania and issued in part at least in that district. They are coins of a normal Greek pattern and with the small token bronze that accompanies them, were clearly meant to circulate in districts accustomed to Greek coins—that is to say in Campania and its neighbourhood, Lucania and Bruttium and to some extent Samnium and Apulia. The coinage, whether we regard it as primarily military or commercial, certainly arose in the course of the great wars, which ended in making Rome supreme in Italy by about 270 B.C. It represents one result of the closer contact of Rome with the Greek south.

The *Aes Grave,* to a large extent, runs in series parallel to the silver, but can hardly have circulated in the same districts. It is simplest to regard it as the counterpart of the silver coinage, issued for Rome and her Italian allies, in North Italy, Latium, the Sabine country and, to some extent, Samnium and Apulia. As Haeberlin has demonstrated, Rome's first system of coinage is a dual one: it is only unified, when the more cumbrous Italic system yields to the Greek. Our knowledge of details is as yet very imperfect. There are variations in the weight of the *As* or pound, which do not answer to any obvious explanation; there is a reduction in the weight of the didrachm, which may or may not be due to inflation in the Pyrrhic War. We do not know how the didrachm and the As were related. Fortunately, the historical meaning of the coinage is clear. Rome began to open her doors to Greek ways and she was soon followed by her colonies in the South—Cales, Suessa, Teanum, which struck didrachms like hers—and by other colonies, in districts less Greek, which cast *Aes Grave*—Hatria in Picenum, for example, and Luceria in Apulia, or by independent cities such as Iguvium and Tuder in Umbria.

It was under the strain of the Punic Wars that Roman Republican coinage assumed the form in which we know it best. The denarius, traditionally assigned to 269–268 B.C., replaced the didrachm as the main Roman silver piece; it was equal in value to 10 asses, while its half, the quinarius, equalled 5, its fourth, the sestertius 2½. The As, originally a pound in weight, was reduced to about 5 oz.; then by slow descent to little more than 3 oz., again to 2 oz. and finally to 1 oz. Gold was issued on two separate occasions, as an emergency coinage—once in 217 B.C., once perhaps earlier. One fact, which has been obscured by modern writers, is the issue of *Aes Grave,* with the reverse type, in great masses during the First Punic War; Rome was short of silver and fell back upon her native Italian bronze and the strain of the war led to inflation, expressed in the reduction of the weight of the bronze unit, the As.

By the end of the Second Punic War Roman coinage had assumed its lasting form. The denarius was without question the master coin. Second to it in importance came a second silver piece, three-fourths of it in weight, the "Victoriate" or "Victory coin," struck for foreign trade in the Western Mediterranean, South Italy and the Adriatic. It may only have been introduced just before or during, the Second Punic War. The As, now reduced to one ounce, was a tenth of the denarius in value. Pliny has recorded a change of tariff to sixteen to the denarius in the Second Punic War, while admitting that the value of ten to one still held in the pay of the soldiers. As the coins themselves only show the new value much later, we are uncertain how far Pliny can be trusted. There was no gold coinage except in case of emergency.

The political supremacy of Rome in Italy afterward found expression in the supersession of all other Italian coinages, except a few of token copper in the South, by the Romans. This change did not take place very early or all at once—and favoured allies, such as Naples or Velia, probably coined in their own name longer than the Latin allies, with their closer bond with Rome: it was

probably hardly complete before the end of the Second Punic War.

In the great period of expansion after 200 B.C., denarius and victoriate went out to conquer the markets of the world. In the West progress was rapid, but the East, with its abundance of coinage, offered a successful resistance. Rome in her Eastern wars learned to use Eastern currencies, gold staters of Macedon and silver tetradrachms of Athens or Asia, and brought them into her own service: it was thus that she could dispense with any gold coinage and be content with a silver piece of less value than a shilling. About 135–130 B.C. the value of the denarius was raised to 16 asses, in place of 10, and, after a period in which the two values conflicted, that of 16 won the day (*c.* 100 B.C.). The great Social War of 91–89 B.C., when the Italian allies almost overthrew Rome in their eagerness to share her citizenship, led to confusion and inflation. The policy of the Gracchi, with its demands for land settlement and foreign colonies, had necessitated great issues of money, and, as early as 122 B.C. the senate had begun to inflate, by issuing base, plated denarii among the good ones. This policy was now vastly extended: the silver became so mixed and impure, that no one could tell what he really possessed. To add to the confusion the As was reduced from 1 oz. to ½ oz.; and, finally, in 87 B.C., the state declared itself bankrupt by ordering that all debts should be cleared at five shillings in the pound (*quadrans* for *As*). A praetor, M. Marius Gratidianus, attempted to find a remedy by sorting out the good denarii from the bad: at the same time, a new coinage of pure silver (theoretically pure, at least) was issued. Sulla, however, on his return and triumph, butchered M. Marius and annulled his policy, insisting that the money of the state must be accepted at its issue value: but, in future, the senate used its powers with strict moderation. The bronze coinage was allowed to sink into the background. The only further development of the Republic was the introduction of a permanent gold coinage by Julius Caesar, after previous experiments by Sulla.

The control of the coinage was in the hands of the senate, acting for the sovereign people; major changes had to be sanctioned by the passing of special laws. The responsibility for the striking of coins was normally entrusted to a special commission of three, "tresviri aere argento auro flando feriundo," but also, if less commonly, to other officials, such as quaestors or curule aediles. Roman coins were issued not only at Rome, but also at other mints in Italy and, later, in the provinces. But it is probable that these outside coinages were not at first administered in any way differently from the home and that issues outside Italy occur but rarely until the time of Sulla. In the period after Sulla these provincial issues became more and more important and less and less dependent on the senate. The generals abroad assumed the right to issue money to their troops in their own name and the senate raised no objection. In the end this military coinage of the provinces gave birth to the imperial coinage.

Roman coinage was historical in a sense in which modern coinage is not, but it is only late in the Republic that this element becomes strong. Rome began by placing on the obverse of her denarius the helmeted head of Roma, the protectress of the city and on the reverse, the Heavenly Twins, Castor and Pollux, who "fought so well for Rome" at the battle of Lake Regillus in 494 B.C. These types, with their somewhat general reference to Rome's divine protectors, remained in vogue for more than a hundred years. Variety first began in the reverse types, when figures of deities driving chariots began to replace the Dioscuri—Diana or Victory driving a biga or Jupiter or Apollo driving a quadriga. From about the time of the Gracchi an even greater freedom begins to prevail, and, extends to the obverse as well. In the succeeding period the types vary from issue to issue, with rare and passing revivals of traditional types. The choice is dictated by two considerations (1) the family pride of the moneyer, who selected incidents of interest from his family history (2) a natural interest in current politics, which leads the moneyer to select such types as can be brought into relation with current events.

A few examples will illustrate these tendencies. Sex. Pompeius Fostlus strikes a reverse, showing his ancestor Faustulus, the shepherd, finding the twins, Romulus and Remus, with the she-wolf; he probably strikes in the days of Tiberius Gracchus, when the thought of Roma Renascens, the "re-birth of Rome" was in men's minds—hence an appropriateness in the reference to her origins.

A group of moneyers of the year 118 B.C. issuing coins for the new colony of Narbo in Gaul, put on their reverses a Gallic warrior, probably Bituitus, king of the Arverni, in his war-chariot: in this case the public interest in Gaul has displaced any personal references. L. Tiburius Sabinus, striking *c.* 87 B.C., refers to the legendary Sabine king, Talicus, and to the rape of the Sabine women: the parallel between Rome's troubles with her neighbours in the past and in the present was obvious to all. Sulla, in the East, struck gold coins, with obverse types of Venus, whose favourite he claimed to be: later, in Rome itself, he commemorates his own triumph. Pompey the Great, perhaps in 61 B.C., struck a similar coin in honour of his Eastern victories, with a glance too at Africa, where his career of triumph had begun. The twenty years from 70 to 50 B.C. yield a host of references to history. M. Lepidus, probably the man who was afterwards triumvir with Octavian and Antony, has a gallery of family types, celebrating an earlier Lepidus, who at the age of 15 killed an enemy and saved a fellow-countryman in battle; the Marius Lepidus, who was sent to Alexandria to be tutor to King Ptolemy V. of Egypt in 200; the vestal virgin Aemilia, for whom Vesta miraculously rekindled the sacred fire; the Lepidus who restored the Basilica Aemilia and hung it with shields in 78 B.C. A. P. Hypsicus goes back still further to Neptune and his daughter, Leucronoe, the origin of his line.

With the outbreak of the great Civil War, the personal element burst out into full prominence. The coinage of Julius Caesar from the first bears the stamp of his personality and in the last year of his life the senate authorized him to place his portrait on the coins. Hitherto, the obverse of the coins had been considered the prerogative of a god or goddess: at the most, room might be made there for a hero of early days, such as Scipio Africanus. Caesar's own generation had begun to engrave the portraits of its fathers and now, at last, the portrait of the living man appears. Rome had come back to the monarchy, by whatever name she might call it. From this point to the end of the Republic, we have no true Republican coinage but only the preparations for the Imperial. Even the murderers of the tyrant Caesar in their last struggle for the Republic in the East, placed their own portraits on their coins. Brutus, on one famous reverse, set the daggers that had stabbed Caesar, with the comment EID. MAR. (the fatal Ides of March). Antony strikes in the East associating with himself first his wife in Rome, Octavia, later his Egyptian enchantress, Cleopatra. For his army and navy before the battle of Actium, he strikes denarii with the eagle and standards and prow on the reverse. Sextus Pompey, the pirate son of Pompey the Great, celebrates his chief naval victory over Octavian by a coin showing him as "son of Neptune"—proud title of a successful admiral.

The Roman bronze coinage never outgrew its conventional types. It grew to importance in the First Punic War, when the reverse represented the prow, the sign of sea power, the obverses the great gods of the state. These types it kept throughout: the ordinary Latin word for the "tail" of a coin is "navis" (ship).

Augustus.—The Empire, founded by Augustus, has a dual aspect; on the one side it is a monarchy, based on the support of the troops; on the other it is simply an exalted magistracy of the Roman Republic, created with special powers to deal with special problems. The imperial coinage faithfully mirrors this duality. The Emperor, as paymaster of the soldiers, keeps in his own hands the issue of the precious metals; but he leaves to the senate, now the one representative of the Roman people, the right of issuing the token coinage of brass and copper. The mint of the senate is naturally in Rome itself. The imperial mint is early centralised in the same place, but it is important to note that Augustus began by striking his money for the troops in the provinces, continuing the practice of the generals of the late Republic. His mint was not the successor of the senatorial, but

a new creation of his own. It was probably Caligula who opened the first mint in the capital. Henceforth gold and silver was normally struck in Rome. Provincial issues occur freely in times of civil war, but hardly to any extent otherwise. It was only in the 3rd century that a number of provincial mints came into being, to meet the needs of the chief armies, Antioch in Syria among the first. The example once given soon spread. By the time of Gallienus, imperial coins were struck in Viminacium, Siscia, Lugdunum, Mediolanum—perhaps at other mints too—as well as at Rome and Antioch; and from Aurelian on, the principle of the local issue of imperial coins is dominant. The senate struck mainly in Rome—at first only for Rome and Italy. The mark S.C., "senatus consulto," attests its authority. Antioch in the East and Lugdunum in Gaul also issue coins with this mark, which we must regard as also issued under senatorial authority. After the first two Emperors this coinage was probably current over the whole Empire; but it never played any large part in the East.

The commission of "tresviri" of the mint continued to exist as late as the 3rd century; but the names of these magistrates cease to appear on the coins before the death of Augustus. They may still have played a part in the senatorial issues; the imperial coinage fell within the range of the chief imperial officer of finance, the "a rationibus," and, under him, were administered by imperial procurators. The actual striking was entrusted to a staff of imperial freedmen and slaves. From an early date the Emperor began to exercise a controlling influence over the bronze token coinage also. The two mints may after a time even have been housed in the same building; at any rate the authority of the senate came to be more and more an empty form.

The Roman Republic had only known gold as an emergency or as a foreign coinage. Augustus from the first made his standard gold piece, the "aureus," the head of his system. The denarius however continued to be struck pure and of unimpaired weight; the coinage rested on a bi-metallic basis. The aureus weighed the forty-second part of a pound, the denarius the eighty-fourth; twenty denarii went to the aureus. The token coinage consisted of the sestertius and the dupondius, struck in brass, the fourth and the eighth part of the denarius respectively. The as, the fourth of the sestertius, and the quadrans, the fourth of the as, were struck in copper. Gold and silver were both struck almost pure. Base, plated denarii were not uncommon, but were the work of forgers. Under Caligula and Claudius, however, there is reason to think that the government abandoned its sound principles and condescended to make an unlawful profit by this device itself.

Later Imperial Changes.—Nero reformed the coinage, reducing the weight of the aureus to the forty-fifth part, that of the denarius to the ninety-sixth part of a pound. More important still, he added ten per cent of alloy to the hitherto pure silver. The relations of the coins to one another remained unchanged. Various more or less respectable motives for this reform have been suggested; and, so far as concerns the reduction of weight, there may have been justification for this measure of inflation. It is impossible to judge the debasement of the silver so charitably. It can be nothing but a device of a spendthrift government for meeting its obligations cheaply.

The evil consequences of Nero's debasement were slow to make themselves felt; but they were nevertheless disastrous. Again and again under stress of circumstances the government resorted to the same expedient. The percentage of alloy in the silver rose to as much as forty per cent under Septimius Severus.

Caracalla took the next step. He reduced the weight of the aureus to a fiftieth part of the pound and issued a new silver coin, the "antoninianus" or double denarius at the weight of about a denarius and a half. In the following period the aureus continued to decline in weight and the denarius, after a struggle, succumbed to the less honest double piece.

A final debasement of the silver by Gallienus at the crisis of his reign, when Valerian was a Persian captive and the West cut loose under an Emperor of its own, overtaxed the patience of a long-enduring public. The Antoninianus was no longer taken at its nominal value; confusion reigned and prices rose to absurd heights.

It was Aurelian, the "restorer of the world," who stabilized the coinage. The details of his work are obscure; what is certain is that his stabilization was so unpopular that it led to a riot, on the scale of a miniature civil war in Rome. A coin like the antoninianus was struck, but its value was reduced far below par. Gold was not restored on a reliable basis and the process of inflation began again. Diocletian had no choice but to deal summarily with this problem, before he could restore a coinage that deserved confidence.

Non-imperial Coinages.—In the West, local coinage in South Italy, Sicily, Gaul, Spain and Africa is found commonly under Augustus and Tiberius and sporadically, down to Galba. When this local coinage ceased, the duty of supplying the whole of the West fell on the mints of Rome, sometimes assisted by branches at Lugdunum (Lyons). In the East the case was very different. Coinage had been known there for so long, that the Romans found it expedient to leave a large part of the issues to local mints. Provincial silver or billon was struck in Asia, at Caesarea in Cappadocia, at Antioch in Syria, and at Alexandria in Egypt. Small change was issued freely not only in a number of provincial issues, but also at a vast number of city mints. It may fairly be said that the right to issue such small change was freely granted to almost every urban community. Under these circumstances the part assigned to imperial coinage was a restricted one. The aureus, indeed, had hardly a rival, the denarius circulated beside the provincial silver; but the token coinage in use was almost exclusively of local make. Not till late in the 3rd century did this local coinage succumb before the debasement of the imperial silver and the opening of provincial mints for imperial coin. The provincial coinage was, in its degree, a concern of the imperial government; the local coinage, however, was in theory independent. Its types are largely taken up with local interests; and, although reference to the Emperor or senate or people of Rome, is common, it is by no means universal and expresses a compliment rather than a definite acknowledgment of sovereignty.

Portraiture.—We have seen how under Julius Caesar interest in the living individual found expression on the coins in the form of portraiture. This tendency was developed to an immense degree under the Empire; but, as was only natural, interest was now focussed on the Emperor himself and the members of his family. Beside them there was no room for individual distinction. The Emperor, as head of the state, enjoys the right of portraiture on the obverse—a right which extended, at first sparingly, later more freely, to living Empresses or princes or to deceased members of the line. The reverse types, too, are full of his personality and his prowess. His victories, his triumphs, his distributions to the poor of Rome, his public shows, his measures for the welfare of Italy or the provinces, his arrivals and departures, his marriages, the birth of his heirs, his provision for the succession—these and many more, find constant reference on the coins. It is significant of the growth of imperial influence over the senatorial coinages, that, after a time, such reference is found as freely on the bronze coinage as on the gold and silver.

Religion still plays a large part. But even the great gods of the state are freely brought into connection with the Emperor and his protectors or as types of his qualities; and what is true of them is even more true of the minor deities, or virtues, who were so widely worshipped by the Romans. The virtues of the Emperor provide a symbolism fit to cover the whole of the imperial administration; his valour and victorious power, his care for the corn-supply of Rome, his spirit of constitutionalism, his liberality, his justice and his mercy. The coinage has throughout a strongly propagandist character. It serves to make known the achievements and to advertise the policies of the government.

The imperial system produced its own cult, the worship of those Emperors who, after death, were adjudged worthy of the honour of consecration. The worship of the "divi," as these deified Emperors were called, bulks large on the coins. They wear the radiate crown of the Sun-god as the symbol of their divinity;

while on the reverses appears the eagle, the symbol of the soul flown heavenwards, the pyre, the temple, or types of "Aeternitas," that world beyond time, conceived of as in the starry heavens, to which the soul of the good depart.

Diocletian.—Diocletian refounded the Roman Empire, but in a form that Augustus would hardly have recognized. The Emperor is now a monarch of the Eastern pattern, even in his lifetime receiving something like divine worship.

The mints formed a section of the department of the chancellor of the exchequer and, under him, were administered by "rationales." The moneyers, like so many other professions of the age of Diocletian, were organized as a rigid caste, from which escape was barely possible. They were subject to severe discipline and terrible penalties for abuses: but, despite this, false coinage was immensely prevalent and flourished in the face of repression.

Diocletian in A.D. 296 completed the task which Aurelian had begun. He finally cleared away the depreciated coinages of the 3rd century and issued a new coinage, based on sound gold and silver coins. His gold piece was struck at sixty to the pound of gold, his silver at ninety-six to the pound of silver. His successors continued his policy in the main lines unchanged. Constantine substituted the *solidus*, a piece of $\frac{1}{72}$nd of the pound, for Diocletian's sixtieth; this standard found general acceptance and passed on to the famous "besant" of the Byzantine Empire. In the first thirty-five years of the 4th century silver was very sparingly struck. When its free issue was resumed, new denominations, the *miliarense* ($\frac{1}{1,000}$ of the gold pound) and *siliqua* ($\frac{1}{1,728}$ of the gold pound) soon replaced Diocletian's ninety-sixth. The silver came more and more to be struck below standard weight—that is to say, to become a subordinate token coinage. The basis of the system was the steady supply of a standard gold coin.

Whether Diocletian and his successors issued a regular coinage in bronze or copper is very doubtful. They certainly continued to issue the very base billon, which represented the last stage of the debasement of the double denarius.

Diocletian's reform must have brought some improvement on the chaos of the great anarchy of the third century. But one great evil persisted—the cost of living remained high and would not come down. Diocletian's edict of A.D. 301 fixing maximum prices, was undoubtedly only one of a series of blows aimed at a recurrent social evil.

Influence of Christianity.—The spirit of the coinage undergoes a change, similar to that of its form. The divine Emperor dominates the entire coinage: even the gods hardly appear except as patrons of the new dynasty—Jupiter for Diocletian, Hercules for Maximian, Mars for Galerius, Sol for Constantius I. When Christianity, surviving the great persecution, received full tolerance and increasingly marked favours from Constantine, the pagan element in the coinage declined. Little of Christianity, however, took its place. For many years types and legends of a neutral character were preferred, though Christian signs and emblems—cross, monogram of Jesus Christ, *labarum* (Christian standard) begin to appear. There was in fact an unavowed truce between old and new. After Julian—who revived pagan types on his coins—notably the Apis bull of Egypt—the Christian element becomes stronger. The Emperor appears more and more as the defender of the faith, the imperial Victory shades off into the Christian angel. But the full development of the Christian tradition in coinage was reserved for Byzantium.

The Roman coinage of the East passes on without interruption into that of Byzantium. In the West, the Empire, succumbing to the barbarians in the late 5th century, left them its coinage as part of its legacy.

MEDIAEVAL AND LATER EUROPEAN COINS

With the fall of the Western empire, the coinage of the Byzantine empire became the great influence in European currency. The Byzantine period in coinage may be considered to begin in the reign of Anastasius. The coins are in the three metals, but the silver is rare, and was probably struck in small quantities. At first the gold and silver are fine, but, towards the close of the empire, much alloyed. The gold coin is the solidus of Constantine, with its half and its third (semissis and tremissis). The Byzantine solidus (besant) throughout the middle ages was the gold coin of European trade until the introduction of Italian gold in the 13th century. The chief silver coin was the miliarision, and a smaller coin, the siliqua or keration.

In 498 Anastasius introduced a new copper coinage, bearing on the reverse, the following marks of value in place of a type: M, K, I and E, 40 nummi, 20, 10 and 5. These coins bear beneath the values the abbreviated name of the place of issue. Justinian I. added the regnal year in A.D. 538, his twelfth year; this is the first appearance of annual dating on European coinage. The money of this class shows extraordinary variations of weight, which reflect the state of the imperial finances. Under Basil I. the bronze money to all appearances was reformed, but the absence of marks of value makes the whole later history of the coinage in this metal very difficult. There was one curious change in the shape of the money. Early in the eleventh century the solidus begins to assume a cup-shaped form, and this subsequently became the shape of the whole coinage except the smaller-bronze pieces. These coins are called *nummi scyphati.* The types, except when they refer simply to the sovereign, are of a religious and Christian character.

On the reverse of the oldest coins we have such types as a Victory holding a cross (other personifications all but disappear), but on those of later ones a representation of Christ or the Virgin Mary. Christ first appears on a coin of about A.D. 450, where He is represented marrying Pulcheria to Marcian. He does not appear again until the end of the 7th century, when His bust is introduced by Justinian II. From the 9th century Christ appears in various forms on the coins; about 900 we find the Virgin; a few years later saints, St. George, St. Michael, St. Theodore, etc., begin to appear. A remarkable type was introduced by Michael VIII. Palaeologus, who recovered Constantinople from the Latins in 1261, and issued coins with the Virgin standing in the midst of the walls of the city. Another notable type is the adoration of the Magi. The principal inscriptions for a long period almost invariably relate to the sovereign, and give his name and titles. The secondary inscriptions of the earlier coins indicate the town at which the piece was struck, and in the case of the larger bronze pieces, the year of the Emperor's reign is given. From about the 10th century there are generally two principal inscriptions, the one relating to the emperor and the other to the sacred figure of the reverse, in the form of a prayer. The secondary inscriptions at the same time are descriptive, and are merely abbreviations of the names or titles of the sacred personages beside the representations of whom they are placed. From the time of Alexius I. (Comnenus) the principal inscriptions practically disappear, and descriptive ones alone are given. These are nearly always abbreviations, like the secondary ones of the earlier period. The language of the inscriptions was at first Latin with a partial use of Greek; about the time of Heraclius Greek began to take its place on a rude class of coins, probably local; in the 8th century *Basileus* and *despotes* replace *Augustus;* by the 9th century Greek inscriptions occur in the regular coinage; and by the time of Alexius I. Latin has wholly disappeared. The Greek inscriptions are remarkable for their orthography, which indicates the changes of the language. In the 11th century we have a few metrical inscriptions, a practice commoner in Asia than in Europe. From the time of Justinian (6th century) onwards the profile which has been usual for centuries practically disappears from the coinage, and is replaced by a facing bust. The last Byzantine gold coin (a piece of John V., 1341–91) shows a figure of John the Baptist imitated from the Florentine coinage.

Cognate Groups.—Besides the regular series of the Byzantine empire, there are several groups connected with it, either because of their similarity, or because the sovereigns were of the imperial houses. These are the coinages of various barbarians, and the money of the emperors of Nicaea, of Thessalonica, and of Trebizond. The last groups consist of small silver pieces, which were prized for their purity; they were called Comnenian white-money (ἄσπρα κομνήνατα), the princes of Trebizond hav-

ing sprung from the illustrious family of the Comneni.

The coinage of the other states of the West falls into well-defined periods which have been distinguished as (1) transitional period, from Roman to true mediaeval coinage, *i.e.*, from the fall of Rome (476) to the accession of Charlemagne (768); (2) true mediaeval period, during which Carolingian money was the currency of Western Europe; this covers the period from Charlemagne to the end of the Swabian house in 1286; (3) early Renaissance from the first issue of the florin at Florence in 1252 to the beginning of the classical Renaissance in the middle of the 15th century; (4) the Renaissance and (5) modern period.

Mediaeval.—The main feature of the mediaeval period is the disappearance of gold and rise of silver and the return of gold from the 15th century onwards. The inconvenience of gold money when it represents a very large value in the necessaries of life must have caused its abandonment and the substitution of silver by the Carlovingians. The denier (denarius) or penny of about 24 grains was at first practically the sole coin. The solidus in gold was struck but very rarely, perhaps as a kind of proof of the right of coining. The Byzantine solidus or bezant was used and probably the equivalent Arab gold. The new coinage spread from France, where it was first royal and then royal and feudal, to Germany, Italy, where the Byzantine types did not wholly disappear, England, Scandinavia, Castile and Aragon. In Germany and France feudal money was soon issued, and in Italy towns and ecclesiastical foundations largely acquired from the empire the right of coinage, which was elsewhere rare. The consequence of the extended right of coinage was a depreciation in weight, and in the middle of the 12th century the one-sided deniers called bracteates appeared in Germany, which were so thin that they could only be stamped on one side. The types of this whole second coinage are new, except when the bust of the emperor is engraved. The most usual are the cross; and the church as a temple also appears, ultimately taking the form of a Gothic building. There are also sacred figures, and more rarely busts in the later age.

The great precursor of the Renaissance was the emperor Frederick II. (1215–50). In his restoration of the gold coinage he had already been preceded by the Norman Duke of Apulia, who for the convenience of these Arab subjects and for commercial reasons also had continued the gold coinage of the Fatimids, the great currency at that time of all the western Muslims. Roger II. (1130–54) also struck Latin coins of his own as DVX APVLIAE, the first ducats. Frederick II., continuing the gold standard, also struck his own Roman gold money, solidi and half solidi, with his bust as emperor of the Romans, Caesar Augustus, and on the reverse the imperial eagle, in keeping with the obverse title. In workmanship these were the finest coins produced in the middle ages. It is not till the great Swabian that we get the final establishment of a worthy coinage, a necessity of their large commercial schemes. The famous gold florin was first issued in 1252 and at once became popular. The obverse type is the standing figure of St. John the Baptist, the reverse bears the lily of Florence. The weight was about 54 grains, but the breadth of the coin and the beauty of the work gave it dignity. The commercial greatness of Florence and the purity of the florin caused the issue of smaller coins in almost all parts of Europe. Venice was not long in striking (in 1248) a gold coin of the same weight as the florin, but with the types of a standing figure of Christ, and the doge receiving the gonfalon at the hands of St. Mark, a type suggested by Byzantium. It was first called the ducat, the name it always bears in its inscription; later it is known as the zecchino or sequin. Though not so largely imitated in type as the florin, the extreme purity of the sequin made it a world currency down to the 19th century. Genoa likewise had a great gold currency, and the other Italian states struck in this metal. Many varieties of gold money appear in course of time in France, England and to a less extent in other countries. The need for heavier silver coinage caused the issue of the large denier (grossus denarius, gros or groat). This coin appears early in the 14th century. The types from the 14th century onwards are many and distinctly worthy of the art of the time, which as yet is purely decorative and conventional, so that portraits are not possible. The religious intention also is gradually giving way to the desire to produce a beautiful result, and the symbol of the cross is varied to suit the decorative needs of the coin. Heraldic subjects also appear, and in the shield, which is frequently a reverse type, we see the origin of the usual modern reverse of the most important coins.

With the classical Renaissance we find ourselves in the presence of modern ideas. It is a period of innumerable small states and kingdoms with no uniformity of coinage yet most modern series can be traced back to it. Its most remarkable characteristic is the revival of portraiture and from the 16th century with the opening of the new world the enormous increase in output of coins in gold and silver. With the institution of the German thaler in 1518, it speedily became the chief European piece in its metal, and to its popularity is no doubt due the large silver pieces of other countries—crowns, ecus and scudos.

In the west a number of coins carry on the Roman tradition. They cover the period from the 5th to the 8th centuries, and are of considerable historical significance. The types throughout are monotonous: the bust of a Roman emperor or local ruler, a cross of some kind, a Victory, etc. The style is quite barbarous. The classification of the earliest servile imitations of Roman and Byzantine money rests only on origin and is uncertain.

The following general series are distinguished: (A) The Vandals (Africa, 428–534) issued gold (?), silver and bronze from Hunneric (477–84) to Gelamir (530–34); the gold is anonymous. (B) The Suevians (Spain, 409–585) had little but imitations of Byzantine gold; but Richiar (448–456) issued a denarius in his own name. (C) The Ostrogoths (Italy, 489–553) were preceded by the Herulian Odoacer (476–94), who coined silver and bronze; their kings (including Theodoric, 493–526, and Totila or Badulla, 541–52) issued gold, silver and bronze in their own names, from Rome, Ravenna, Milan, etc. (D) The Lombards (Italy, 568–774) had no coins in their own names before Grimoald, duke of Beneventum (662–71); later there are gold solidi and thirds and silver from many mints. Gold was issued for the duchy of Beneventum in the 8th century. (E) The Burgundians (Gaul, to 534) first issued recognizable coins under Gondebald (473–516). (F) The Visigoths (South Gaul and Spain) had imitative gold thirds in the 5th and 6th centuries; the kings' names appear from Leovigild (573–586) to Roderic (710–11). Sixty-one mints were in operation. (G) The Meroving Franks first issued under Clovis I. (481–511) coins recognizably Frankish (solidi and thirds). Royal names first appear on silver and copper under Theoderic of Austrasia (511–34) and Childebert I. of Paris (511–58). The chief Frankish inscribed coinage is, however, of gold solidi and thirds, from Theodebert I. (534–48), who broke down the Roman imperial prerogative and issued gold with his own name in full, to the beginning of the 8th century. The last Merovingians issued no coins in their own names, being mere puppets. From the middle of the 6th century the coins with kings' names are far less numerous than those bearing the names only of mints and moneyers; some 800 places (not only in what is now France, but in Germany, the Low Countries and Switzerland) are thus named. This coinage seems to have been intimately connected with the fiscal organization, though the generally accepted theory that the taxes collected in each place were there and then converted into money is by no means proved. Certain religious establishments also possessed the right of coining in their own name. The close of the Merovingian dynasty saw a revival of silver in the *saiga,* which heralded the introduction of the denier. (H) In England the Anglo-Saxons began with an imitative coinage similar to the Merovingian, viz., gold, *solidi* and *thirds,* and silver *sceattas* of about 20 grains troy, and *stycas,* first of silver, then of copper. The gold is rare and confined to the south; only two *solidi* are known, imitations of Honorius, with Runic legends on the reverse.

Portugal.—The coinages of the various countries of Europe from the end of Roman coinage and its imitations can be briefly mentioned in geographical order from west to east. The money of Portugal begins, after the expulsion of the Moors, with Alphonso I. (1112); it is exclusively regal, and not of great interest except as affording indications of the wealth and commercial activity of the state in the early part of the 18th century.

The early golds are of interest as by the arrangement of their type and inscription they try to look as like Moorish coins as possible.

Spain.—The coinage of Spain, after the reconquest from the Moors, is almost without exception regal. The Kingdom of Navarre had a coinage from the time of Sancho III. (1000–35). The series of Castile and Leon begins with Alphonso VI. (1053) with deniers and obols. Aragon first has coins under Sancho Ramirez I. (1063). Gold (as in Portugal imitated from Moorish money) is introduced in the middle of the 12th century. A plentiful coinage was issued after the union of the crowns in 1479. The Spanish dollar of the 17th and 18th centuries was one of the most widely circulating currencies in the West.

France.—In France in 755 Pepin the Short abolished the gold coinage of his Merovingian predecessors and introduced the silver denier (denarius=penny); the coinage became a royal prerogative once more and confined to a few mints. The denier, which at first weighed *c.* 1·28 gramme (19¾ grains), was for centuries the chief of European silver coins. Under Charlemagne the weight was slightly raised; the Caroline monogram appears and there are other modifications in the types. Charlemagne also issued money from various Italian, German and Spanish mints. He also introduced the obol, and struck gold (chiefly at Italian mints). Among his types must be noted the temple with the inscription XPISTIANA RELIGIO. Louis le Debonnaire (814–840) was the last Carolingian to strike gold. In the 9th century are perceptible the first traces of the movement which led to the extensive feudal coinage. The advent of the house of Capet made no great change in the system, but the feudal issues now become important. The most widespread denier was that of the abbey of St. Martin at Tours (*denier tournois*); the royal coinage was known as the *monnaie parisis*. Louis IX. (1226–70) effected a great reform late in his reign, making the sou (hitherto a money of account) into a real coin as the *gros* and introducing a gold coinage. Henceforward the coinage increases in complexity; in the 14th century it has great artistic merit, especially the gold; from the end of the 16th century it becomes conventional.

Belgium.—Passing on to Belgium, its coinage, which, except for the few mints operating under the Merovingians and Carolingians, does not begin until the 11th century, comprises many pieces struck by foreign rulers, and has little of an independent character in either the regal or the seignorial class. The most important coinages are those of the house of Burgundy and Charles V. and his son, and of the bishops of Liége. The coinage of Belgium approaches the French on the one side, the German on the other.

Switzerland.—The multitudinous coinage of Switzerland illustrates the varying fortunes of this central state, and its gradual growth and consolidation. First we have the gold money of the Frankish kings, among whose mints Basel, Lausanne, St. Maurice-en-Valais and Sitten (Sion) already appear. The silver deniers, which Charlemagne made the coinage of the empire, are issued by fewer mints; the dukes of Swabia began to strike at Zürich in the 10th century, and the empire granted during the 10th and down to the 13th century the right of coinage to various ecclesiastical foundations, bishoprics and abbeys. Bern was allowed a mint by the emperor Frederick II. in 1218, and other towns and seigneurs subsequently gained the same right. The demi-bracteate appears about the middle of the 11th century, and about 1125 is superseded by the true bracteate, which lasts until about 1300. The 14th century witnessed the rise of the Swiss confederation, and by degrees the cantons struck their own money. These, together with the coins of some few sees and abbacies, form the bulk of Swiss money of the mediaeval and modern periods. The separate cantonal coinage, interrupted by the French occupation, was finally suppressed in 1848, when a uniform currency was adopted.

Italy.—Italy, with Sicily, has special features. Here the barbaric coinages were mixed with the Byzantine issues which marked the recovery of the Eastern empire, and left a lasting influence in the north at Venice, and in the south at Beneventum. Later the Arab occupation of Sicily and the predominance of Arab coins left their mark in the curious Oriental coinages with Arabic inscriptions of the Normans of Sicily and of the Emperor Frederick II., mixed after his fashion with Latin coinage. The earliest money is that of the barbarian Ostrogoths and Lombards, and local Byzantine issues in Sicily. This is followed by the deniers of Charlemagne and his successors, succeeded by the gold currencies of the Normans and Frederick II. The age of the free cities is marked by the great coinages of Florence, Venice and Genoa, while the Angevin and Aragonese princes coined in the south, and the popes began to issue a regular currency of their own at Rome. The Italian princes of the next period coined in Savoy, and at Florence, Modena, Mantua and other cities, while Rome and the foreign rulers of the south continued their mintages, Venice and Genoa of the republics alone surviving.

The money of Florence, as may be observed, is disappointing in its art, for the great commercial currencies have to be conservative. The silver florin was first struck in 1189. It is heavier than the denier, weighing about 27 grains, and bears the lily of Florence and the bust of St. John the Baptist. These are thenceforward the leading types, the flower never changing, but the representation of the saint being varied. On the gold florin, first issued in 1252, the Baptist is represented standing, while in the contemporary silver florins he is seated. The latter have a rhyming legend, "Det tibi florere Christus, Florentia vere."

Venice as a mint rivals Florence in conservatism, and the early style is distinctly Byzantine; commercial reasons had to prevail in keeping coin types unchanged even in a great artistic city. The famous Venetian zechino or sequin, the rival of the florin of Florence, appears to have been first issued under Giovanni Dandolo (1284). On the obverse St. Mark gives the gonfalon to the kneeling doge, and on the reverse is a standing figure of the Saviour within an oval nimbus and a rhyming legend, "Sit tibi, Christe, datus Quem tu regis, iste ductus."

The series of the coins of Rome is rather of historical than of artistic merit. The popes begin to strike money under Adrian I. (A.D. 772–795), whose deniers are in a Byzantino-Lombard style. The coins of his successors, excepting few, down to Leo IX (1049) associate the names of pope and emperor. From Leo IX to Urban V (1362) there is no papal coinage. The Roman senate strikes from 1188 onward. We then see on the silver the style of the senate and Roman people, and ROMA CAPUT MUNDI. Some coins have the figures of St. Paul and St. Peter, others Rome seated and a lion. Charles of Anjou, King of Sicily (1263–85), strikes as a senator, and Cola di' Rienzo (1347–48) as tribune. The gold ducat of about 1300 imitates the types of the Venetian sequin. St. Peter there gives the gonfalon to a kneeling senator. The arms of the moneying senator next appear in the field. The papal coinage is resumed at Avignon; and Urban V, on his return to Rome, takes the sole right of the mint. From Martin V (1417) to Pius IX there is a continuous papal coinage. The later coins, though they have an interest from their bearing on the history of art, are disappointing in style. We have beautiful gold coins of Giovanni Bentivoglio, lord of Bologna, who employed Francia at his mint, and we know that the artist remained at his post after Julius II had taken the city. There are also pieces of Clement VII by Cellini, vigorous in design but careless in execution. There were papal mints at Ancona, Bologna, Piacenza, Parma, Ferrara and other Italian towns; and coins were also struck at Avignon from 1342 to 1700. When the Vatican City state was created in 1929 it was accorded the right of issuing its own coinage.

The coinage of Sicily, afterward that of the Two Sicilies, or Naples and Sicily, begins with the Normans. Theirs is a curiously mixed series. It begins with Robert Guiscard as duke of Apulia (1075) and Roger I of Sicily (1072). The gold money is almost wholly Arabic though Roger II struck the Latin ducat, the earliest of its class; the silver is Arabic, except the great Latin scyphati of Roger II with Roger III; the copper is Latin and Arabic. The gold series (*Augustales*) of the emperor Frederick II (1198–1250) shows the first sentiment of reviving classical art, its work far in advance of the age. These are Latin coins; he also struck small Arabic pieces in gold.

Under Conrad and Manfred there is little coinage, copper only, but with Charles I of Anjou (1266–85) the gold money in purely mediaeval style is beautiful, quite equal to that of his brother,

St. Louis of France.

After this time there is a great issue of gigliati, silver coins with, for reverse, a cross fleurdelisée cantoned with fleur-de-lis.

Germany.—The money of Germany, with which we include Austria and Hungary is, like that of Italy, far too varied for it to be possible here to do more than sketch some of its main features. In the Frankish period mints were in operation at cities in the west, such as Mainz, Strassburg, Speyer, Treves, Worms, Cologne. Pepin issued denarii from Strassburg and Mainz; under his successors denarii and obols were also coined at other mints, as Bonn, Cologne, Spires, Treves. After the reign of Louis the Child (910–11) the Carolingian system was continued until the advent of the Swabians with Conrad III. (1138–52). In the succeeding period which ends with the introduction of the grossus and the gold coinage under Louis of Bavaria (1314–47), the uniformity of the currency disappears. In the west (in Lotharingia, including the southern Low Countries, the Moselle and Rhine-lands, in Frisia, Bavaria, parts of Franconia and Swabia) the denier continues; but elsewhere we find the bracteate. The right of coinage is acquired in an increasing measure by the feudatories of the empire. With the introduction of the regular gold coinage (consisting for the most part of florins) and the grossus in the 14th century, Germany enters on the modern period. From the 16th century the thaler (so called from Joachimsthal in Bohemia, where the counts of Schlick first struck the coin in 1518) dominates the silver currency. The thalers and other large coins of the 16th and 17th centuries are often good and always vigorous in workmanship. By the convention of 1857 the thaler was recognized as the unit for Berlin and the north, the florin of 100 kreuzers for Austria, the florin of 60 kr. for the south. A uniform system, based on the gold reichsmark of 100 pfennigs, was established all over the German empire in 1876. Of particular currencies in Germany we must be content with the mention of some of the more important. Among the great rulers we note the dukes of Bavaria, who coined from Henry I. (948–55), and issued fine thalers in the 16th century. The Counts Palatine of the Rhine coined from 1294, their mints being at Heidelberg, Frankfort, etc. The Saxon coinage begins with Duke Bernard (973) and includes a large series of bracteates and thalers, the latter being especially famous. The Brunswick coinage begins in the 11th century; besides its bracteates we note the large mining-thalers of the 16th and 17th centuries (up to ten thaler-pieces). There are good bracteates and thalers of the margraves of Brandenburg; from 1701 they coin as kings of Prussia. In Austria there is a ducal coinage from the 12th century; the gold florin of Florentine character appears under Albert II. (1330–1358). The marriage-coin of Maximilian and Maria of Burgundy (a 16th-century reproduction of a medal made by the Italian, Candida in 1479) is a striking piece, and in the 16th century there is a large series of fine thalers. The thalers of Maria Theresa became popular on either side of the Red Sea, and those of the date 1780 are still recoined for trade there. In Bohemia there is a ducal coinage from the early 10th century to 1192; then came the regal bracteates. Wenceslas II. (1278–1305) struck the first German grossus at Prague. The gold florin made its appearance under John of Luxemburg (1310–47). In Hungary the regal coinage begins with St. Stephen (1000). Charles I. of Anjou (1310–42) introduced the florin and grossus. Of historical interest is the money of John Hunyadi as regent (1441–52). The abundance of gold about this time and later shows the metallic wealth of the land. The same is true of the rich gold coinage of the Transylvanian princes in the 16th and 17th centuries. Of ecclesiastical coinages the most important are at Münster, Cologne, Mainz, Treves, Augsburg, Magdeburg, Spires, Würzburg, Salzburg. The Cologne series of coins is almost continuous from the Frankish period; the archbishops first received the right from Otto I., Brune (953–65) being the first to coin; from Pilgrim (1021–36) the series, issued at various mints in the Rhineland, is very complete down to 1802. The series of Treves ranges from Theodoric I. (965–75) to Clement Wenceslas (1794). The archiepiscopal coinage of Mainz begins with Willigis (975) and lasts until 1802; its mints included Erfurt, Bingen and many other places. The Salzburg series (beginning 996) is remarkable for its fine thalers (especially of Mathias Lang, 1519–1540). The patriarchs of Aquileia, who may be mentioned here, acquired the right of coinage from Louis II. in the 9th century, but the first who can be identified on the coins is Godfrey (1184); thence onwards there is an interesting series of denarii and smaller coins down to the early 15th century. Of cities with large coinages it is sufficient to mention Aix-la-Chapelle (from the time of Frederick I. to 1795), Frankfort-on-the-Main, Hamburg (with great gold pieces of the 16th and 17th centuries, up to 10 ducats) and Nuremburg.

Scandinavian Countries.—The origin of the coinage of the Scandinavian states: Norway, Denmark and Sweden, is clearly English and due to the Danish conquest of England. The Runic alphabet is employed, though not by any means exclusively, on many of the early coins of Denmark and Norway. The Norwegian series begins with Hakon Jarl (989–96), who copies the pennies of Aethelred II. In the second half of the 11th century begins a coinage of small, thin pennies, which develop into bracteates. Magnus IV. (1263–80) restores the coinage, more or less imitating the English sterlings of the time. Norway and Denmark were united under Eric of Pomerania in 1396. The money of Denmark begins with pennies of Sweyn (985–1014) which are copied from the coinage of Aethelred II.; the coins of Canute the Great (1014–1035) and Hardicanute (1036–42) are mainly English in character. With Magnus (1042–47) other influences, especially Byzantine, appear, and the latter is very strong under Sweyn Aestrithson (1047–76). Bracteates come in in the second half of the 12th century. The coinage is very difficult of classification until the time of Eric of Pomerania (1396). There are important episcopal coinages at Roskilde and Lund in the 12th and 13th centuries. Sweden has very few early coins, beginning with imitations of Olaf Skötkonug (995) of English pennies and showing the usual bracteate coinage. The money was restored by Albert of Mecklenburg (1363–87). The thaler is introduced by Sten Sture the younger (1512–20). The money of Gustavus Adolphus is historically interesting. Under Charles XII. there is highly curious money of necessity. The daler is struck as a small copper coin, sometimes plated. The types include the Roman divinities. At the same time and later there was a large issue of enormous plates of copper, stamped with their full value in silver money as a countermark.

Russia.—The earliest Russian coinage begins with the princes of Kiev as early as the end of the 10th century; it shows strong Byzantine influence. The grand princes from the early 15th century struck curious little silver pieces. The coinage was modernized by Peter the Great, who introduced a regular gold coinage. The large silver and copper coins of his successors are very plentiful. Nicholas I. (1825–55) introduced a platinum coinage of about two-fifths the value of gold.

Other Countries.—The Christian coinages of the northern Balkan States are of great morphological interest. They are chiefly silver grossi, showing a mixture of Byzantine and Venetian influences. The Bulgarians had a regular silver coinage from Asien I. (1186–96) to John Sismana (1371–95). The Serbian coinage lasts from Vladislas I. (1234–40) to the middle of the 15th centurv. There is also a coinage of the Bans of Bosnia (late 13th to 15th century). The modern coinages of the Balkan States are of the 19th century only. The independent city of Ragusa is remarkable for the bold style of its early copper (13th century, inspired by Roman models of the 4th century) and the richness and variety of its later issues.

BRITISH COINS

The earliest coins struck in Britain were rude uninscribed imitations of the stater of Philip II. of Macedon (359–336 B.C.), one of the great currencies of the ancient world; they reached Britain through Gaul where they had been imitated by the various tribes there. The exact distribution of the earliest coins of this type found in Britain between British and Gaulish mints is still uncertain. These coins are of gold of gradually diminishing purity and are at first uninscribed. Under Roman influence we have the introduction of silver and copper coins toward the end

of the last century B.C.; inscriptions also now appear on the coins so that we can identify the coinage of Tincommius and Cunobelinus (Cymbeline) and others known and unknown to history. With the Roman conquest native coinage disappears and if we except the Roman coins from the mint of London in the 3rd and 4th centuries A.D., we have no British coinage again till the departure of the Romans. Gradually degenerating copies of Roman types formed the currency of Britain from the 5th to the 7th century, when we are once more able to attribute the coins to definite rulers. In the 7th century we have the extensive coinage of little silver pieces known as "sceats" with a considerable variety of types and legends in Runic letters, which enable some to be attributed, for example, to Peada, king of Mercia (655–57 A.D.).

About the same time in the kingdom of Northumbria we have the small copper coins known as "stycas," which record a long series of kings from Ecgfrith (670–85) onward. But it is from the reign of Offa (757–96) who introduced the silver "penny" that English coinage may be said to date. In its broad flat fabric, contrasted with the thick fabric of its predecessors, it shows the influence of its Carolingian prototype but the designs are thoroughly Anglo-Saxon and the portrait of Offa, a remarkable piece of work, reaches a level not equalled again in English coinage till the reign of Henry VII. The inscriptions, obverse name of the king and reverse that of the moneyer, were to remain unchanged in form till the reign of Edward I; for the same period also the silver penny was the only English coin. A remarkable coin struck by Offa is his imitation of an Arab dinar of the Caliph al-Manṣūr with the additional legend OFFA REX, one of the few and exceptional gold coins of the Anglo-Saxon period. About the same time we find the Archbishops of Canterbury beginning to issue coins, the earliest being those of Jaenberht (766–90) bearing the names of the suzerain Offa also.

The kings of Kent and the kings of East Anglia also began to strike pennies: the rise of Wessex after the battle of Ellandune in 825 can be traced in the coinage; the earliest coins of Wessex were those struck at Canterbury by Ecgberht and his conquest of Kent, and the mints of Alfred's reign reveal how West Saxon power had expanded. The Danish invaders have also left extensive numismatic records, some of exceptional historical interest like the London coinage of Halfdan. The troubled state of the country is reflected in the many barbarous and hurriedly struck coins of this period. The peace and prosperity which returned after the peace of Wedmore (878) is seen in the improved workmanship of the coinage, with a more careful treatment of the portrait and a great variety of original work in the reverse types, a feature which was not long maintained. In the 10th century it became the regular practice to add the name of the mint as well as that of the moneyer on the reverse. In the edicts of the Council of Greatley (928) we have the earliest surviving mint ordinances. Coins were only to be struck at certain towns and each town was to have only one moneyer with certain specified exceptions (*e.g.*, eight for London). The number of mints increased till in the reign of Aethelred II we have more than 70; from about his time also the king's portrait, which had only been occasionally used, became the regular obverse type on the coinage, while the reverse type also became stereotyped to some form of cross.

The Norman conquest made no change in the coinage or mint system and we even find that preconquest moneyers stayed in office and struck coins for William I. But the coin-types were now regularly changed partly as a source of revenue, for the moneyers had to make a payment when new dies were issued, partly as a check on forgery. The dies were made in London and sent to the country mints. The pennies of William II have nothing in their legend to distinguish them from his father's issues but students have been able to allot eight types to William I and five to his son. Forgers gave Henry I much trouble and one step he took to prevent it was to issue his later coins with a snick in the edge to show that the silver was good. The civil wars of Stephen's reign produced many interesting coins such as those struck in Matilda's name and the pennies of Eustace Fitzjohn and other barons.

Henry II ceased the practice of regularly changing the types which had been the custom since William I's reign and struck one type till 1180. In this type the work of the English mints reached its lowest level; the coins frequently have only a letter or two of the legends and fragments of the type. His second type, the "short-cross," so called from its reverse design, first issued in 1180, remained unchanged—including the name Henricus—not only by Henry II but also by Richard and John and Henry III till 1247. In 1247 Henry III coined the "long-cross" penny with the arms of the cross extended to the edge of the coin with a view to preventing clipping. He also reduced considerably the number of mints. In 1279 Edward I introduced a new type of penny obverse: bust of the king and reverse: long cross with three pellets in each angle, a type which was much imitated abroad and persisted in the silver coinage till the reign of Henry VII. The moneyer's name disappeared from the reverse legend and its place was taken by the name of the mint CIVITAS LONDON, etc. He also struck halfpennies and farthings to replace the cut pennies which had hitherto done duty for small change. He also introduced a groat or fourpenny piece (groat=gros=*grossus*, large *denarius*-penny) but the time was not yet ripe for this larger coin and it did not establish itself till Edward III's reign. The coins of Edward I, II and III cannot be distinguished by their legends; a minute study of them has, however, enabled them to be attributed satisfactorily.

Henry III had attempted to issue a gold coinage by striking the gold penny of the value of 20 pence silver, later raised to 24, but the difficulty of rating gold to silver proved insuperable and the coinage was withdrawn. In 1344 Edward III with the issue of his fine series, the florin, leopard and helm ($\frac{1}{2}$ and $\frac{1}{4}$ florin) again attempted without success to introduce a gold currency: the attempt was renewed with the noble and after various experiments with its weights a gold coinage was finally established in currency in 1351 with a noble of 120 gr. of gold and its subdivisions the half- and quarter-noble. The silver penny was reduced to 18 gr. and the groat first issued in the same year. The noble was valued at 6*s.* 8*d.* The obverse type of the noble, the king in a ship, is supposed to allude to the naval victory of Sluys. The reverse type is a floreate cross with considerable ornamentation. Edward IV distinguished his noble by a rose on the ship (rose-noble or ryal) and raised its value to 10*s.*, while a new gold coin, the "angel," was introduced to replace the old value of the noble at 6*s.* 8*d.*; the penny was reduced to 12 gr.

The angel is so called from its type of St. Michael and Lucifer. The reverse is a ship with a cross in front of the mast. The angel in the 16th century became the piece given to those touched for king's evil; it was struck for this purpose down to the reign of Charles I; it was not again issued as legal tender but small copies of it were struck by the later Stuarts and pretenders for presentation at the ceremony of touching for king's evil. The next important change in the coinage was not till the reign of Henry VII. This was the introduction of the sovereign, a large gold coin of 240 gr. current for 20*s.*; the obverse type was the king seated in an elaborate throne and the reverse a Tudor rose with a shield of arms in the centre. The same ruler also issued the first English shilling or testoon, a handsome coin with a fine portrait, in 1583, but this did not attain much currency. Henry VIII altered the types of the smaller silver coins by replacing the three-centuries-old cross and pellets by a long cross and shield while the inscription POSUI DEUM ADJUTOREM MEUM took the place of the mint legend; the stereotyped bust was replaced by an excellent profile portrait on the groat and the seated king on the penny; Henry VIII debased the gold and reduced the weight of the sovereign, the reverse type of which was now the royal arms supported by a lion and dragon. He introduced the gold crown of 5*s.* and half-crown and raised the angel to 7*s.* 6*d.*, introduced the George noble to take its old value of 6*s.* 8*d.*—so called from its type of St. George and Dragon. In 1544 he issued the base shilling or testoon of 12 pence and debased the silver coinage. It was in his reign that the archiepiscopal mints of Canterbury, York and Durham were abolished, the former having exercised its privilege for

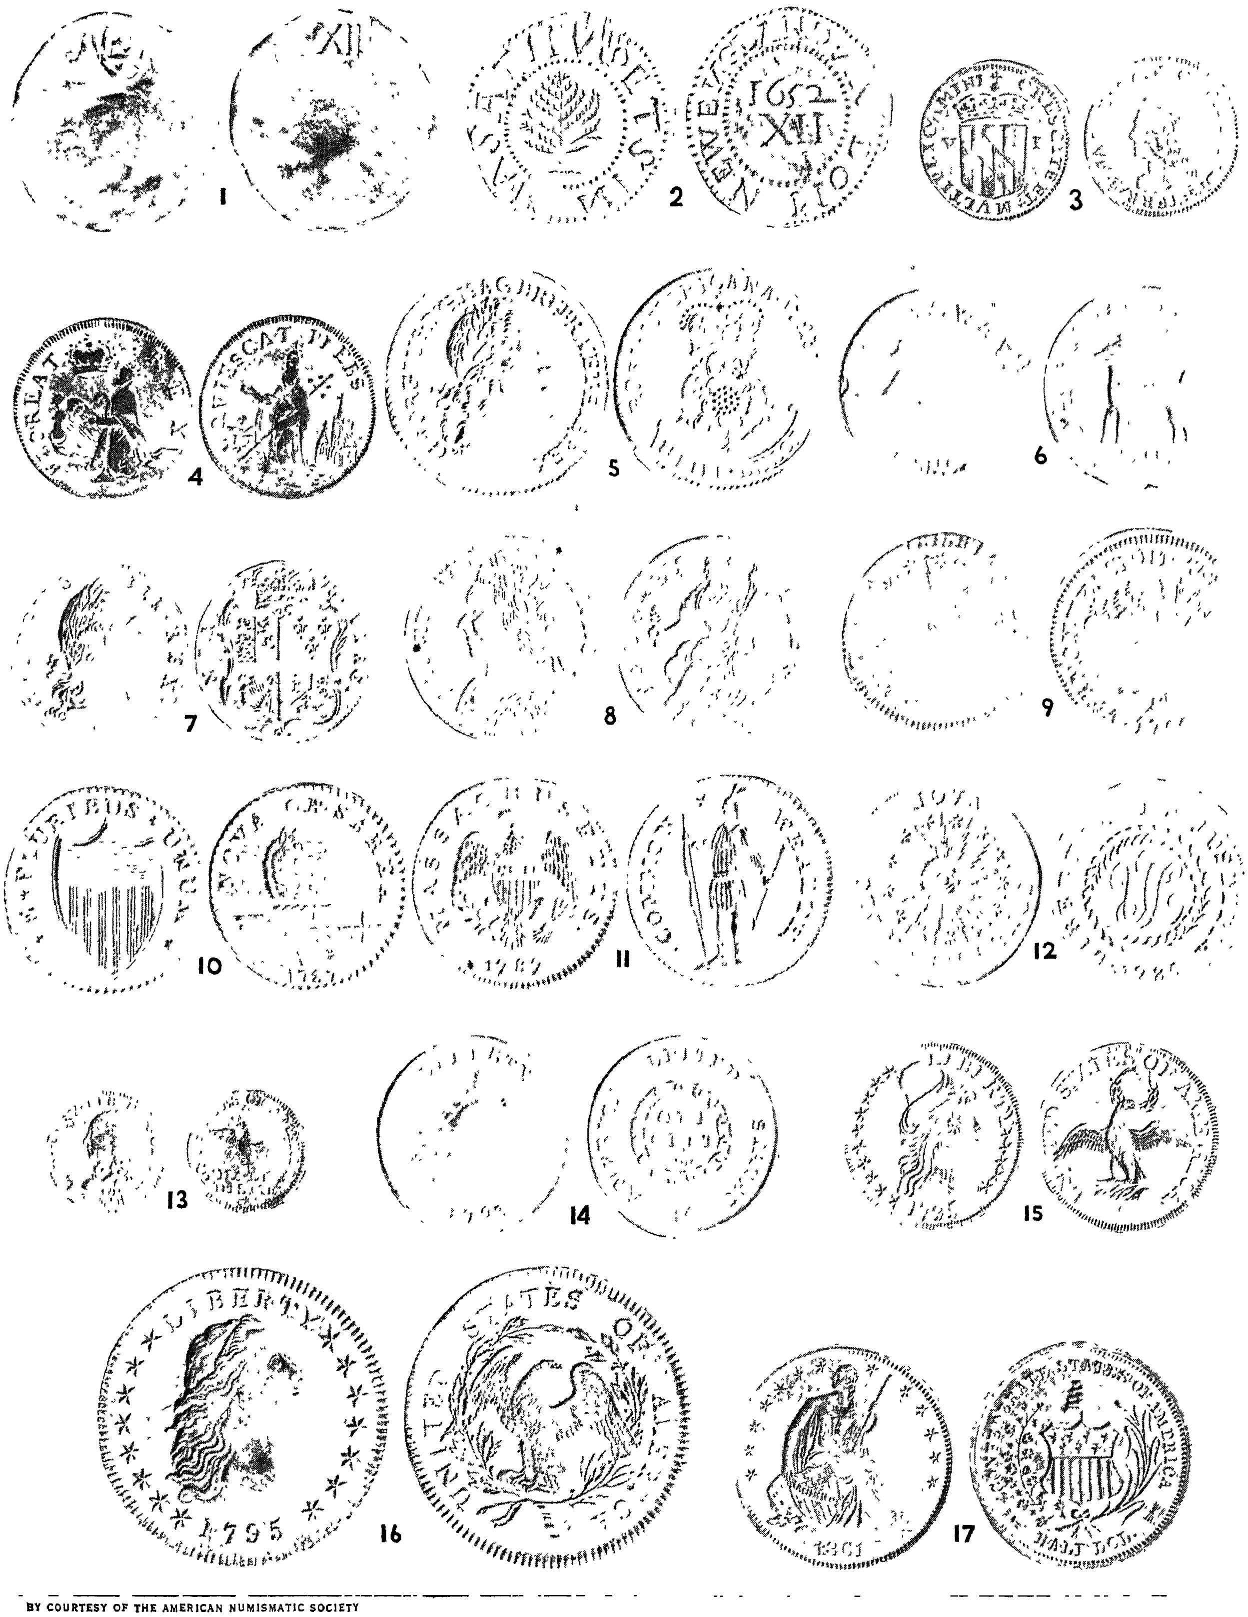
ANCIENT AND MODERN ORIENTAL COINS

1–13. INDIAN. 1. Tetradrachm of Menander. Graeco-Indian, *c.* 2nd–1st century B.C. 2. Stater of Kanishka. 3. Punch-marked, *c.* 3rd century B.C. 4. Western satrap. Silver, 1st century B.C.–4th century A.D. 5. Samudragupta, 4th century. 6. Samantadeva. 7. Govindachandra. 8. Chera, mediaeval. 9. Massa of Ceylon, *c.* 1200. 10, 11. Mahmud of Ghazna, 11th and 12th century. 12. Sher Shah rupee. 13. Mohur (gold) of Akbar. 14. ANNAM. Tu Duc, 1847–83. 15–17, 20. CHINESE. 15. Five-chu piece (copper), *c.* A.D. 500–550. 16. Kai Yuan, A.D. 618–627. 17. Hsien Feng, struck for Chinese Turkistan. 20. Republic. 18–19, 21. JAPANESE. 18. 2 *bu* piece (gold). 19. Sen. 21. Modern gold 10-yen piece

NUMISMATICS



BY COURTESY OF THE AMERICAN NUMISMATIC SOCIETY

EARLY AMERICAN COLONIAL AND UNITED STATES COINS

1. The New England shilling, the first coin made by the colonists. Struck in Massachusetts. 2. The Pine Tree shilling, 1652. Made by John Hull in Boston. 3. The Lord Baltimore sixpence. Made in England for Maryland about 1659. 4. The St. Patrick farthing brought from Ireland by Mark Newby in 1681 and used in New Jersey. 5. The Rosa Americana twopence made in England for the American Colonies in 1722 and 1723. 6. A copper token made about 1737 by John Higley at Granby, Connecticut, to pass for threepence. 7. A halfpenny made in England for Virginia in 1773. 8. A cent made by the State of Connecticut from 1785 to 1788. 9. A cent made by Vermont in 1785 and 1786. 10. A cent made by New Jersey from 1786 to 1788. 11. A cent made by Massachusetts in 1787 and 1788. 12. The Nova Constellatio cent made for the United States in 1785 before the Mint was established. 13. The half disme, 1792. One of the first coins made in the Mint, and said to have been made from silver furnished by George Washington. 14. The first type of cent, 1793. 15. The first type of half eagle (five dollar gold piece). 16. The first type of the silver dollar. 17. The Confederate half dollar. Four only were made at the New Orleans Mint

FIFTEENTH, SIXTEENTH AND SEVENTEENTH CENTURY MEDALS

1. John VII., by Pisanello, 1438
2. Christoph Tetzel, by M. Gebel, 1528
3. Vittorio Gambello, by himself, 1508
4. Giovanni Toscani, by Lysippus
5. Edwara Courtney, by Pastorino, 1556
6. Marie de Médicis, by G. Dupré
7. George Monck, by Thomas Simon, 1660

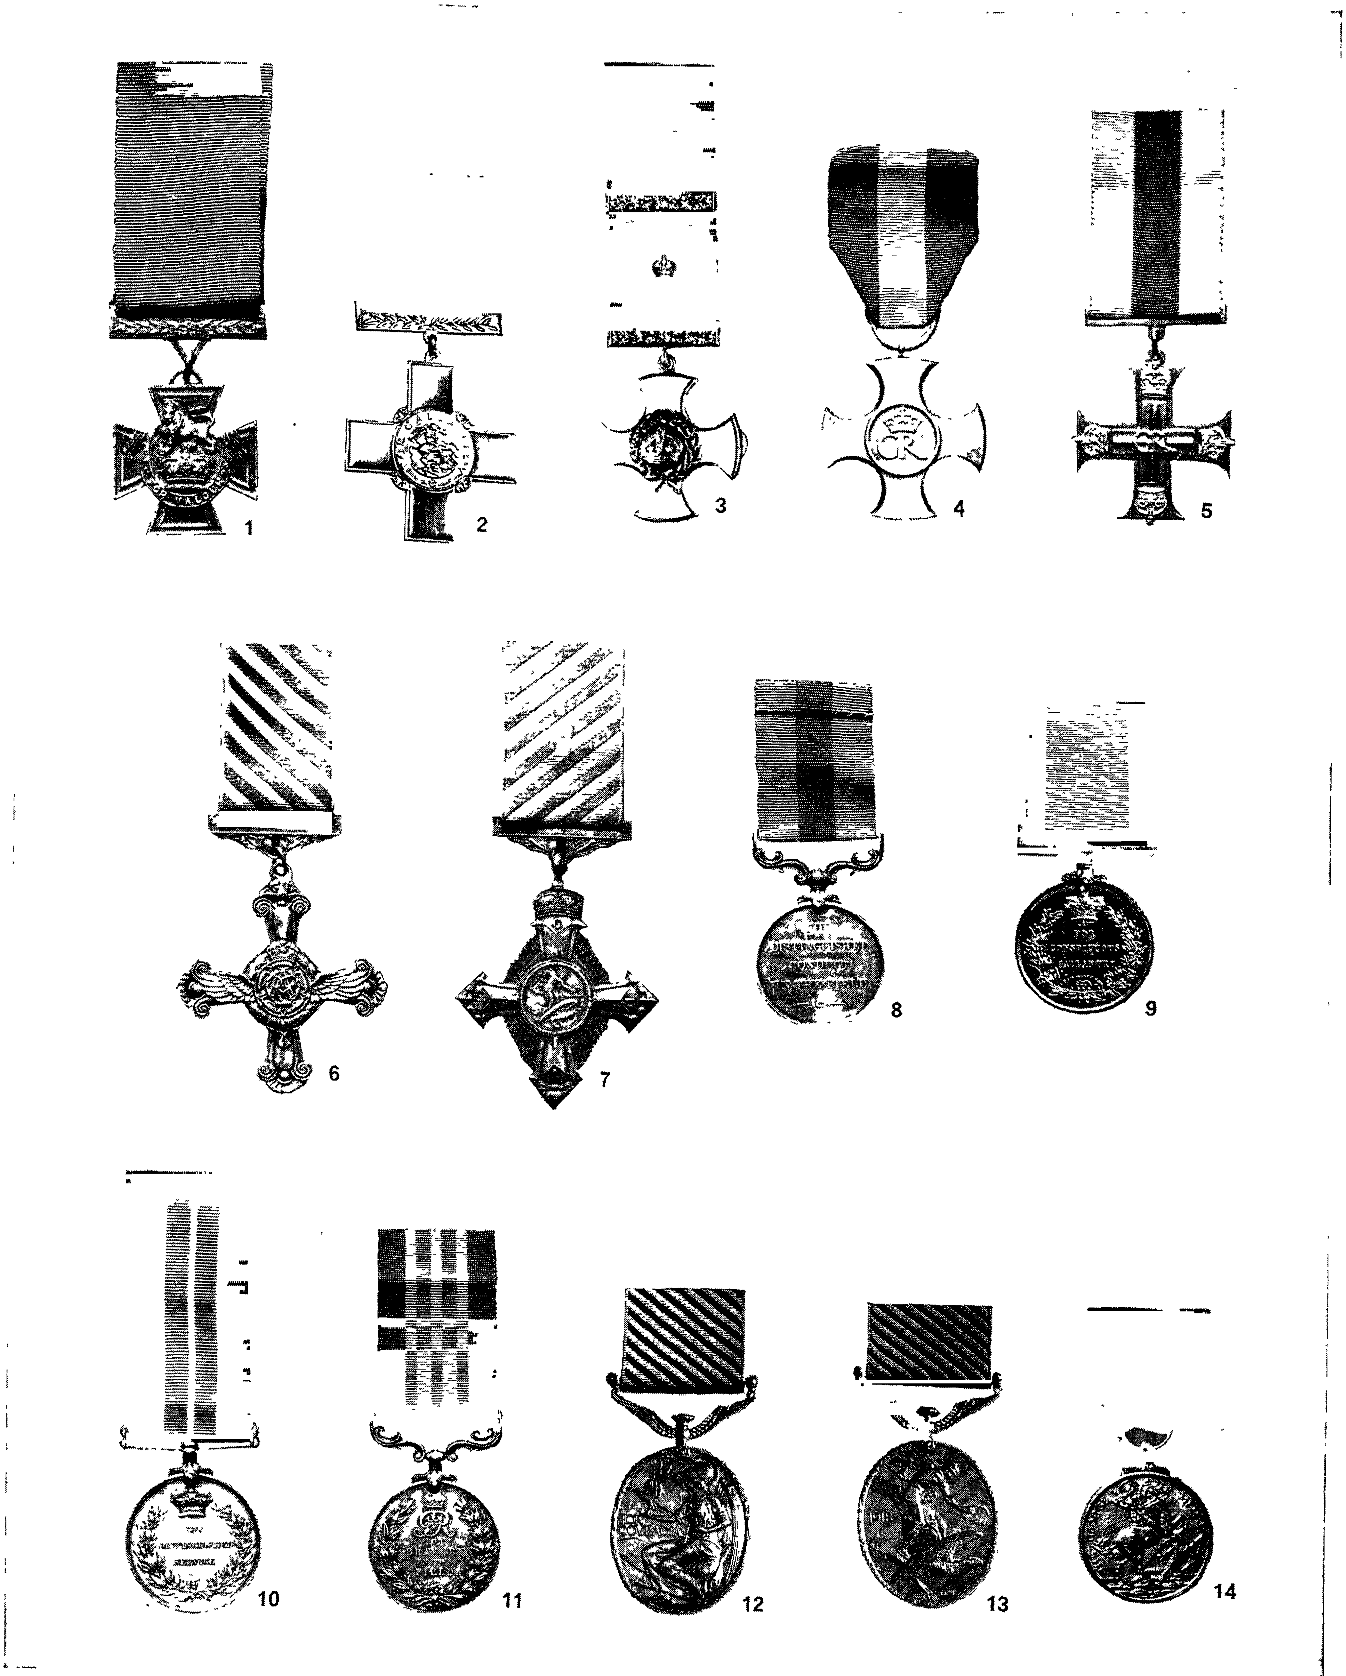
U.S. MILITARY AND NAVAL MEDALS AND DECORATIONS

ARMY MEDALS: 1. Medal of honour, 1st design. 2. Medal of honour, 2nd design. 3. Distinguished service cross. 4. Distinguished service medal. 5. Victory medal. 6. Victory medal clasps. ALL SERVICES: 7. Purple Heart. NAVY MEDALS: 8. Medal of honour, 1st design. 9. Medal of honour, 2nd design. 10. Navy cross. 11. Distinguished service medal. 12. Civil War service medal. 13. Marine Corps brevet medal. 14. Meritorious service medal



BRITISH ORDERS, CROSSES AND MEDALS

1. Victoria cross
2. George cross
3. Distinguished service order and bar
4. Distinguished service cross
5. Military cross
6. Distinguished flying cross
7. Air force cross
8. Distinguished conduct medal
9. Conspicuous gallantry medal
10. Distinguished service medal
11. Military medal
12. Distinguished flying medal
13. Air force medal
14. George medal

nearly eight centuries. When Edward VI again restored a coinage of fine silver he introduced the silver crown of five shillings, which took the name of the gold piece of the same value introduced a few years earlier. The reign of Mary is notable for the appearance of the portrait of her husband, Philip II of Spain, on the shilling.

Elizabeth continued her father's denominations and restored the purity of the silver coinage. By introducing the sixpence and threepence of silver she gave the groat its deathblow, although it and the twopence continued to be struck. She also introduced coinage by machinery (mill and screw) although it was not really established until after the Restoration. James I introduced a number of new gold coins, the most important being the "unite" or sovereign (20*s.*), so called from its legend (*Faciam eos in gentem unam*) alluding to the union of the crowns. In his reign the number of denominations in use reached its maximum. Charles I made no changes in the coinage of the last years of his father, but the Civil War and the king's financial difficulties added many new coins to the English series. These were 20*s.* and 10*s.* pieces in silver and the large gold pieces, *e.g.*, £3 pieces of Oxford and Shrewsbury, the fine Oxford silver crown by Rawlins with a view of Oxford behind the usual type of the king on horseback; the siege pieces rudely struck on pieces of silver plate at various Royalist strongholds show to what straits the king's party was reduced. Under James I and Charles I are found the first English copper coins, the "Harrington" farthings; they were not struck by the king but by contract. The coinage of the commonwealth is remarkable for the simplicity of its types and this is the only period of English coinage when the legends have been in English. A series of coins was struck with Cromwell's bust and superscription but, although not uncommon, they never seem to have been put into currency.

The modern coinage dates from the reign of Charles II. After issuing the old denomination of hammered money in the first two years of his reign, he replaced the unite or broad in 1662 by the guinea, so called from the provenance of its gold, still a 20*s.* piece. It was not until 1717 after various oscillations that its value was fixed at 21*s.* His silver coins were the crown, half crown, shilling, etc., all regularly and beautifully struck by Jan Roettier with the new mill which was then established at the mint. In 1672 he introduced the bronze halfpenny and farthing with the Britannia type. The finest coin of his reign is not a regular issue. It was the "Petition" crown made by Thomas Simon, engraver at the mint under the commonwealth, and bears on the edge a petition to the king that he might be given the same office under the new regime. The coinage of the 18th century calls for no remark; one may just mention the practice of recording the provenance of the metal of particular issues as in the VIGO issues of Anne struck from captured Spanish bullion in 1702, the Welsh Copper company shillings of George I and LIMA coinage of George II made of bullion brought by Anson from his voyage around the word. Toward the end of the century the scarcity of government silver was largely made good by Spanish dollars, with or without a bust of George III countermarked upon them, and by tokens issued by the Bank of England while the deficiency in copper was made up by the private issue of vast numbers of tokens. In 1816 the great recoinage took place with the introduction of the sovereign and silver coins each with Benedetto Pistrucci's design, St. George and the Dragon. In 1848 in the reign of Queen Victoria the 2*s.* piece (florin) was issued and proved a most popular coin. The double florin which was first issued in 1887 did not take the public fancy and the practical disappearance of the crown piece also from circulation reflects the public prejudice against large coins. The gold sovereign was last struck in 1917 but it had disappeared from currency in 1914 soon after the outbreak of World War I, after a career of 300 years as sovereign, unite, guinea and again sovereign.

Wales has never had a regular coinage but there exist two unique coins of Welsh kings, a penny of Howel Dda (*c.* 910–40) and another of Llewellyn (1075–79).

Scotland.—The coinage of Scotland followed similar lines to that of England in regard to types and weights: the earliest coins are silver pennies resembling the contemporary coins of England. The silver coins are baser and of inferior work but the more rare gold coins present several remarkably fine pieces of workmanship. The Scots coinage decreased in quantity after the union of the crowns in 1603 and ceased in 1709 after the union of the parliaments. The only extensive and varied coinage is that of Mary Queen of Scots.

Ireland.—Ireland had an extensive silver coinage in the 10th century, mainly copies of the Anglo-Saxon coinage by Danish kings, Sihtric III and his successors. The Anglo-Irish coinage began in 1177 with pennies and halfpennies of John, the only coins to bear his name which does not occur on the English coins. The quality of the coinage became more and more debased, reaching its final degradation under the Tudors. Gold was never struck by the government but copper was introduced quite early. The Civil War, as in England, produced a number of siege-pieces, notably the Inchiquin and Ormonde money. James II in his campaign in Ireland issued vast numbers of gun-metal coins ranging from the 2/6 downward. These were to be cashed for silver when he regained the throne. They are unusual as they bear the date in months. Irish coinage under the British regime did not actually come to an end until the reign of George IV, the last issue being in 1822. In 1928 coinage by the Irish Free State was introduced.

We may note that the Isle of Man had its own coinage from 1709 under the Earls of Derby to 1864 under Victoria and that the Channel Islands of Jersey and Guernsey have had their own bronze coinage for over a century.

ASIATIC COINS

Achaemenids.—The ancient kingdoms of the nearer east, Sumerian, Assyrian, Babylonian and Hittite, had no coined money, nor had the earlier Achaemenids of Persia. Not till after Cyrus conquered Lydia in 546 B.C. did the Persians learn the art of coinage. It is not certain which Achaemenid ruler first struck coins but it was likely Darius Hystaspes (521–486) as Herodotus suggests. The coins of the dynasty were the daric (*i.e.*, the coin of Darius) of gold of very pure quality and the siglos in silver. Thus early we have the relationship of sovereign and shilling anticipated, for 20 sigloi (shekels) made a daric which weighed a little more than an English sovereign. The types of both coins were the same: obverse the Persian king in a kneeling position holding a bow in his left hand and a spear in his right; the reverse bears no type but only a rough irregular incuse caused in the striking. In shape they are roughly oval being struck from round or rather egg-shaped globules of metal. These pieces were uninscribed and remained in issue unaltered in type until the fall of the empire. The issue of gold was the royal prerogative, but the conquered Greek and other cities and states were allowed to issue silver and copper while a number of Persian satraps struck silver in their own names; to this latter class we owe a number of the earliest and finest portraits on coins. On the fall of the empire, various satraps, such as Mazaeus who ruled Babylon for his new master Alexander the Great, struck silver coins of their own.

Parthians.—In the middle of the 3rd century the Parthians rebelled and cast off the Greek (Seleucid) yoke and soon became a great power in Persia. They had an extensive but monotonous coinage in silver (tetradrachms and drachms) and copper. The tetradrachms and drachms bear the bust of the king and Arsakes, the founder of the dynasty, seated holding the Parthian bow on the reverse of the drachms. The usual reverse on the tetradrachms is the king seated receiving a wreath from a Victory or a city goddess. The coins do not bear the name of the issuer but that of Arsakes, the founder of the dynasty, and the inscriptions range in length from the simple (coin of) "king Arsakes" to legends such as (coin of) "the great king of kings, Arsakes, the just, the illustrious, the divine, the friend of the Greeks." After Phraates IV the coins are dated in the Seleucid era; on the later coins the Greek becomes corrupt and broken and is joined by an inscription in Pehlevi, a language then more intelligible to those who used the coins.

The kings of Persis, who became independent about the same

time as Parthia, began their series with very fine portrait tetradrachms but the coins rapidly degenerated; their reverse type, a fire altar with or without attendant priests, was revived by the Sassanians so that it had a life of nearly 1,000 years; numerous debased silver, almost copper, tetradrachms of the rulers of Characene and of the Omani on the lower Tigris down to the sea still exist to record the names of forgotten rulers.

Sassanians.—In the beginning of the 3rd century A.D. Ardashir, a native Persian prince, overthrew the last remnants of Parthian power and founded the great Sassanian empire which ruled all western Asia. The Sassanian coinage was very extensive in silver and the early emperors regularly coined gold although the latter was rare. The copper coinage also seems to have been small. The coin types throughout the dynasty are the same for all metals; on the obverse is a bust of the king with a long legend of the form (Ardashir, etc.) "worshipper of Ahura Mazda, divine king of kings of Iran," and on the reverse a fire altar usually with two attendant priests and the legend "the fire of (Ardashir or other emperor)"; from the time of Kobad the reverse legend gives the mint and the regnal year of issue. The standard of the gold coins is derived from that of the Roman solidi; the silver coins are drachms following the Parthian standard and are remarkable for their broad thin fabric which was copied by the Arabs for their silver coins. The execution of the portraits especially in the 3rd and 4th centuries is remarkably fine.

Caliphates.—The early Arabs were unacquainted with the art of coinage which had died out in Arabia with the extinction of the Himyarite kingdom in the south; it was not till the conquering armies of Islam had wrested Syria from the Byzantines in the east and overthrown the Sassanian empire of Persia in the west that they became acquainted with regular currencies and with the sudden accession of wealth found the need of one. At first they issued gold and bronze pieces imitated from contemporary Byzantine coins, modifying the cross on the reverse of the latter somewhat to suit Moslem susceptibilities; the earliest silver coins were copies of late Sassanian coins with the addition of *bismillah* (in the name of God) on the margin. The need for a purely Arab coinage worthy of the now vast Arab empire was soon felt and toward the end of the 7th century the fifth Omayyad caliph, 'Abd al-Malik (A.D. 685–705), instituted a coinage more in keeping with the principles of Islam. This coinage was of gold, silver and copper and the names *dinar* (denarius aureus), *dirhem* (drachm) and *falus* (follis) were borrowed from the Byzantines, as were also the weights of the gold and bronze. It is interesting that the gold and bronze kept the thick fabric of the Byzantine originals while the silver retained the thin fabric of the Sassanian drachms; it was some centuries before this distinction of fabric disappeared. The strict interpretation of some sayings of Mohammed on image-making had removed a vast field of activity from the Moslem mint engraver by limiting him to legends instead of types. This, however, gave Arab coins a historical value which the coinage of no other race possesses. From the earliest times they bear the mint and date and in time the ruler's name and title often with valuable genealogical data and titles of historical interest. Every Moslem claimant to sovereign power took the earliest opportunity of striking coins and we possess coins of rulers and pretenders known to have had the briefest reigns and in some cases their coins still testify to the existence of rulers unrecorded by history.

The dirhem of 'Abd al-Malik bears on the obverse the Moslem profession of faith: "There is no god but God: he has no associate" and around is the marginal legend: "In the name of God this dinar was struck at —— in the year ——." The reverse area has a quotation from Koran cxii, "God is alone; God is eternal: He begets not and is not begotten nor is there any one like unto Him." Around is Koran ix, 33: "Mohammed is the Prophet of God sent with guidance and the religion of truth to make it prevail over all other religions averse though the idolators may be." This type of coin, issued from Spain and Morocco to the borders of China, gave Moslem coinage the character which it held for centuries. In mid-8th century the 'Abbāsids overthrew the Omayyad caliphate but at first made little change in the coinage. The long reverse formula was replaced by the simple statement "Mohammed is the Prophet of God" and in time the caliph's name was added and at the provincial mints that of the local governor and in the 9th century a second marginal inscription was added: "To God belongs the order before and after and in that day believers shall rejoice in the help of God" (Koran xxxi, 3–4). Among the more remarkable coins of this series are those of Hārūn al-Rashid (786–809) which bear the name of his vizier and boon companion the ill-fated Barmecide Ja 'afar, whose fame, like that of his master, has been spread by the *Arabian Nights*. The extensive gold coinage of the 'Abbāsids became one of the great currencies of the mediaeval world and Offa in his efforts to found an English coinage imitated a dinar of al-Manṣūr (A.D. 754–775).

The 'Abbāsid caliphate broke up in the 9th and 10th centuries and the succeeding independent governors regularly put their own names on the coins although they retained that of the caliph of Baghdad whose spiritual authority was still recognized. Among such dynasties were the Omayyads of Spain, who issued an extensive coinage mainly in silver from the middle of the 8th till the end of the 11th century, the Idrīsids, Tūlūnids, 'Aghlabids and Ibhshīdids, all short-lived dynasties in North Africa and Egypt, coining mainly in gold. In central Asia there was the extensive coinage of the Sāmānids of the days when Samarkand and Bukhara were great centres of culture and poured their wealth into northern Europe to buy costly furs, as the great finds of Arab coins around the Baltic show. The 'Abbāsid coinage continued down to the 13th century but Baghdad was almost its only mint in its latter days; its last coins were very handsome large gold pieces. Minor dynasties mainly of Persian origin were the Ṭā'hirids, Saffarids and Būyids whose silver coins are still valuable historical documents.

In the 10th century the Fāṭimid caliphate, of Shī'a origin, arose in western Africa and in time conquered Egypt. Its extensive currency of gold introduced a new type of dinar with legends of the usual type but arranged in three concentric circles; they held Sicily for a time and the coins struck were imitated by their Norman successors. A little later the Turks arose in the west, swept before them the smaller dynasties and ultimately ruled all western Asia. As the Ghaznevids, they ruled in Afghanistan and part of India; Mahmud of Ghazni struck coins with inscriptions in Arabic and Sanskrit, the latter for his Indian dominions. His regular gold coinage and those of the great Seljuk Tughril Bey are among the last issues of the old type and in the 13th century we have a series of remarkable innovations. The descendants of the original Seljuk conquerors divided their conquests in western Asia into numerous small states. Their scarce gold coinage follows orthodox lines, while giving a wealth of historical information, but the most remarkable of their issues was an extensive series of large copper coins bearing a remarkable number of different types borrowed from all sources, ancient Greek and Roman and Byzantine. They seem to have taken a childish delight in reproducing any coin type or even picture that took their fancy. Such are the coins of Karā Arslān (1168–1174) with reverse the familiar Byzantine type of Christ seated or of Alpī (1152–1176) with the virgin crowning a Byzantine emperor. Their silver coins were directly influenced by the aspers of the Byzantine emperors and more particularly by those of the empire of Trebizond. From the latter comes the type of a horseman with a mace over his shoulder, popular with the Seljuks of Asia Minor. Notable among the silver coins of this period are those of Kai Khusru II (1236–45) with the Lion and Sun type, the horoscope of his beautiful Georgian wife whose portrait he even wished to put on his coins. It is these Turks, Seljuk, Ortukid and Ayyubid, who were the "Saracen" opponents of the Crusaders, the best known of them being Saladin, the Ayyubid sultan of Egypt and Syria; his silver coins and those of his family give their titles at great length to the exclusion of religious legends. During this period and a little later some of the most beautiful coins the Moslem world has produced were being struck by the Almohads and Almoravids in western Africa. These large thin pieces of fine gold bear long genealogical

and religious legends written in a beautiful, often elaborate script. Ibn Baṭṭūṭa, the Moorish traveller, remarked that nowhere were the dinars so large and beautiful as in his native land.

In the 13th century the Mongols swept through all Asia except India until checked on the Egyptian frontiers. Of the Mongol lines, the Khans of the Golden Horde in the north issued an extensive series of small silver coins; the greater and wealthier line of the Ilkhans of Persia struck large and handsome coins in all three metals, with the Khan's titles in Mongol on the reverse and the Mohammedan creed in the Shī'a form on the obverse. In Egypt the Bahrī and later the Burjī Mamluks struck a series of large gold coins down to the 16th century; their silver coins are more rare. In the 14th century the great Tamerlane (A.D. 1369–1404), a distant descendant of Jenghiz Khan, revived the power of the Mongols; the majority of his coins (silver and copper) bear the name of his nominal sovereigns Suyurghatmish and Mahmud on the reverse and the Kelima on the obverse. His son and ultimate successor, Shāh Rukh, introduced a new type of dirhem, obverse Kelima with the names of the first four caliphs on the margin and his titles on the reverse, which remained popular throughout the 15th, 16th and early 18th centuries; gold was not struck in Asia during this period. In the meanwhile the eastern half of the Moslem world was passing to the Ottoman Turks. Their coinage of gold and silver, which became gradually more and more base, and bronze is monotonous in its legends of stereotyped titles and mints only. Their wealth of mints gives their coins a certain historical interest as they trace the expansion and decline of Ottoman power in Europe, Asia and North-Africa. A notable feature of the Turkish coinage is the tughra, an elaborate monogram formed of the sultan's name and titles which occupies one side of the coin from the 16th century onward. Latterly Constantinople and Egypt were the only Turkish mints of importance. The coinage of Morocco rapidly degenerated in every way from the 16th century onward, though its most recent issues struck in Paris, Berlin and Birmingham show an improvement.

Persia.—The earlier coins of the shahs of Persia are descended through the Shaibanids from those of Shāh Rukh; at first they are large thin silver pieces of Central Asian style but in the 18th century the fabric changes and the coins become smaller and thicker as in India. The coins, especially the larger pieces, are remarkable for their fine calligraphy; the legends are usually in the form of rhyming couplets; gold is not common till the 18th century. Copper was not a regal but a local issue and each city issued its own. The coins are remarkable from the the fact that each city's has some type, usually an animal. Some of the products of the Persian mint are of huge size (for example, a gold piece of 80 tumans weighing over a pound) and were pieces struck for presentation to distinguished officials. In the latter part of the 19th century Nasr-ed-Din (1829–1896) abolished the provincial mints and instituted a coinage from a central mint in Tehran with European machinery. Henceforth the coins of Persia bear the portrait of the shah on the obverse and the "lion and sun" on the reverse.

Afghanistan.—The emirs of Afghanistan who became independent of Persia in the 18th century and carved out a kingdom at the expense of their neighbours in Persia, central Asia and India, struck coins in gold and silver on the standards of the Mogul emperors whose poetical legends they also copied. At the end of the 19th century a mint on European lines was established in Kabul and the high-flown distichs were replaced by a representation of a durbar hall. The Afghan coinage of the 19th century was mainly silver, although earlier gold also was common.

Of the various smaller modern dynasties which ruled central Asia till the Russian conquest, the emirs of Bukhara and of Khokand are notable for their extensive issues of gold pieces, to the practical exclusion of other metals.

India.—There is no reason to doubt the independent origin of coinage in India although it was soon so much modified by Greek influence that the question was long disputed. The earliest coins are pieces of silver, very commonly square, and of copper punched with various symbols on both sides. Of about the same date are the square and round cast copper pieces with similar but less varied symbols. These pieces circulated all over India and belong to at least the 4th century B.C. although they circulated after this date and may be somewhat earlier. Contemporaneously from the 3rd century onward are the copper coinages of numerous states and dynasties which show increasing Greek influence and whose few silver coins are directly influenced by the hemidrachms of the Greek rulers of northwest India of the 2nd century B.C. The types of these are of considerable mythological and religious interest. Technically they are interesting as showing the evolution of a type from a series of separate punches to the grouping of the punches on a die.

Early in the 2nd century B.C. the Greeks of Bactria began to invade India and their coinage is remarkable for its fine series of portraits and for the number of names it records of rulers otherwise unknown. Prakrit legends begin to appear alongside of corrupt Greek; the Greek in time becomes more and more corrupt as the Greek rulers were replaced by Scythian and Kushan invaders who copied their types. The Greek deities gradually give place to Indian ones on the coins.

In the middle of the 1st century A.D. the Kushans founded a great empire in northwest India; they have left a wealth of gold and copper coins with legends in an Iranian language in a corrupt Greek character. During this period Roman gold in enormous sums went to India every year and was recoined there. The Kushan coins bear on the obverse the king sacrificing and on the reverse deities of all the religions of the time, Greek, Roman, Zoroastrian, Hindu and Buddhist. This type of king on obverse and deity on reverse became the general type of north Indian coinage for the next 1,000 years; the Kushan coinage continued, rapidly degenerating till the 4th or 5th century, over a much more limited area; the type was continued by the kings of Kashmir down to the 10th century and adopted and modified by the great Gupta emperors in the 4th century. The latter struck an extensive gold coinage with long legends in poetical Sanskrit and many interesting types, often medallic in nature, but, on their coins for general currency at least, always betraying the Kushan prototype. Among the more notable Gupta coins are those that commemorate Sandragupta's horse-sacrifice, or those that record his skill as a lyrist, to which he also testifies in his inscriptions. The art and correct Sanskrit legends of these coins are in keeping with the great Hindu revival of the period.

In western India a dynasty of western Satraps of Persian origin had been ruling since the 1st century B.C. Their extensive coinage of silver only is dated and therefore of a historical value unusual in Indian or any early coinage. They look modern in that they bear on the obverse a bust of the ruler; they resemble Roman denarii and may have been influenced by them but their prototype is rather to be sought in the hemidrachms of the later Greek kings of India. This kingdom was overthrown by the Guptas at the end of the 4th century and they at once began to imitate this silver coinage not only locally but also in their own territory which seems previously to have had no silver coins. The barbarian Huns who destroyed the Gupta and other civilizations in the 6th century have left numerous coins, imitated from Sassanian, Gupta or Kushan prototypes. Degenerate copies of these seem to have been the coinages of northern India until the revival of various Hindu dynasties from the 10th century onward. A notable innovation was the neat silver coinage of the Shahis of Gandhara of the "bull and horseman" type in the 9th and 10th centuries, extensively imitated by the Mohammedan conquerors of India and the contemporary minor Hindu dynasties. The other type favoured by the mediaeval Hindu dynasties for their gold coinage was that of a seated goddess—going back to a Gupta reverse—and an inscription with the king's name on the other side.

The coinages of southern India form a class by themselves. In the later centuries B.C. and early A.D. the Andras ruled a great kingdom in central south India; their coinage is mainly of lead and has types of the usual indigenous character.

The later mediaeval dynasties of south India struck coinages mainly of gold, the type of which is usually the badge of the dynasty; the Cheras of Malabar for example had an elephant and

the Chalukyas of the Deccan a boar, the Pandyas a fish and the cup-shaped pieces of the Kadambas bear a lotus. The Chola dynasty introduced under northern influence the type of a king standing on obverse and on the reverse the king seated, which spread through south India and was taken to Ceylon by the Chola conquest and adopted by the local rajahs there. The great Hindu kingdom of Vijayanagar (Mysore) left a large series of small gold and copper coins with the types of various deities which had considerable influence on the modern coinages of southern India including those of the various foreign companies.

The earliest Arab invaders had reached India in the 8th century and founded a dynasty in Sind which has left numerous very small silver coins of the Omayyad type. Not till the 11th century was India seriously affected by Moslem invasions when Mahmud of Ghazna conquered the Punjab. His empire was short-lived. In 1193 the Ghorid Mohammed bin Sam defeated the allied Hindu forces and became lord of India. His descendants ruled northern India from Delhi till the Mogul conquest. Their coinage is varied and extensive, mainly gold and silver tankas (or rupees) of 178 grains. They are large thick pieces with the profession of faith on one side and the name of the king, mint and date on the other. A feature of this coinage is the unsuccessful attempt made by Mohammed III b. Tughlak (A.D. 1324–1357) to replace gold and silver coinage by brass tokens. Gold was hardly issued at all in the 15th and 16th centuries and for a time the coinage was mainly billon. Sher Shah (1539–45), one of the ablest of the line, issued a large silver currency of a type, carrying the Kelima and names of the four caliphs, which was imitated by the Mogul successor of the Suris.

During the latter half of the period of the sultans of Delhi, various dynasties made themselves independent; such were the rulers of Bengal, Gujarat, Jaunpur, Malwa, etc., whose coins all follow the standards of the central power. Those of Bengal are mainly silver rupees with rare gold; the currency of Jaunpur, gold and billon. Malwa and Kashmir gold and silver coins were square.

The coinage of Bāber and Humāyūn, the first two of the Mogul conquerors of India, are not extensive and are of central Asian types. With the next two, the Great Moguls Akbar and Jahāngīr, is found a series unrivalled for variety and, within their limitations, beauty—the gold coins of Jahāngīr are noble examples of Moslem calligraphy, an art evidently cultivated as much as painting at his court. The mints of the Mogul coins reflect dynastic fortune—even Shāh Jahān's brief occupation of Balkh is at once recorded on a gold mohur. The close association in the Moslem mind between sovereignty and the right of the coinage is exemplified in the existence of the coins of many pretenders to the imperial throne, some of whom we know from history to have had the briefest spell of power. The general type throughout is the same. In the 16th century the type that goes back to Sher Shah prevails, the Kelima with the names of the first four caliphs and the emperor's titles on the other side; Aurangzib replaced the confession of faith by the mint and date and this remained the usual type till the end of the dynasty. The emperor's name is usually enshrined in a Persian couplet to the effect that the metal of the coins acquires added lustre from bearing the emperor's name. Nearly 50 such verses are found on Jahāngīr's coins. The latter's reign is also remarkable for the series of coins bearing the sign of the zodiac and the set of portrait mohurs, one of which represents him holding a wine cup. He also allowed his wife, Nūr Jahān, to strike coins in her own name, and she is also said to have inspired the issue of the zodiacal series. From the beginning of the 18th century the coins become stereotyped and the epigraphy loses its beauty. Numerous native states began to arise and throw off the Mogul yoke, but to the middle of the 19th century they continued to coin on Mogul lines. The English and French East India companies for years copied the native types from the coinages and did not strike on European lines till the 19th century. The right of native states to mint their own coinage was gradually curtailed by the British government until there were very few independent coinages. The most important native state mint at present is Hyderabad, which several years ago instituted a mint with European machinery. Before leaving India mention should be made of the extensive coinage in gold and silver with Sanskrit legends of Nepal, which is still being issued, the long series of octagonal gold and silver coins of Assam struck down to the British conquest, and the brief coinage of Burma in the 19th century.

Chinese.—In spite of the very early references to money in Chinese literature, there is no reason to believe that the earliest coins are much older than the 7th century B.C.; that is to say that coinage originated independently in the far east about the same time as it did in the west. The earliest Chinese coins are small bronze spades and knives, copies of the spades and bill-hooks and other small articles of husbandry that had been used for barter. The knives are about six inches long and bear the value and name of authority issuing it; *pu* money, a modified form of the spades, circulated widely in the 5th and 4th centuries B.C. Small change was supplied by cowrie shells in this period, as it had been long before the invention of a coinage. There was an issue of bronze cowries in the 7th century B.C. Round money with a hole in the centre was issued as early as the 4th century but it was not till 221 B.C. that the reforming Shah Huang Ti (221–210 B.C.) superseded all other currencies by the issue of round coins of half an ounce (*pan-liang*), which were continued by the Han dynasty. This coin became gradually reduced and debased and was replaced in 118 B.C. by the emperor Wu Ti's five-chu piece which remained the coin of China for the next eight centuries; a break in the monotony of the regular coinage is formed by the archaistic innovations of the usurper Wang Mang (A.D. 9–22) who issued a modified form of the *pu* and knife currency and a new round coin (*ho tsien*). The history of Chinese coins is the history of a series of gradual debasement of the government currency until it is overwhelmed by the increasing activity of forgers and a new coin is instituted. On one occasion at least the most skilful of the forgers were given work at the government mints. The five-chu piece lasted till the rise of the T'ang dynasty when the emperor Kau Tsu in 618 issued the *Kai-yuan* coin which gave the coinage of all the far east its form till the end of the 19th century—a round coin with a square hole and a four character legend of the form "current money of (regnal period)." The southern Sung dynasty (A.D. 1137–1278) dated their coins on the reverse in regnal years and the Ming dynasty (A.D. 1368–1628) put the mint name on the reverse as did the Ching dynasty (A.D. 1628–1911), the latter giving it in Manchu characters. Paper money has been in use in China since the 9th century and was current almost to the exclusion of regular coins under certain of the Mongol emperors, for example Kublai Khan, whose paper money is described by Marco Polo. For over 2,000 years the copper cash with occasional multiples of it was the only coinage of China; gold and silver were current by weight only, the latter in the form of boat-shaped ingots. The monotony of the series is only rarely broken as for example by the nail-mark of the emperor Wen-Teh on the Kai-yuan pieces, an issue of lead coins in the 12th century and the issue of large token pieces going up to 1,000 cash in value during the Tai Ping rebellion when the rebels held the copper mines. With the increasing popularity of Spanish colonial and Mexican dollars as a silver currency in China, several attempts were made to institute a silver coinage in the 19th century; not till the very end of the 19th century were mints established to strike silver and copper coins of European style in all the provinces. One of the last of these, a rupee of Szechwan, was the only coin of the Chinese empire to bear the head of an emperor. This was because it was intended to compete for Tibetan trade with the Indian rupee. Under the republic, coins were at once struck with the portraits of Sun Yat Sen and Yuan Shih Kai, and the various generals who have since been fighting for China have issued their own coins with their portraits. A feature of the issues of the latter has been the number of gold coins they have issued, for the first time in Chinese history. The very extensive series of talismans, coinlike in shape but usually larger should be noted. Many are Taoist and Buddhist in their legends and types; others are simply lucky pieces.

Japan.—The art of coinage was borrowed from China by Japan whose first bronze coins were issued in A.D. 708. Twelve

different issues were made down to the middle of the 10th century, each of a different reign. For the next 600 years, however, no government coins were issued and the currency was supplied by imitations of contemporary Chinese coins made by the great nobles. In the 17th century the copper *kwan-ei* was first issued in 1624 and remained in vast variety the usual issue for over two centuries. The *ei-raku* and *bun-kyu* sen of the 19th century were the only other regular copper coins. Unlike China, Japan has had a gold and silver currency since the 16th century. The gold coins are large flat pieces in the shape of rectangles with circular corners, the largest size being *obans* and the smaller *kobans;* these bear various small official stamps and a large signature in ink of a mint official. They range in length from 6 in. to ½ in. Other gold pieces are the small rectangular pieces of 1 and 2 *bu* issued from time to time; round gold is rare and usually of provincial mints. There have not been many issues of silver, usually in small rectangular pieces; the so-called bean money with the figure of Daikoku is not a currency but was made to add to the large, long silver presentation pieces to bring them up to a certain weight. A notable Japanese coin is the oblong silver piece struck in 1765 out of confiscated silver ornaments by an official named Taruna.

In 1869 a mint on European lines was established in Tokyo and gold, silver (yen or dollar) and copper have since been regularly issued from it. The *e* sen of Japan are not coins but amulets and bear figures of Daikoku, the god of wealth, Itsibu fishing, etc.

Korea.—Korea has had a bronze coinage of the Chinese style since the 12th century, but it is only with the institution of *Shang Ping* cash at numerous mints, with an elaborate system of dating or rather numbering the issues between 1790 and 1881, that its coinage becomes common. Attempts were made to establish a silver currency during the last years of its independence. Annam began by imitating Chinese coins and had a regular bronze coinage of its own on the Chinese model from the 10th to the 19th century. Silver became common in the 19th century in the form of narrow oblong bars. Annam also has its amulets or rather presentation pieces. These are in gold, silver, and copper with a variety of designs bearing auspicious inscriptions, quotations from the Chinese classics, etc., in addition to the king's name. The native coinage ceased when Annam became a French possession.

Siam.—Siam down to the middle of the 19th century struck gold and silver in the form of balls formed by doubling in the ends of a short thick bar of silver, and bearing the stamp of the reigning monarch. Since 1850 it has had a coinage on European lines with portraits and issues in gold, silver and copper and more recently in nickel.

The native kingdoms of the Malay Straits used lead for their coinage, these are usually round with Malay or rarely with Chinese inscriptions; an exception is found in the "hat money" of Pahang in the form of a hollow square with truncated pyramids and a Malay inscription along the bottom. The spear money of the Nagas, the canoe-shaped and willow leaf money of the Shan States and the "snail shells" in silver of the more primitive parts of Burma can only be mentioned here.

TECHNIQUE AND ART

The technique of production of coins and medals has remained in principle the same from the earliest period of coinage to the present day; the gradual introduction of more complicated machinery, while lessening the part played by human hand and eye in the later stages of the process, has never, unless the so-called photosculpture be acknowledged as an art, eliminated the part of the artist in producing in one form or other the actual relief of the coin or medal type.

Casting and Striking are the two sharply distinguished methods of production. The former, although it was little employed in antiquity save for large coins, may be described first, since it was the method that metal-workers used on a larger scale for the solid casting of statues, statuettes and decorative work, etc. A model was first built up in wax or clay. The process of carving the model out of a mass of wax was occasionally employed, sometimes partly combined with the building up process, but there is no evidence of this before the days of the Renaissance. Another method of producing the model, that of carving it in boxwood or pearwood or in fine stone, such as Solnhofen stone or slate, was brought to a high degree of perfection by the Germans of the Renaissance; it was almost unknown in Italy. The model once made was impressed in a mould of fine sand or other material, and a cast was made. Some of the German medallists of the Renaissance seem to have carved the design in reverse in clay (just as if they were carving a matrix in hard material) which was then baked and used as mould. In the case of small coins a number of moulds were often combined, with channels leading from one to the other. Tree-like sets of coins produced in the Far East by such casting *en chapelet* are still extant.

The coins produced by this process are seldom of precious metals and almost entirely negligible as works of art, being of the roughest kind. But the method was employed by all the greatest medallists, from the founder Pisanello, in the 15th century, onwards, in preference to the more mechanical process of striking. Casting was carried to a high degree of excellence (especially by the Germans), the ideal being to reproduce the wax model without subsequent chasing. The Italian medallists were sometimes content with the roughest representation of their work. Others depended on chasing with the burin or graver to remove the irregularities of the cast; and often the chasing was by an alien hand. Any coin or medal could be used as a model, for impressing

in moulding material, so that a new cast could be made. The vast majority of the extant medals supposed to be of the 15th or 16th century are after-casts to the nth degree. Detail has disappeared and the actual diameter has decreased since metal contracts in cooling.

The Repousse Process (*q.v.*) can of course also be used in making medals, in shells, of which the two halves are worked separately. This process was especially favoured in Holland in the 17th century. The process of pressure-casting has also, it is said, been used in recent times. Plaquettes (which are small metallic reliefs, differing from medals in being primarily decorative, not commemorative, usually one-sided and more frequently rectangular than circular) are produced like medals.

Striking of coins or medals is done by means of dies, engraved in intaglio, and impressed on the metal by blows or pressure. It is the method of impressing a signet on wax applied to a hard material, the type of a coin being, indeed, in origin and principle the signet of the issuing authority. The die had first to be engraved in a hard material. Not until Roman times was iron and occasionally steel used for this purpose. The Greeks used bronze, and analysis of two of the extremely few Greek dies that have survived shows a proportion of from 18 to 22% of tin, the rest being copper with negligible impurities. Such proportions mean a very hard quality of bronze. Modern dies are all of steel.

Hubbing and Cutting.—The die can be cut direct in reverse as an intaglio gem is cut. Or a positive punch or hub can be carved in relief in hard metal, and hammered into a piece of softer metal, which can then be hardened for use as a die. Details which cannot be produced by hubbing in this way can be finished by direct cutting. Both methods were known to the ancients; though no ancient hubs, and very few ancient dies are preserved, examination of the struck coins reveals certain details which can only be due to hubbing. The amount of time and labour saved by hubbing is immense; with one hub many dies can be made, whereas if the design is represented by a die alone, when that breaks or wears out all the work has to be done again. The instruments used in antiquity by die-engravers were the graver or scauper and the dotting-punch. There is no evidence that they used the drill, although that instrument was in the hands of every gem-engraver. The fineness of the work, the almost microscopic detail, must have necessitated the use of magnifying glasses, and there is evidence, literary and material, that these were known to the ancients. (*See* ENGRAVING.)

The Reducing Machine.—The second way of obtaining a die was invented in the 19th century and, greatly to the detriment of the art, ousted the method of cutting by hand. It involves the use of the reducing machine, which dates in origin from about 1839 (*see* MINT). The artist first makes a model in wax or plaster at least four times the size of the piece to be produced. This, reproduced in a nickel-faced copper electrotype, is placed in the machine, which works on the familiar principle of the pantograph. A tracer at one end of the proportional arm moves over the whole surface of the model. At the other end a cutting point, revolving rapidly, cuts an exact, mathematically reduced reproduction of the model. Thus is produced a punch which, when driven into another piece of soft steel, afterwards hardened, gives the die which can be used to strike the coin or medal. It is obvious that the die so produced is at least three stages removed from the artist's original model which may not be suitable for a small scale relief, however exact.

The result of the introduction of this machine has been that artists have ceased to trouble themselves about the final metallic product. Not having to cut the metal themselves, they have lost the sense of material. They model in wax or plaster, and the coins or medals which are struck from the dies produced without their intervention appear as if they were made of wax or plaster coloured to look like metal.

Preparing the Blanks.—In ancient times dies were cast, sometimes actually in globular form, more usually in a form approximating to that of the final product, with sufficient convexity to allow the metal to penetrate to the deepest recesses of the die. They could also be cut from bars. The thin blanks of the middle ages were clipped out of a sheet of metal; in modern times they are punched out of a rolled bar. In antiquity, the lower die, which produced the obverse, was let into an anvil. The upper (for the reverse) was on the end of a cylindrical bar. The blank being placed on the anvil die, the reverse die was placed above it, and a sledge-hammer brought down on the upper end of the bar. How far the blank was heated before being struck we do not know. Such a primitive method of striking, without a collar to keep the blank in shape, produced great irregularities, splitting of the edge, double-striking and the like. The Greeks were indifferent to such things. The methodical Roman was more careful, and his coins are less irregular in shape. The sledge-hammer blows of course placed great strain on the dies. The first invention to obviate that disadvantage consisted in placing the dies in a frame and hammering wedges in between frame and dies, thus forcing the latter on to the blank between them. In the reign of Julius II. (1503–17) Bramante began experimenting with a press for papal leaden seals; and Leonardo da Vinci also made experiments with a coining press, and more particularly in the process of drawing strips of metal to the right thickness and punching out blanks. Out of such experiments grew the screw-press, the essential advantage of which was that the upper die was brought down on the blank not with a blow, but with a gradual pressure.

Relief and Lettering.—Those qualities which make a coin most serviceable as currency are not necessarily favourable to its beauty as a work in relief. The Greeks, for instance, being pre-eminently sculptors, made their coins in high relief. They thus suffered in circulation. It was only in the 4th century of our era that the relief of coins began to become flat, making way for the flat pattern-like treatment which is characteristic of the middle ages. That was not due to a recognition of the suitability of such treatment so much as to the decay of technique. In the use of lettering the Byzantines made an effort at decoration, but the finest development of lettering as an art on coins was left to the Moslems. In the 16th century printing wrought disaster on medal lettering.

The 13th Century.—Frederick II attempted to revive the older Roman style; his gold augustale has a head in medium relief, inspired by the Roman gold of the Constantinian period. But this was a false start. The beautiful Gothic coinages of the 14th century in France, England, the Low Countries, Italy, etc., show the high-water mark of the flat pattern style, which is by far the most suitable for a coinage which has to be packed in rouleaux and circulates widely. The facing head ousted the profile under the Lower empire. In obedience to a Roman principle, the frontal pose was alone proper to the imperial majesty.

Toward the end of the 15th century the influence of the medal, for which the profile was alone suitable, made itself felt on the coinage and the facing head thus practically disappeared. The early testoons of the Sforzas at Milan are the supreme example of profile treatment in very low relief, the finest combination of portraiture with decorative treatment that coinage can show. So far as mere engraving was concerned the highest excellence was probably reached in the 17th century by artists like Nicholas Briot and Thomas Simon; and, so far as mere finish is concerned, Benedetto Pistrucci, William Wyon or Bertrand Andrieu leave nothing to be desired.

The problem of composing within a circular field was solved by the ancients. The posing of a head, the combining of two or more heads in a group, whether they are jugate or addorsed or opposed, were the main problems of the obverse. The jugate or accollate position was not attempted until the 3rd century B.C. and did not become common until Roman times. The confronted pose offers no difficulty, and pleased the Roman taste for symmetry; but the Greeks disliked it and it is not found on their coins before Roman times.

The Greeks liked symmetry, but it had to be dynamic and full of movement; while they knew all that need be known about what is called heraldic opposition, and occasionally used it, it never played much part in their designs.

The remarkable outburst of artistic effort in England in the middle of the 8th century, when a real profile portrait head of

Offa appears on his coins at a time when the designs of all other parts of Europe were entirely without merit, had no duration or repercussion. Not even the excellent ornamental designs on the Anglo-Saxon coinage of this time, due perhaps to Irish influence, inspired continental contemporaries to efforts for better coins. Equally without effect was such an innovation as the type of the sovereign seated in majesty on Edward the Confessor's penny, as on the great seal. France had to wait two centuries until Philip II (1270–85) ventured to introduce the majesty-type. The Norman Conquest caused a definite setback in English art.

Germany.—In the next period we must turn to German lands to find the first signs of relief from the degradation of the engraver's art. About 1125 the curious pieces known as bracteates, extremely thin and bearing on one side only a type which shows through on the reverse, began to be produced in Thuringia and Lower Saxony. The designs—the figure of the king seated facing, the half-figures of king and queen side by side, the emperor on horseback, the figures of saints, often in an architectural setting, and the like—are a not unworthy reflection of the greater art of the Romanesque period. The style reaches its zenith in the second half of the 12th century under Frederick Barbarossa and Henry VI, when the coins sometimes attain a diameter of 50 mm. It was, however, in the middle of the 13th century that the real revival began.

A similar effort was made by the little republic of Ragusa in the same century. But other states, though they wisely did not attempt to attain high relief, did begin to play with the idea of making their coins interesting or significant. Florence placed on the gold coins, which were to become world-famous as florins, its graceful lily and the figure of St. John the Baptist (in 1252). Venice started its equally famous gold sequins or ducats in 1280 with the interesting types of the figure of Christ blessing in a border of stars, and of the doge receiving the gonfalon from St. Mark. These types were not entirely new; they had been already used in a less elaborate form on silver.

It must have been the florin that suggested to Henry III, that enlightened patron of art, the introduction of his beautiful gold "penny" in 1257. His example was followed by St. Louis in his *denier d'or* in 1266—an admirably executed coin of heraldic design. St. Louis must also be credited with a far-reaching innovation in the shape of the large silver piece or gros of 12 deniers, the forerunner of the English groat or fourpence, though that coin did not come into regular use until 1351. The enlarged size eventually made possible the introduction of more interesting designs, though France continued to cling to conventional patterns, and England to the conventional facing head and cross.

In the grossi of Wenceslas II of Bohemia (1278–1305) the opportunity afforded by the larger flan was seized for a fine heraldic design.

The 14th Century.—But the time of Edward III and his contemporaries is the golden age of European coinage. There is no distinction in style between the Anglo-French coins and those of the French kings, and foreign workmen were employed at the English mint. At this period there is no evidence of an independent English art. The fine period of the Anglo-French coinage closes about 1368; the gold coin of the Black Prince issued at that time is a distinct attempt at portraiture on a small scale. In England we have the beautiful, but abortive first issue by Edward III in 1343 of the gold florin and smaller denominations: the most beautiful coins in the whole English series, but demonstrably the work of two Florentines, Giorgio Chierichino and Lotto Nicolini. These coins are followed by the gold noble, the obverse bearing the king in his ship as type. In 1465 Edward IV introduced a type of rude strength, the angel, in which there is something peculiarly English, especially in contrast with the St. Michael on the French coins of a century and a quarter earlier (Philip VI) and the angelot of Louis XI.

Toward the end of the 15th century the Tudor coinage makes its appearance with a flourish; the sumptuous "sovereign" of Henry VII, first struck in 1489, is still Gothic, but effete: it mistakes restlessness and over-decoration for strength. As in England, the art of coinage in the Low Countries in the 14th and 15th centuries presents no essential difference from what is to be seen in France; Germany during the same period lags far behind the west, its coinage being monotonous and crude.

Italian Influence.—It was from Italy that the new revival was to come; and the splendour of its coinage in the last quarter of the 15th century was directly due to the sister art of the medal.

The portrait-medal founded by Vittore Pisano, with his incomparable series of portraits made between 1438 and 1449, showed the possibilities of the profile relief. After a few artists, like Enzola of Parma, had in the '60s and '70s made groping experiments in die-cut portraits on small medals, others, notably in Milan—though the attribution of the Sforza series to the Milanese Caradosso may be baseless—succeeded toward the end of the century in producing pieces which, as we have said, reached the high-water mark of portraiture in coinage. Early in the 16th century the influence made itself felt outside Italy.

It was a German, Alexander of Bruchsal in Baden, who was employed by Henry VII from 1494 to 1509, but the beautiful profile portraits by which, from 1503 onward, he left his mark on the English coinage are obviously inspired by the Italian fashion. His work sealed the doom of the facing-head on English coins although examples lingered on to the reign of Edward VI.

The Thaler.—Meanwhile Germany had taken an important step in the invention of the thaler, again the size giving greater scope to the designer. The Tyrolese guldengroschen of 1484—the earliest of the class afterward generally known as thalers—was evidently inspired, clumsy though it be, by an Italian model. It was the ancestor of all the large silver coins, thalers, dalers, dollars, scudi and crowns, of the 16th and 17th centuries. It did not add greatly to the art of coinage, which attains its highest perfection on a field of not more than an inch and a quarter. For a larger field, the medallic art, unrestricted in relief by its nonuse as currency, is proper.

Portraiture.—The development of portraiture on coins, as seen in the second half of the 15th century, must be traced to the Italian medal. Pisano's first medal, representing the emperor John VII Palaeologus, was made in 1438. It revealed the possibilities of profile portraiture on a small scale, suitable for coinage. What the medallists showed was that modern portraits, and not mere imitations of the antique, could find a place on modern coinage.

In the '60s and '70s engravers in Milan, Parma and Venice were producing both small medals and portrait-coins from dies. By the beginning of the 16th century the technical difficulties had been overcome; and soon the facility afforded by striking for the mass production of medals began to have a reaction on the medallic art. The art of coinage had reached its culmination; all future developments added nothing to its artistic content, and were due merely to increased technical dexterity.

But the medal had still a course to run. The best medallists continued throughout the 16th century to use the casting process for their most important work, even when they were also die-engravers by profession. But official patronage favoured the struck medal, satisfied with number rather than quality. The technical dexterity of the modeller continued nevertheless to increase.

In Germany especially, where the art of the medal culminated in the period from 1520 to 1540, a series of portraits was produced unsurpassed in the realism of their presentation and technique of casting. In Italy after about 1530 the cast medal continued to develop as an art that had lost its inspiration; facile, graceful but superficial, the elegant portraits of Pastorino of Siena are typical of the school.

The modeller begins to lose the sense of material; the original wax model is all he cares about and the final product in metal is merely a means of perpetuating it. By the end of the 16th century the Italian vein was worked out. Italian influence, however, had passed across the Alps. German lands, especially Austria, France and Flanders had all felt it, though none of them in the 16th century produced medallists who marked an epoch. It

remained for France in the first half of the 17th century to do for the art of the medal what Italy through Bernini did for sculpture. As masters of the baroque portrait Guillaume Dupré Jean and Claude Warin should be mentioned beside Bernini, though they too had his excessive virtuosity, as well as his brilliance. In England Thomas and Abraham Simon are almost on the same level. In Holland a native school is distinguished by hardy vigour. These developments are the last flowering of the medallic art before the dead period of the 18th century.

The 19th Century.—In the last quarter of the 19th century the monotonous academic tradition which had reigned for nearly two centuries began to break down. The French revival took its rise in F. J. H. Ponscarme (1827–1903). By the study of character in portraiture, the search for a dignified realism, and for a harmonious relation of type to background, and by such external reforms as the abolition of the raised border which had so long been the fashion, he inaugurated a return to the true principles of the art. The French school reached its zenith under J. C. Chaplain (1839–1909), but unfortunately, thanks to modern machinery, exploited with immense skill by Oscar Roly and his school, the medal in French hands became a merely pretty art, lacking virility and sincerity.

In Germany native vigour interposed, and the portraiture by such artists as the Viennese Anton Scharff (1845–1903) is of a fine seriousness.

In England Alphonse Legros (1837–1911), with a true instinct rejecting the machine-made medal, produced a remarkable series of cast portraits; but he found no successor.

Later developments are not sufficiently important to require detailed mention. We are still in the age of experiment. The immense output of medals, especially in Germany, during World War I should have revealed original artists if there were any, but the only one to rise above a journalistic level was Ludwig Gies and he often trespassed beyond the limits of his art.

There is at the present moment no lack of fine and accomplished portraiture, and although for the purposes of mass production the use of machinery is unavoidable, the better medallists, such as Theodore Spicer-Simpson, are content to produce their works by the nobler method of casting in limited editions of two or three specimens. (See METAL WORK; SEALS; GREEK ART; ROMAN ART.)

BIBLIOGRAPHY.—On the technique of making coins and medals *see* G. F. Hill, "Ancient Methods of Coining," *Numismatic Chronicle* (1922) and *Medals of the Renaissance* (1920). On the place of coins in art, the literature is confined to ancient coins: B. V. Head, *Guide to the Coins of the Ancients* (4th ed., 1895); P. Gardner, *Types of Greek Coins* (1882); K. Regling, *Die Antike Münze als Kuntstwerk* (1924); G. F. Hill, *Select Greek Coins* (1927). (G. F. H.)

TOKENS FOR WAR SERVICE

From the earliest times service of all kinds has been rewarded by honours and distinctions. We learn from Josephus ("Antiquities of the Jews") that in the 3rd century B.C. Jonathan, the high priest, successfully led the Jews in battle thereby aiding Alexander, who "sent to Jonathan, and gave testimony of his worth, and gave him *honorary rewards*, as a *golden button*, which it is the custom to give King's kinsmen." Later Jonathan received another golden button for similar service. These honorary rewards of golden buttons are the earliest form of medal to commemorate war service.

BRITISH MEDALS

War Medals.—The earliest medal in existence struck for an Englishman for war service is that awarded to John Kendal in 1480. Kendal was prior of the English Knights of St. John of Jerusalem and in 1480, relieved Rhodes. His medal is now in the British Museum.

Although decorative medals were common before her reign, Queen Elizabeth appears to have been the first sovereign to bestow a medal for particular military service to the Crown, this being the "ark in flood" medal (so called from its design) to commemorate the victory over the Armada in 1588. James I. (1603–1625) issued a medal "in reward for naval achievements" on which the design was repeated.

Under a royal warrant, dated May 18, 1643, Charles I. authorized the issue of "Badges of silver, containing our Royal image and that of our dearest son, to be achieved to wear on the breast of *every man* who shall be certified under the hands of their Commander-in-Chief to have done us faithful service in the Forlorn-Hope" (*i.e.*, the tactical advanced guard of those days and not a hopeless adventure).

During the Commonwealth, statutory provision was made for the bestowal of medals as naval awards under a minute of the council of State, Nov. 15, 1649. There was also a "Medal of the Parliament" for land service, one being awarded to Col. Mackworth, governor of Shrewsbury, as a mark of the parliament's favour. This medal was given with "a chain of gold to the value of one hundred pounds." The first English campaign medal is that issued by the Commonwealth to commemorate Dunbar, Sept. 3, 1650. A week after the battle the House of Commons authorized the medal "both for officers and men." Cromwell protested against his effigy appearing on the medal, but this was overruled, and his effigy placed thereon. The finest medals of this period are those granted to Blake, Monk, Penn and Lawson for their victory over Van Tromp, July 31, 1653. The medals are in gold, with gold chains.

One interesting medal granted by James II. was to Bishop Mew, for his services as commander of the king's artillery at Sedgemoor, 1685. Before entering the church Mew had been an able soldier, and his ecclesiastical duties had not interfered with his continued study of the military art. Almost all writers on the subject classify the "Cumberland" medal (sometimes called the "Culloden" medal) as a commemorative war medal. This is incorrect. The battle was fought on April 16, 1746, the English being commanded by the young duke of Cumberland. To commemorate his success a number of admirers formed the Cumberland Society, a rule of which was that each member on joining was to be presented with a medal. No evidence has been found to show that the victory was *officially* commemorated by the grant of a medal.

Only one medal was issued for the American War of Independence, this being awarded to a Captain Ewing who distinguished himself at Bunker Hill.

Credit is due to the Honourable East India Company for instituting the regular practice of making the grant of medals a "general distribution" and not solely to officers. Some of their early grants include the "Deccan" medal for service during 1778–84, the "Mysore" medal (1791–92) and the "Seringapatam" medal (1799), and they continued this practice until the Crown assumed the Government of India after the Indian Mutiny. The lack of medallic recognition to the rank and file prompted Davison, Nelson's prize agent, to present a medal to every man who took part in the battle of the Nile (1798). His example was followed in 1805 by Boulton, of the Soho Mint, Birmingham, who presented medals to all ranks who had taken part in the battle of Trafalgar (1805). But, it is stated, that as the medals for the men were only made of pewter they deemed them of no value and the majority threw them away. These are the only instances of medals being awarded to service men by private individuals.

British war medals enter upon a new era with those awarded to admirals and captains for Lord Howe's victory over the French on "the Glorious 1st of June" (1794), generally known as the *Navy Gold Medals*, in that the first official reference is made to *medal ribbon* in connection with them.

The Peninsula Campaign was two years old before any medals were authorized to commemorate the successful major operations therein. The battles of *Roleia* (Roliça), *Vimiera, Corunna* and *Talavera* had all been fought before the *Army Gold Medals* were instituted under general order, Sept. 9, 1810. In addition to the foregoing the *Army Gold Medal* was authorized for officers, not below the rank of battalion commander, for the following operations: *Sahagun, Benevente, Busaco, Barossa, Fuentes d'Onor, Albuhera, Ciudad Rodrigo, Badajoz, Salamanca, Vittoria, Pyrenees, St. Sebastian, Nivelle, Nive, Orthes* and *Toulouse.* Originally a separate medal was awarded for each separate operation and many officers became entitled to several medals. This,

however, caused inconvenience to the recipients and a new system was instituted in 1813 under which only one medal was to be borne by each officer entitled thereto. For the second and third occasions gold clasps, the first ever sanctioned, were added to the medal ribbon, and on becoming entitled to a fourth mark of distinction the medal was surrendered and a *Gold Cross* issued in its place, on the four arms of which were inscribed the four battles for which marks of distinction had been awarded. On becoming entitled to a fifth or further marks of distinction, gold bars inscribed with the name of each battle were added to the *Gold Cross* ribbon. The substitution of a cross for a medal was never repeated.

Of the 20 operations in the Peninsula Campaign for which medals, crosses and clasps were awarded, the Duke of Wellington had distinctions for 14, viz. (*a*) inscribed on the *Gold Cross:—Roleia* and *Vimiera, Talavera, Busaco, Fuentes d'Onor,* (*b*) clasps to the *Gold Cross: Ciudad Rodrigo, Badajoz, Salamanca, Vittoria, Pyrenees, Nivelle, Nive, Orthes* and *Toulouse.*

The first war medal to be issued to all ranks, alike in all respects, was the *Waterloo Medal*—this, at the suggestion of the Duke of Wellington.

The fact that the *Waterloo Medal,* the *China Medal* (1840–42) and the *Jellalabad Medal* (1842) were given to all ranks alike without discrimination, appears to have started an agitation amongst those who had taken part in operations for which the *Army Gold Medal* and *Gold Cross* had been awarded but for which they were not eligible, owing to their rank. In this case, the Duke of Wellington opposed granting such a medal but it was adopted as the *Army General Service Medal.* The *Military Ribband* was worn with the medal. It was usually referred to as the *Peninsula Medal,* colour being lent to the idea by Wellington's figure appearing thereon, but it included campaigns in which Wellington had no military concern. Clasps were added.

The grant of the Army G.S.M. naturally led to a similar medal being authorized for the Navy, the *Navy General Service Medal* which covered operations from 1793 to those off the coast of Syria in 1840. Clasps included: *Howe's Victory* (June 1, 1794), *Camperdown* (Oct. 11, 1797), *Nile* (Aug. 1, 1798), *Copenhagen* (April 2, 1801), *Trafalgar* (Oct. 21, 1805), *Navarino* (Oct. 20, 1827).

Later medals commemorate service in the Crimea, the Indian Mutiny, New Zealand campaigns and those in Egypt.

The Honourable East India Company followed the example of the home Government and instituted the "India 1851" medal. Four further India general service medals have been granted to cover operations from 1849–95, 1895–98, 1901–02, and from 1908 to 1928. For the late Lord Roberts' march from Kabul to Kandahar in 1880 there is a bronze, known as *Roberts' Star.* For minor campaigns, the *General Service Medal* is granted.

Gallantry Medals, Crosses or Orders.—The most famous of this class is the *Victoria Cross* instituted in 1856. All ranks and civilians are eligible for the award, to qualify for which the recipient must have performed some conspicuous act of bravery in the presence of the enemy. The ribbon now is red (claret) for all recipients, but was previously blue for the Royal Navy. Recipients who are granted a second distinction are awarded a bar. The award carries a pension. The V.C. takes precedence of all other orders and medals.

Other awards of lesser degree in this class are: *Distinguished Service Order,* instituted in 1886 and the *Military Cross* (1914); only officers are eligible for the award. *Distinguished Conduct Medal* instituted in 1854, also the *Military Medal* (1916); only "other ranks" are eligible for the award. *Meritorious Service Medal,* instituted in 1845, awarded to sergeants as a reward for distinguished or meritorious service; it carries a gratuity. *Conspicuous Gallantry Medal,* originally sanctioned for Crimean War only, reinstituted 1874 and now available for any war; only "other ranks" of Royal Navy and Royal Marines are eligible for the award. *Indian Distinguished Service Medal,* instituted 1907, only Indian officers and "other ranks" are eligible. The Royal Air Force has medals, etc., comparable to the foregoing. See also on next page under *Other Medals and Decorations.*

Good Conduct Medals.—There are a number of medals granted for good conduct combined with a prescribed number of years' service, the conditions of eligibility varying according to the service, and whether Regular, Auxiliary, Colonial, etc. The first of these medals was the *Long Service and Good Conduct Medal* instituted in 1830.

UNITED STATES MEDALS

The premier decoration of the United States is the *Medal of Honor* which is comparable to the *Victoria Cross.* It was instituted in 1862 as a reward for conspicuous acts of bravery during the Civil War. In the course of time the details of the design have changed; the present description of the Army medal is a five-pointed star superimposed on a wreath, in the centre of the star he head of *Minerva,* surrounding which is a circle inscribed "UNITED STATES OF AMERICA." The star is suspended from a bar attached to the two top points, and on the bar is inscribed "VALOR," above which is the American Eagle. Attached to the eagle's head is a ring through which passes the ribbon. The ribbon is light blue with stars embroidered thereon, and the medal is worn round the neck. The Navy medal differs in a few details from the Army pattern. This medal takes precedence of all other United States decorations. "Medal of Honor" lapel buttons are optional for wear in civilian clothes; they are hexagonal rosettes made of light blue silk with 13 white stars. There was a *Merit Medal,* awarded with the "Certificate of Merit" for which only enlisted men were eligible, but this was abolished in 1918.

War commemorative medals follow the British practice. An interesting example is the *Civil War Medal,* on the obverse of which is a portrait of Lincoln, surrounded by an inscription taken from his famous Second Inaugural: "WITH MALICE TOWARDS NONE, WITH CHARITY FOR ALL." On the reverse is inscribed "THE CIVIL WAR, 1861–1865." The "Indian Wars" Medal is also interesting from the fact that the reverse was copied for reverses of many other campaign medals.

MEDALS OF OTHER COUNTRIES

France.—Before 1802 gallantry in the field was awarded by grants of swords of honour, muskets of honour and other weapons but in that year Napoleon instituted the *Legion d'Honour.* The original cross of the Legion of Honour was a white enamel gold badge, with five rays of double points, each point tipped with a silver ball, the whole on a wreath of oak and laurel: in the centre of the obverse, Napoleon's effigy with "NAPOLEON" inscribed around it. The present badge is much the same in appearance but instead of Napoleon's effigy on the obverse there is a female head, and inscribed round it, "REPUBLIQUE FRANÇAISE, 1870." The order is divided into five grades: Grands Croix, Grands Officiers, Commandeurs, Officiers and Chevaliers. The Legion of Honour is the premier order of France and is only conferred for gallantry in action or for 20 years' distinguished military or civil service in peace. The *Médaille Militaire,* instituted in 1852, is comparable with the British D.C.M. It is only conferred upon general officers in command of armies and to N.C.Os. and men of the Navy and Army for distinguished service in action. It was awarded to the late Field-Marshal Lord French. As regards commemorative war medals the first is interesting, viz., *St. Helena Medal,* instituted in 1857 for operations between 1792 and 1815. The medal is bronze and bears on one side the effigy of Napoleon, and on the other, in French, "Campaigns of 1792 to 1815. To his comrades in glory, his last thought. St. Helena, May 5, 1821." Another interesting war medal is the *Pontifical Cross,* instituted in 1867, by Pope Pius IX., and granted to all members of the French forces who took part in the defence of Rome in 1867.

Germany.—A renowned German decoration was the *Iron Cross,* instituted in 1813, as a reward for distinguished service in the War of Liberation. It was revived for the Franco-Prussian War of 1870 and was again issued for service in the World War. The cross is a Maltese Cross of cast iron edged with silver. On the upper link is a crown, on the lower link the date of the campaign, that for the World War being "1914," in the centre the initial or initials of the sovereign at the date of issue. There are three classes of the Order of the *Iron Cross.* The Grand Cross, dou-

ble the size of the ordinary cross, is worn round the neck, and is awarded solely for the winning of an important battle, or equivalent exploit. With the rank and file the cross carries with it a gratuity. *The Order of Military Merit* (*Prussia*), founded in 1665, was bestowed for conspicuous war service.

Belgium.—The *Order of Leopold II.* was instituted in 1900. There are six classes. It is awarded to N.C.Os. and men and "ranker" officers for exemplary service after a number of years (20–30). The *Ordre de la Couronne*, instituted in 1897, was originally the premier order of the Independent Congo State but was transferred to the Ministry of Foreign Affairs in 1910. It is awarded to officers after a number of years' exemplary service (20–32) and to N.C.Os. after 38 years' exemplary service. The *Military Medal*, instituted in 1902, is comparable with the British Military Medal.

Japan.—The *Order of the Rising Sun*, instituted in 1875, is awarded to all ranks of Army and Navy for gallant service in war or distinguished service in peace. The *Order of the Sacred Treasure*, instituted in 1888, is awarded to both military and naval officers for meritorious service. The *Order of the Golden Kite* was instituted in 1891. There are several classes, the higher for officers and the lower for N.C.Os. and men. It therefore corresponds approximately to the British D.S.O., D.S.C., M.C. and D.C.M. The medal to commemorate the Russo-Japanese War of 1904–05 is made of light bronze.

Italy.—The *Order of Saint Maurice and Saint Lazarus* was founded in 1434, and revised in 1831, 1837 and 1855. The *Military Order of Savoy*, founded in 1815, is awarded for special distinguished war service. Medals for military valour are awarded for acts of bravery in much the same manner as British gallantry medals. The *Messina Medal* was awarded by the King of Italy to officers and men of the British men-of-war and to certain others who assisted in succouring the injured after the terrible earthquake at Messina and Reggio in Dec. 1908. The ribbon is green with white edges.

Serbia.—The *Order of the White Eagle*, instituted in 1883, consists of five classes. The badge consists of a double-headed eagle in gold, ensigned with a crown. The *Star of Kara George*, instituted in 1904, consists of four classes.

WORLD WAR MEDALS AND DECORATIONS

By resolutions passed by a committee of the Peace Conference in Paris in March 1919, it was decided that the victorious Allies and associated Powers (*i.e.*, Great Britain and her dominions, France, Belgium, Italy, Spain, United States of America, Japan, etc.) should have a medal common to the Powers in general design. The medal was to be called the *Victory Medal* and was to be round, made in bronze (36mm. wide), the colour, surface, thickness and attachment to be similar to the French Medal of the 1870 war, on the obverse a winged figure of Victory full length in the middle, on reverse the inscription, "The Great War for Civilization," in the language of the country granting the medal, the rim plain. The ribbon to be identical for all countries and to consist of two rainbows joined by the red in the centre.

One of the objects of issuing a medal similar in design in all countries was to obviate the interchange of Allied commemorative war medals. No clasps have been issued with the medal except in the U.S. The exact conditions under which the medal was awarded varied in each country, but generally it was issued to all who went into a theatre of war in any capacity between the first declaration of war in 1914 and the date of the Armistice, Nov. 11, 1918. In the British service it was also granted for post-Armistice operations in North Russia and Siberia, ending on Oct. 12, 1919, and in Trans-Caspia, concluding on April 17, 1919. Also in the British service an emblem in the form of an oak leaf in bronze was placed on the Victory Medal to indicate that the recipient had been mentioned in despatches during the World War.

OTHER MEDALS AND DECORATIONS

Great Britain.—(*a*) *1914 Star* (commonly known as the Mons Star), instituted in 1917, and awarded to all ranks, including nursing staffs, who actually served in France or Belgium on the establishment of a unit between Aug. 5, 1914, and Nov. 22–23, 1914. (*b*) *1914–15 Star*, instituted in 1918, similar in design to the *1914 Star*. (*c*) *British War Medal*, instituted in 1919. In general terms it was granted to all personnel of the Army who served overseas in a theatre of operations in any capacity during the war, and to the Navy for one month's service during the war. (*d*) *Mercantile Marine War Medal*, granted to members of the Mercantile Marine for service during the World War; (*e*) *Territorial Force War Medal*, instituted in 1920, granted to members of the T.F. and T.F. nursing service for service outside the United Kingdom during the war subject to certain conditions (those awarded the *1914 Star* or *1914–15 Star* were ineligible for the T.F.W.M.); (*f*) *Military Cross*, instituted in 1914, an army decoration for which only captains, junior officers and warrant officers are eligible; (*g*) *Distinguished Service Cross* (established as Conspicuous Service Cross in 1901) re-named in 1914 and its award extended to all naval and marine officers below the relative rank of lieutenant-commander; (*h*) *Distinguished Service Medal*, instituted in Oct. 1914 for other ranks of Royal Navy and Royal Marines; (*i*) *Order of the British Empire*, instituted in June 1917, as a reward for war service in any capacity; (*j*) *Military Medal*, instituted in 1916; all other ranks are eligible for the award; (*k*) *Silver War Badge*, instituted in 1916, issued to all ranks who served at home or abroad during the World War and who on account of age, or physical infirmity arising from wounds or sickness caused by military service, had been compelled to leave the forces; (*l*) *Royal Air Force*. The following decorations were instituted under a royal warrant dated June 3, 1919, and have been awarded: *Distinguished Flying Cross, Air Force Cross, Distinguished Flying Medal* and *Air Force Medal*.

United States of America.—(*a*) *Distinguished Service Cross, Army*, instituted Jan. 12, 1918, awarded to those who since April 6, 1917, have distinguished themselves in connection with military operations in circumstances which do not justify the award of the Medal of Honour. (*b*) *Distinguished Service Medal, Army and Navy*, instituted Jan. 12, 1918, awarded for exceptionally meritorious service. (*c*) *Navy Cross*, terms of award similar to *Distinguished Service Cross, Army*. The United States *Victory Medal* has battle clasps.

France.—*Médaille de la Reconnaissance Française*, instituted in 1917, is awarded to persons who performed acts of devotion in the public service. The following war medals were also issued: *Médaille Commémorative d'Orient* and *Médaille Commémorative Française de la Grande Guerre*.

Turkey.—For the Gallipoli campaign Turkey issued a white metal five-pointed star, in the centre of which is the Sultan's cypher, and the characters representing "El Ghazi" (The Victorious), below the date "333" (*i.e.*, 1915). The ribbon is scarlet moire with a white stripe towards the edges.

Japan.—This medal is similar to that granted for the Russo-Japanese War. The ribbon is dark blue with a broad white stripe.

Egypt.—*The Military Star of the Sultan Fouad* was instituted in 1919 for officers of the Egyptian Army who are mentioned in despatches for post-Armistice operations.

Belgium.—*Croix de Guerre*, instituted in 1915, awarded for exceptional acts of bravery. Medal *De la Reine Elisabeth*, instituted in 1916, and awarded to ladies, without distinction of rank, who assisted Belgians during the war. Other medals are *Médaille du Roi Albert; Croix Militaire; Décoration Militaire; Médaille de l'Yser*. Three medals for the general campaigns on the Continent and in Africa were also struck: *Médaille Commémorative de la Campagne 1914–1918, Médaille Commémorative de la Campagne d'Afrique 1914–18*, and *Étoile de Service du Congo*.

Rumania.—*Order of St. Michael The Brave*, instituted in 1916, solely for service in the field.

Portugal.—*Victory Medal* and *Medalha commemorativa das campanhas do Exercito Portugues* (to which were added clasps) were issued for the general campaign.

Germany.—Several medals were issued in Germany of which the following are the most important: (*a*) a silver medal was struck for the *March on Paris*. On the obverse is the bust of Gen. von Kluck and "1914–1915"; reverse, a naked fury on horse-

back carrying two blazing torches and "Nach Paris, 1914"; (*b*) a bronze medal was struck for the anticipated German entry into Paris. Obverse the Arc de Triomphe; among rays spreading from the top "1871–1914"; in the background the Eiffel Tower, and inscribed round the whole, "Entry of the German Troops into Paris." Reverse, the 1914 Iron Cross and "Nach aussen entschlossen. Nach innen geschlossen" (Resolute in the face of the enemy, united on the home front). An attempt was made to suppress it when the German hopes were not realized, but a few specimens are in existence, one being in the British Museum; (*c*) the Failure Before Paris is commemorated by a cast-iron medal. Von Kluck's bust with "1914–1915" on the obverse, with an eagle perched on a gun-emplacement, gazing at distant "Paris" on the reverse; (*d*) the new Triple Alliance is commemorated by a bronze medal, bearing on the obverse the busts of Kaiser Wilhelm II., Kaiser Franz Josef and the sultan of Turkey, and the inscription "Glory to God alone." Reverse, eagle perched on an oak branch, with the inscription "Brotherhood in arms, 1915, Germany, Austria-Hungary, Turkey"; (*e*) Russian defeat at Tannenberg: medal cast in iron and bronze. Obverse, bust of Hindenburg; reverse, "Tannenberg–Ortelsburg 1914" and "Queller of the Russians, liberator of East Prussia"; (*f*) the battle of the Falkland isles, Dec. 8, 1914, is commemorated by a bronze medal; (*g*) the Submarine War medal is cast in bronze. Obverse, bust of Admiral von Tirpitz. Reverse, Neptune with trident, seated on conning-tower of a submarine, shaking his fist at the distance where are two British sailing ships, one sinking; in middle distance, another submarine, inscription, "Gott strafe England, 18 Februar, 1915"; (*h*) the sinking of the "Lusitania." Obverse, ticket office of the Cunard company in New York, with Death issuing tickets to a crowd of passengers, motto "Business First." Reverse, the Lusitania (showing guns, aeroplanes, etc., on board) sinking. Inscription, "No contraband" and "The liner Lusitania sunk by a German Submarine, May 5, 1915." The liner was sunk on May 7 not May 5. "The authenticity of this medal has sometimes been denied, but the fact that it was issued has been frequently admitted by responsible German authorities as well as by the artist (K. Goetz) himself" (vide *Historical Medals in the British Museum*); (*i*) the Zeppelin attack on London on the night Aug. 17–18, 1915, was commemorated by a medal cast in iron; (*j*) the failure of the Allies Dardanelles Expedition was commemorated by a satirical medal in bronze. (T. J. E.)

H. Mayo, *Medals and Decorations of the British Army and Navy* (up to 1895), a most authoritative work; T. Dorling, *Ribbons and Medals*, a useful handbook relating to all countries.

NUMMULITE: *see* PROTOZOA.

NUN, a member of a community of women, living under vows a life of religious observance (*see* MONASTICISM; MONK).

NUNATAK, a name applied in Greenland to a hill or mountain peak appearing above the surface of a glacier. Greenland is for the most part covered by an ice-cap of a certain thickness which moves slowly downwards to the sea. It will rise upwards and pass over a barrier if there is no outlet, but it will flow between and around mountain peaks leaving them standing as hills (nunataks) above the general surface of the ice-cap.

NUNCIO, a representative of the pope sent on diplomatic mission, sometimes called *Nuntius apostolicus*. The nuncios are of lower rank than the *legati a latere*, but have practically superseded them as ambassadors of the papacy. Nuncios were permanently established during the 16th century.

NUNCOMAR or NANDA KUMAR (d. 1775), Indian official, best known for his connection with Warren Hastings (*q.v.*), was governor of Hugli in 1756, and in 1764 he was appointed collector of Burdwan in place of Hastings, which resulted in a long-standing enmity. In 1775, when Hastings was governor-general, Nuncomar brought accusations of peculation against him, which were entertained by Francis and the other members of council inimical to Hastings. While the matter was still pending Nuncomar was indicted for forgery, condemned and executed. Warren Hastings and Sir Elijah Impey, the chief justice, were both impeached, and were accused by Burke and afterwards by Macaulay of committing a judicial murder; but Sir James Stephen, after investigation, reached an opposite conclusion.

See Sir James Stephen, *The Story of Nuncomar* (2 vols., 1885); and H. Beveridge, *The Trial of Nanda Kumar* (Calcutta, 1886).

NUNEATON, a municipal borough in the Nuneaton parliamentary division of Warwickshire, England, 9.7 mi. N.W. from London by the L.M.S.R. It is on the river Anker and the Coventry canal. Pop. (1951) 54,408. Area, 18.4 sq.mi. The prefix of the name of the town is derived from a priory of nuns founded there in 1150. In the reign of Henry III a weekly market was granted to the prioress. Nuneaton was incorporated in 1907 and the boundaries were later extended. The church of St. Nicholas consists of nave, chancel and aisles, with a square embattled tower having pinnacles at the angles. The grammar school was founded in 1552. The ribbon industry is of less importance than formerly. The weaving of worsted goods is carried on, and there is a considerable industry in the making of bricks, tiles and drain pipes. Local mines of coal and ironstone employ many hands.

NUNEZ, PEDRO (PETRUS NONIUS) (1492–1577), Portuguese mathematician and geographer, was born at Alcacer do Sal, and died at Coimbra, where he was professor of mathematics. He published a translation of portions of Ptolemy (1537), and a treatise in two books, *De arte atque ratione navigandi* (1546). His clear statement of the scientific equipment of the early Portuguese explorers has become famous. A complete edition of all his writings appeared at Basel in 1592.

See F. de B. Garcão-Stockler, *Ensaio historico sobre a origem e progressos das mathematicas em Portugal* (Paris, 1819); R. H. Major, *Prince Henry the Navigator* (London, 1868, p. 55).

NUÑEZ CABEZA DE VACA, ALVARO (*c.* 1490–*c.* 1564), Spanish explorer, was the lieutenant of Pamfilo de Narvaez in the expedition which sailed from Spain in 1527; when Narvaez was lost in the Gulf of Mexico, Cabeza de Vaca succeeded in reaching the mainland to the west of the Mississippi, and, striking inland with three companions, reached the city of Mexico in 1536. Returning to Spain in 1537, he was appointed "adelantado" or administrator of the province of Rio de la Plata in 1540. Sailing from Cadiz in the end of that year, after touching at Cananea (Brazil), he landed at the island of St. Catharine in March 1541. Leaving his ships to proceed to Buenos Aires, he set out in November with about 150 men to find his way overland and reached Ascension (Asunción) for the relief of his countrymen there the next year. Though successful, he was sent home under arrest in 1544, and in 1551 was banished to Africa by the council of the Indies for eight years. He was recalled and appointed judge in Seville, where he died not later than 1564.
